One of the common faults of the times is an indisposition to investigate on the part of the masses. We take too much for granted. A very common answer to a demand for a reason for a time honored custom is, "Why, I have heard it all my life. Don't everybody say so?"

It would be a strange contradiction in the nature of things if sugar and candy in moderation should be hurtful to the human body in any way, for sugar is a constituent of every article of food we can name, there is not a vegetable out of which it cannot be made, not a ripe fruit in our orchards which does not yield it in large proportions, and it is the main constituent of that "milk" which is provided for the young of animals and men all over the world. Perhaps the child has never lived which did not love sweet things beyond all others; it is an instinct, a passion not less universal than the love of water. A very little child can be hired to do for a bit of sugar what nothing else would. The reason of this is, that without sugar no child could possibly live, it would freeze to death; it is the sugar in its food which keeps it warm, and warmth is the first necessity for a child.

But to use this information intelligently and profitably, it must be remembered that sugar is an artificial product, is a concentration, and that, if used in much larger proportions than would be found in our ordinary food, as provided by the beneficent Father of us all, we will suffer injury. We should never forget that the immoderate use of anything is destructive to human health and life if persevered in. The best general rules to be observed are two:

1st. Use concentrated sweets at meal times only. 2d. Use them occasionally and in moderation. — *Hall's Journal of Health.*

AURAL DISTURBANCES FROM BATHING.—The frequency of attacks of aural inflammation from bathing demands more than a mere mention, for complete deafness may result from the injuries to the ear from this cause, and partial impairment is frequent. These injuries from bathing are mainly due to the fact that man is not afforded the protection to the ear that amphibious animals possess, and hence the water may act injuriously in various ways. In surf bathing the mere force of contact, when the water flows into the ear, may injure the tympanic membrane, and when an incoming wave dashes against the face, water may freely enter the mouth or nose, and thus be driven into the ears through the eustachian tubes. The presence of cold water for a long time in the canal leading to the ear, as when much diving is done, may set up much inflammation in the canal or in the tympanic membrane, which may extend to the drum cavity itself. Ill effects may be produced by allowing the ears, head and body to dry in a current of air after coming out of the water. Sea water is probably more obnoxious than fresh, on account of its comparatively low temperature and the large quantity of salt it holds in solution. A long continuance in the water should be avoided. The Russian bath should not be taken without protecting the ears when the cold plunge is used. Diving is, however, the most dangerous practice connected with bathing, for it is difficult to keep water from entering the ears, or nose or mouth. In diving, the pressure of water on the tympanic membrane from without may cause vertigo. Even syringing the ears gently is known in some instances to occasion decided dizziness. — *Harpers Magazine.*

EATING FOR HEALTH.—One of the most prolific causes of disease is improper eating, or taking food when the stomach is not prepared to digest it. If food is taken at the proper time, and in not too great a quantity, and is composed of perfect cell structure, the stomach will faithfully perform its duties, and the process of assimilation will build up the system with healthy material. But if food fails to digest, the heat of the stomach soon rots it. A portion of this putrid matter is absorbed by the lacteals, taken up by the circulation, and deposited in various portions of the system to rebuild torn down tissue. Can such a condition of the human organism be an index to perfect health? Yet such states exist. People often eat, sometimes heartily—not because they are hungry, but because it is meal-time; and unwittingly violate a hygienic law which will result, if continued, in impaired health with all its concomitant evils. Many children are fed to death by kind, indulgent mothers—actually crammed with pastry, candy and nuts until their entire system is diseased, a mass of putrescence made from decayed vegetable and animal matter. We need not say anything of the evil effects of stimulants and excitants. The thousands of slaves to this form of dissipation, the dreary homes, ruined constitutions, and physical recks speak more forcibly than words of the baneful effects of unnatural stimulation. Drinking and eating, in short, cause more ills than any other two things in the world. And until people learn to govern their appetites these causes will breed disease and misery.

MORNING WALKS NOT HEALTHFUL.—It is a great mistake, says a medical writer, to suppose that a morning walk or other form of exercise before breakfast is healthful; the malaria which rests on the earth about sunrise in summer, when taken into the lungs and stomach, which are equally debilitated with other portions of the body from long fast since supper, is very readily absorbed and enters the circulation within an hour or two, poisoning the blood, and laying the foundation for troublesome diseases; while in winter the same debilitated condition of these vital organs readily allows the blood to be chilled and thus renders the system susceptible of taking cold, with all its varied and too often disastrous results. Some will say, look how healthy the farmer's boy is, and the daily laborers, who go to their work from one year's end to another by "crack of dawn!" My reply is, if they are healthy, they are so in spite of these exposures; their simple fare, their regular lives and their out-door industry, give their bodies a tone, a vigor, a capability of resisting disease, which nullifies the action of malaria to a very considerable extent.

ONE CAUSE OF INSANITY.—At a recent meeting of German doctors interested in the treatment of insane persons, a paper was read by the director of the Brunswick State Lunatic Asylum, in which he maintained that much of the increase of insanity in Germany is attributable to the excessive amount of work imposed upon the pupils in the national schools.

Grasshoppers upon the Pacific Coast.

The visitations of locusts upon several different sections of the Pacific coast have brought much hardship and loss upon the agriculturists. It is true that the pests did not spread from the mountain valleys upon the great plains as it was feared they might, from the great abundance of them and the vigor of their egg-disposing last year. This threatened invasion was fortunately not realized, but there have been considerable numbers of the insects here and there in the San Joaquin and Sacramento valleys, and their presence has occasioned some damage and much alarm. This being the case we propose to give an illustrated chapter upon the destructive locusts, so that all readers may distinguish the different species, may understand their method of reproduction and recognize some of the parasites which do much in reducing their numbers. The basis of what we shall write is an article lately prepared for the *Evening Bulletin*, of this city by Prof. J. G. Lammon, who is the thesaurus of locust learning on this coast, and for the most of the engravings which we introduce we are indebted to the courtesy of the *Bulletin* proprietors.

True locusts or grasshoppers, are insects of the straight-wing order (*Orthoptera*). They have a large head, short and stout feelers (an-

tenae), month furnished with strong sidewise moving jaws, and long, strong hind legs. The female abdomen terminates in four short horn-like organs arranged in pairs, one moving outward and upward, the other pair outward and downward when drilling holes in the earth for her eggs. The abdomen of the male rounds upward at the end like the prow of a boat.

Locusts are divided into many groups, comprising hundreds of genera and thousands of species differing from each other, chiefly by microscopic characters, but for the purposes of this article it is only necessary to distinguish the two genera concerned in the present California invasion.

The first genus to be considered is *Caloptenus*. The members of this large genus may be at once known by the presence of a curious spine or blunt thorn, like a yellow awl-point, which they bear under the neck, between the fore legs; also the males have the last abdominal segment greatly enlarged as well as upturned. There are 29 species in the United States, but three of which are found on the Pacific coast, the "Hated locust" (*C. spretus*), the "Red-leg" (*C. femur-rubrum*), and the "Lesser" (*C. atlantis*). All of these are migratory, terribly destructive, and are known to have caused the great damage to the interior—and are suspected of aiding in the great invasion of 1838 and 1855, on the Pacific coast.

The "Hated locust" (*Caloptenus spretus*), Fig. 1, is usually one and one-quarter to one and one-half inches long, of a reddish brown color, with darker spots on body and wings. The long wings, on which it depends for its long flights of sometimes a thousand miles, extend a quarter of an inch beyond the body. The tip of the male abdomen is distinctly notched.

The "Red-leg" (*Caloptenus femur-rubrum*), Fig. 2, is shorter, while of the same thickness, generally of a darker hue, while the apex of the male abdomen is truncate, as if cut squarely off.

The second genus, alluded to above, is the *adipoda* or "big legs." This is a smaller genus of usually non-migratory and harmless locusts. But one species has, for some mysterious reason, become migratory in California to the extent of a few miles annually, and is then very destructive. This genus is without the curious spine under the neck, having a rounded Adam's apple instead, and the male abdomen is not enlarged, but tapers to a point. This principal species of the genus, the one with which we are concerned, is called the "Atrocious locust," (*Edipoda atrox*), Fig. 4.

The females are about an inch and a quarter long, of a light gray or a grayish-yellow color; the males a quarter shorter, and of a lighter yellowish or straw color. The males outnumber the females four or more to one, and are often mistaken for another species.

The "Atrocious locust" is found normally scattered all over the country, but this coast seems to be its headquarters or habitat, where the conditions favor its permanent residence and full development, and where, from Santa Barbara and Fresno to Sacramento and Shasta, loud complaints have often arisen of its swarming in immense numbers and eating the crops. The Atrocious locust (*Edipoda atrox*) is the grasshopper most frequently seen in the vicinity of the bay, and even on the streets of San

fruit trees, first devouring the leaves, then the fruit and twigs.

At Reno this season another large, green locust, over two inches long, is found following the bad example of the *Caloptenus* family (to which his long neck-spine alludes him) in defoliating the fruit shrubs and trees, being especially fond of roses and poplars. Also the Coral-wing grasshopper is seen trooping along with the gourmands, and the large, gray, long-winged, but harmless "Clapper locust" follows lazily after. Still another, the large, green-striped locust is too short-winged for flight at all, and wisely keeps to his eating of the umbellifer plants along the ditches, actually doing man a service by eating off the poison wild parsnip so fatal to his cattle.

The process of reproduction of the locust family is shown so well by the engravings that few words are necessary. Fig. 5, a, a, a, shows the female locust in different positions ovipositing; b, is the egg pod lifted out of its place in the ground and the end broken off to show the eggs; c, is a few eggs loose upon the ground; d, shows sections of the hole in the ground, one being filled with eggs, the other being filled; f, shows an egg shell covered up. Fig. 7 shows different views of the egg mass somewhat enlarged.

Fig. 6 shows the character of the egg and the embryo as seen with the microscope. Below is the egg with its cell-like covering, which is magnified still more at one side; above is the inner shell and the young just before hatching. Fig. 8 shows in magnified form the anal char-

acteristics of the female and the organs which participate in ovipositing. The egg appears emerging from the body.

Parasites of the Locust. One of the grandest laws in nature is that every animal, every plant, meets in time with check. Even the slowest breeding animal would soon overrun the country, were the counteracting influences by any means removed, while the more prolific species would do so in an incredible short space of time. Mother Nature, kind alike to all and cruel to all, advances her grand purposes, maintaining alive her myriads of species, each warring upon others and gaining temporary supremacy, succumbing only when in consequence of changed conditions, one species after another becomes to weak for its competitors, and is exterminated.

Something over 50 kinds of insects that prey upon the locust have been described, including wasps as large as itself, and little parasitic mites no larger than pin-heads, but which, by their great number, speedily suck the blood and soon kill their host.

DESTRUCTIVE LOCUSTS ON THE PACIFIC COAST, THEIR METHOD OF REPRODUCTION AND THE PARASITES WHICH PREY UPON THEM.

Francisco, so he may be caught and studied by any one. Ordinarily it is harmless by its fewness in numbers, but at any season, favored by Mother Nature, it may become immensely numerous and destructive, as seen now in eastern Oregon, eastern and southern California.

Locust invasions, which occur suddenly by high-flying insects, which, when they alight, scramble about and devour every green thing, even to the bark of trees, must be some members of the long-winged, migrating *Caloptenus* family described, against which there is no remedy. The ancient Egyptian plagues and the present Asiatic locusts, as also the destructive species of South America and Mexico, belong to the same great class of spine-bearers.

The Atrocious locust, which is usually few in numbers and non-migratory, has for three years past devastated Sierra valley, and last year sent colonies out to the south and west into Truckee Meadows and the valleys of Taboe lake, Donner, and the high valleys about the railroad pass, and this year they are swarming more or less over the whole region.

What has often been noticed at the East is seen here too—all the locusts of the region go on the war-path together, at least, as far as the short wings of some of them will allow. It seems some favoring conditions of nature cause their rapid increase, and migrating and destructive eating are matters of necessity with them. So, here in all the afflicted region, locusts at some time of the year are found in vast numbers, and each devours his favorite food.

First, the "Atrocious" locust appears early in July, and attacks grain and grass on the high and dry localities, though he can, if pinched, relish rank growths of swamp grass and tule. Later comes the bright little "Lesser locust," attacking the heavier plants along the water courses and the garden vegetables. The "Red-leg" brigand lastly pounces upon the shrubs and

structure in Sierra valley, is called the "large white grub," the larva of an insect whose full-grown form was unknown until this spring, but now known to be the larva of a "hover fly" (*Bombus*), species not determined. The same larva has excited great interest in the interior by its effective onslaught upon the eggs of locusts. It is shown in enlarged form in Fig. 12. It seeks out a nest of eggs, eats the contents of the whole nest, 24 to 32 eggs, one by one, pushes the shells aside, while his own body, big and fat with the feast, fills the whole case, in which condition he curls up and enters upon his long winter's nap. The dormant stage lasts till spring, during which time the grub is about half an inch long and one-fifth thick, being largest in the middle and tapering slightly towards its head and tail. In this state several specimens at different times have been sent to Prof. Riley, at Washington, but he failed to perfect them in his vivarium. However, the question has been solved this spring in Sierra valley. Some earth, with an ascertained number of this larva therein, was carefully watched under glass. In July a beautiful little velvet-bodied fly, a species of *Bombus*, appeared, having a long, black beak, with which it sucks nectar from flowers, to which it swiftly darts, then hovers above them like a humming-bird while sipping the nectar. To the services of this grub are the citizens of the north end of Sierra valley mainly indebted for untouched crops the present season, where for three years the locust has rioted, but where last fall its nests were soon emptied by this gourmand. The full-grown fly was frequently noticed in the fields about Franktown and around Reno, in August, and no doubt here, as elsewhere over the interior, this little fly is the avenging Nemesis to the locust.

The harvest throughout British Columbia has been abundant this season.

Plumas County Mining Interests.

From the *Greenville Bulletin*, a new journal started on the 29th ult. at Greenville, Plumas county, we take a resume of the mining interests of the county. The *Bulletin* starts in well by giving a good deal of local matter, and in its salutary says: With the political contest we shall take no sides, preferring to devote our attention and energy to the advancement and upbuilding of this part of the country, and to a faithful record of its resources, capacities, possibilities and progress. Our motto will be, "Indiana valley and Plumas county first, the world afterward."

The permanency and merit of the mines of the Greenville district are fully entitled to all the attention they are now receiving. The continued developments of the numerous quartz ledges now being worked are constantly attracting the attention of new capital, and the district, for gold quartz mining, promises to equal any in the State. The splendid and extensive developments of the Green Mountain mine places it among the best of the permanent producing mines of the State. The plant is extensive, and when the new 60 stamp mill, now fast approaching completion, is running, the crushing capacity, 92 stamps, will be the greatest of any mine in California. The new mill is first-class in its appointments. The cable tramway, now nearly completed, will be of capacity sufficient for all demands liable to be made on it.

The new Green Mountain mill will be ready to run in two weeks. The company have purchased the Cariboo water pipe, which they will lay across the slide on the Round Valley and Green Mountain ditch. The company have expended a large amount of money every winter repairing the ditch across the slide. The pipe will stop all further expense.

The Cherokee mine, adjoining the Green Mountain on the west, presents a very busy camp. The company have been pushing the reopening of this mine with vigor. A large amount of work has been done the past summer, and before winter the work will have so far progressed as to be unimpeded by storms.

The development on the Kettle mine shows some very rich ore. The croppings show remarkably rich ore, the ledge of which the company are now running for. The new hoisting works will have all the necessary improved machinery. The lower levels of this mine have produced very richly, and a large amount of bullion has been turned out by the old Kettle company. The development of the property is very promising. The company has just completed a fine 20-stamp water-mill.

The Plumas National mine has made some very valuable developments in their No. 3, or lower tunnel. The main pay chute of this mine is over 500 ft. in length in the No. 2 tunnel, with good ledge and pay still in the face, going west. This mine is rich in sulphurets. The company is now making extensive improvements in their mill, adding thereto seven Frue concentrators, to collect the sulphurets, and will shortly erect a furnace and chlorination works.

The No. 3 tunnel has struck the ledge within 60 ft. of the mouth of the tunnel, which from this point to No. 2 will give over 450 ft. of back on the incline of the ledge, and remarkable leach on the vein. The supply of ore is years ahead of the present capacity to crush it. The Southern Eureka mine has been purchased by San Francisco and New York capital. The company have made a milling test of the ore, the results of which have been most satisfactory. A lower tunnel is being run, now in some 200 ft. They are now negotiating for a 10-stamp steam mill.

At the Gold Stripe mine a fine body of ore is being opened in the Goodwin part of the mine. The pay chute is over 140 ft. in length, and a shaft sunk on it 60 ft. There are 200 ft. of back to this chute. The Lawrence ledge of same mine is opening out good ore. No. 3, Gold Stripe tunnel, is some 1,600 ft. in length, developing the whole mine. Two fine pay chutes of ore have been cut through. A new ledge has lately been opened, showing a fine body of quartz about 13 ft. wide, with perfect walls.

The Indian Valley mine, adjoining Greenville, gives promise of soon again being added to the list of producing mines in this district. This mine has always had the reputation of being one of the best in the county, but circumstances have prevented its being worked as its merits deserve. It has lately passed into the hands of some San Francisco gentlemen, who have been prosecuting developments that have opened out a new body of very fine grade ore, and the probabilities are the mine will be put in shape to be worked at an early date. The two mills will give a capacity of 56 stamps on this and the Union mine adjoining, part of the same property.

The Savercool mine, near Prattville, has been sold to a syndicate representing Sacramento and New York capital, for \$35,000. The company have contracted for a 40-stamp mill, to be in running order in December. The mine gives promise of opening out big. It is rumored the Dutch Hill gravel mines are being negotiated for by some San Francisco mining men. A number of experts have been examining the property, and report well of it.

The Round Valley Reservoir Company will commence next week to clean out the entire length of their ditch. Over 2,000 ft. of 22-inch heavy iron pipe will be placed to conduct the water around the Indian Valley mine. The company will employ about 60 men, and hope to complete the work in a short time.

USEFUL INFORMATION.

PAPER BARRELS FOR OIL.—In view of the anticipated production of oil in this State, in quantities sufficient not only for home consumption but also for exportation, the following item may well be worth careful consideration: "An agent of the Standard Oil Company recently visited Hartford for the purpose of finding out whether it would be desirable to obtain of the American Paper Barrel Company of that city the enormous supply of barrels annually required by the former firm. The oil company cannot make its own wooden barrels so cheaply as it can purchase paper ones, which, if furnished at even half a cent less cost, would enable the company to save \$150 per day. The oil company own factories in Cleveland and Toledo which turn out daily 30,000 iron-bound and blue-painted wooden barrels at a cost of \$1.35 a barrel. Machines are used which put on the iron hoops at the rate of 1,200 a day, and each of these machines requires a man and two boys to attend it. Even the painting is done by machinery. If the oil company can be supplied with paper barrels at the rate of \$1.30 each, it can realize the great saving of \$9,000 a week. The American Paper Barrel Company, however, is not quite prepared to put their barrels on the market, but eventually these barrels will undoubtedly supersede wooden ones for oil and for many other purposes."

NATURAL SPREAD OF THE APPLE TREE IN SOUTH AMERICA.—It is surprising how quickly the vegetation of many countries settled by Europeans has been modified. A writer in *Petermann's Mittheilungen* on the flora of Chile south of the Valdivia river, states that the scenery between the Rio Buea and its winding alluvial remiads one very much of home. In the park-like prairies, associated with *Fagus obliqua*, *n. deciduous* hesh, are numerous scattered apple trees, originally introduced from Europe. The apple tree has spread from Valdivia to Osorno, and even crossed the Andes into northwestern Patagonia, and thence eastward. Indeed, it has become so widely spread and so general, that the Indians from the distant regions of the Argentine rivers, Rio Negro and Rio Colorado, are called *manzaneros*, or apple Indians. As a matter of fact, they and their kin in the provinces of Valdivia and Osorno live far more on the fruit of the apple tree than any European people, for it affords them both food and wine.

SPONTANEOUS IGNITION OF HYDROGEN.—Attention has recently been called to some peculiar cases of spontaneous ignition of hydrogen in air, the phenomenon having been noticed, it seems, in factories where quantities of zinc were being dissolved in hydrochloric acid for the preparation of zinc chloride. Violent explosions took place when no flame was near, and it was eventually ascertained that the gas took fire spontaneously. It is thought to be caused by fragments of very porous zinc, which, when lifted above the surface of the liquid, during the violent evolution of the gas, and so brought into contact with hydrogen and air, act just as spongy platinum would do under the circumstances. The performance of such operations in the open air is recommended. The ignition can be shown, according to M. Hoffman, by treating a few kilograms of finely divided zinc with acid; the zinc dust, he says, may even ignite by contact with water.

TO MAKE A STRONG PASTE.—To make a paste for fastening hills in a file hook, or for any purpose where a very strong paste is desired, the following recipe is recommended: Rice or starch paste is the best. Four parts, by weight, of fine glue are allowed to soften in 15 parts of cold water, and then moderately heated until the solution becomes quite clear; 65 parts of boiling water are now added with constant stirring. In another vessel 30 parts of starch paste are stirred up with 20 parts of cold water, so that a thin milky fluid is obtained without lumps. Into this the boiling glue solution is gradually stirred, and the whole kept at a boiling temperature for a short time. After cooling, a few drops of carboic acid are added to the paste. This paste is exceedingly adhesive, and may be used for leather as well as for paper and cardboard. It should be preserved in corked bottles to prevent evaporation, and in this way will keep good for years.

CHEAP GAS.—Much attention has of late been directed to some new processes for producing a cheap gas by the decomposition of water, which, in the form of steam, is brought in contact with incandescent carbon. The reports made by the scientific press state that the experiments in this direction in Sweden and Russia have been attended with good results, and various scientific authorities, some of them government officials, declare that the gas has been employed for welding wrought iron, for smelting in crucibles, both pig iron and steel—the effect being very satisfactory in respect to the heating power of the gas. For illumination, this kind of gas is claimed to possess some peculiar advantages. When used for this latter purpose, the gas is conducted through a vessel filled with cotton moistened with benzene.

ADHESIVE FOR RUBBER BELTS.—A simple adhesive for rubber belts is made by sticking powdered chalk, which has been evenly sprinkled over, to the surface of the belt by cold tallow or boiled linseed oil.

A PRESERVATIVE wrapping paper, adapted for apples, oranges or other fruit, may be prepared by dipping a soft tissue paper in a bath of salicylic acid and hanging it in the air to dry. The bath should consist of a strong alcoholic solution of salicylic acid diluted with all the water it will bear without precipitation. This preservative paper may be wrapped about the fruit before packing, and when the fruit arrives at its destination, the paper may be taken off and used for the same purpose again. A wrapping paper to protect furs, cloths, etc., from moth and mildew is prepared by dipping Manila paper in a prepared bath, squeezing it and drying it over hot rollers. This bath consists of a mixture of 70 parts of the oil removed by the distillation of coal-tar naphtha, 5 parts of crude carbolic acid, containing at least 50% of phenols, 20 parts of thin coal tar at 160° Fahr., and 5 parts of refined petroleum.

TO PRESERVE WOODEN VESSELS.—Wooden vessels, which, especially in chemical works, are quickly destroyed, should, according to Herr Schaal be well dried in hot air, and then painted twice or thrice with a solution of paraffine in six parts of petroleum ether. Vessels in which boiling is effected with steam should further be coated with linseed-oil varnish, or with water-glass; after drying the water-glass coating should be removed by means of dilute muriatic acid. Paraffine is also well adapted for packing stuffing boxes, especially in stirring apparatus exposed to vapors of fuming and English sulphuric acid.

TO REMOVE SUNBURN AND FRECKLES.—A safe and refreshing cosmetic may be prepared for the removal of tan, sunburn and freckles. Procure at a druggist a pint bottle, exact measure, and put in one ounce of pure tincture of benzoin and fill the bottle with distilled water. This should have a fragrant, aromatic odor, and assume the color and consistency of milk. After applying with a little velvet sponge the mixture must be left to dry on, especially at night after a day's exposure to wind and sun. If the skin happens to be very sensitive and a slight burning sensation follows, more water may be added.

AMMONIA IN VEGETABLES.—H. Pellet has lately found appreciable quantities of ammonia in various kinds of grain, as well as in beet root. In wheat the weight of ammonia is one-tenth as great as that of the ashes. He thinks that magnesia and phosphoric acid enter into vegetables under the form of an ammoniacal magnesium phosphate, which is very soluble in all vegetable acids. He is now studying the effects of ammoniacal manures, and of nitrogen, under different forms, upon the amount of ammonia in vegetables.

GOOD HEALTH.

Popular Fallacies.

It is not true that sugar and candies are of themselves injurious to the teeth or the health of those who use them; so far from it, they are less injurious than any of the ordinary forms of food when employed in moderation.

Any scientific dentist will tell you that the parts of the teeth most liable to decay are those which afford lodgment to particles of food; such particles being decomposed by moisture and heat, give out an acid which will corrode steel as well as teeth; but pure sugar and pure candies are wholly dissolved, there is no remnant to be decomposed to yield this destructive acid; we remember now no item of food which is so perfectly dissolved in the mouth as sugar and candy. When visiting the sugar plantations of Cuba the attention was constantly arrested by the apparently white and solid teeth of the negroes who superintend the process of cane grinding; they drank the cane juice like water, there was no restraint as to its use, and the little urchins playing about would chew the sugar-yielding cane by the hour. It is much the same in Louisiana, where the shining faces and broad grins of the blacks are equally indicative of exuberant health and "splendid teeth."

How does it happen then that there should be "the prevalent belief" that sugar and sugar-candy destroy the teeth and undermine the health? Perhaps the most correct reply is *tradition*, the father of a progeny of errors in theory and practice; of errors in doctrine and example, "too tedious to mention."

One of the common faults of the times is an indisposition to investigate on the part of the masses. We take too much for granted. A very common answer to a demand for a reason for a time honored custom is, "Why, I have heard it all my life. Don't everybody say so?"

It would be a strange contradiction in the nature of things if sugar and candy in moderation should be hurtful to the human body in any way, for sugar is a constituent of every article of food we can name, there is not a vegetable out of which it cannot be made, not a ripe fruit in our orchards which does not yield it in large proportions, and it is the main constituent of that "milk" which is provided for the young of animals and men all over the world. Perhaps the child has never lived which did not love sweet things beyond all others; it is an instinct, a passion not less universal than the love of water. A very little child can be hired to do for a hit of sugar what nothing else would. The reason of this is, that without sugar no child

could possibly live, it would freeze to death; it is the sugar in its food which keeps it warm, and warmth is the first necessity for a child.

But to use this information intelligently and profitably, it must be remembered that sugar is an artificial product, is a concentration, and that, if used in much larger proportions than would be found in our ordinary food, as provided by the beneficent Father of us all, we will suffer injury. We should never forget that the immoderate use of anything is destructive to human health and life if persevered in. The best general rules to be observed are two:

1st. Use concentrated sweets at meal times only. 2d. Use them occasionally and in moderation.—*Hall's Journal of Health.*

AURAL DISTURBANCES FROM BATHING.—The frequency of attacks of aural inflammation from bathing demands more than a mere mention, for complete deafness may result from the injuries to the ear from this cause, and partial impairment is frequent. These injuries from bathing are mainly due to the fact that man is not afforded the protection to the ear that amphibious animals possess, and hence the water may act injuriously in various ways. In surf bathing the mere force of contact, when the water flows into the ear, may injure the tympanic membrane, and when an incoming wave dashes against the face, water may freely enter the mouth or nose, and thus be driven into the ears through the eustachian tubes. The presence of cold water for a long time in the canal leading to the ear, as when much diving is done, may set up much inflammation in the canal or in the tympanic membrane, which may extend to the drum cavity itself. If effects may be produced by allowing the ears, head and body to dry in a current of air after coming out of the water. Sea water is probably more obnoxious than fresh, on account of its comparatively low temperature and the large quantity of salt it holds in solution. A long continuance in the water should be avoided. The Russian bath should not be taken without protecting the ears when the cold plunge is used. Diving is, however, the most dangerous practice connected with bathing, for it is difficult to keep water from entering the ears, or nose or mouth. In diving, the pressure of water on the tympanic membrane from without may cause vertigo. Even syringing the ears gently is known in some instances to occasion decided dizziness.—*Harper's Magazine.*

EATING FOR HEALTH.—One of the most prolific causes of disease is improper eating, or taking food when the stomach is not prepared to digest it. If food is taken at the proper time, and in not too great a quantity, and is composed of perfect cell structure, the stomach will faithfully perform its duties, and the process of assimilation will build up the system with healthy material. But if food fails to digest, the heat of the stomach soon rots it. A portion of this putrid matter is absorbed by the lacteals, taken up by the circulation, and deposited in various portions of the system to rebuild torn down tissue. Can such a condition of the human organism be an index to perfect health? Yet such states exist. People often eat, sometimes heartily—not because they are hungry, but because it is meal-time; and unwittingly violate a hygienic law which will result, if continued, in impaired health with all its concomitant evils. Many children are fed to death by kind, indulgent mothers—actually crammed with pastry, candy and nuts until their entire system is diseased, a mass of putrescence made from decayed vegetable and animal matter. We need not say anything of the evil effects of stimulants and excitants. The thousands of slaves to this form of dissipation, the dreary homes, ruined constitutions, and physical racks speak more forcibly than words of the baneful effects of unnatural stimulation. Drinking and eating, in short, cause more ills than any other two things in the world. And until people learn to govern their appetites these causes will breed disease and misery.

MORNING WALKS NOT HEALTHFUL.—It is a great mistake, says a medical writer, to suppose that a morning walk or other form of exercise before breakfast is healthful; the malaria which rests on the earth about sunrise in summer, when taken into the lungs and stomach, which are equally debilitated with other portions of the body from long fast since supper, is very readily absorbed and enters the circulation within an hour or two, poisoning the blood, and laying the foundation for troublesome diseases; while in winter the same debilitated condition of these vital organs readily allows the blood to be chilled and thus renders the system susceptible of taking cold, with all its varied and too often disastrous results. Some will say, look how healthy the farmer's boy is, and the daily laborers, who go to their work from one year's end to another by "crack of dawn!" My reply is, if they are healthy, they are so in spite of these exposures; their simple fare, their regular lives and their out-door industry, give their bodies a tone, a vigor, a capability of resisting disease, which nullifies the action of malaria to a very considerable extent.

ONE CAUSE OF INSANITY.—At a recent meeting of German doctors interested in the treatment of insane persons, a paper was read by the director of the Brunswick State Lunatic Asylum, in which he maintained that much of the increase of insanity in Germany is attributable to the excessive amount of work imposed upon the pupils in the national schools.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Huntington Oscillating Stamp; Mazourka Canyon Smelting Ores; Curiosities; Smoking in Mines, 241. The Week; Miners' Permanent Relief Fund; Locations or Mines; Oakland Harbor; Result of the Imperial Accident; More Stamps than Ore, 243. Practical and Theoretical Mining; A Curious Animal from South Africa; A German Patent Exhibition; Notices of Recent Patents, 249.

ILLUSTRATIONS.—The Huntington Oscillating Quartz Mill, 241. Destructive Locusts on the Pacific Coast, 249. The Moholi (Galago Moholi) from South Africa, 249.

CORRESPONDENCE.—Columbia Mining District, Nevada—No. 2, 242.

MECHANICAL PROGRESS.—Welding by Pressure; A New Screw; Puddling of Iron; Size of Governor Pulleys; A Remarkable Casting; Hot Polished Shafting; Difficult Casting; Rendering Iron Fire Proof; Should Sand be Used in Welding?; Notes on Steel, 243.

SCIENTIFIC PROGRESS.—Gould's Comet; Malleable Nickel; The New Photophone; The Course of a Lightning Flash; Salt Lake in Ancient Times; A New Shade for Electric Lights; Phosphorescent Lighting, 243.

MINING SUMMARY from the various counties of California, Nevada, Montana, Arizona, Utah, Idaho, and Colorado, 244-45.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 244.

USEFUL INFORMATION.—Paper Barrels for Oil; Natural Spread of the Apple Tree in South America; Spontaneous Ignition of Hydrogen; To Make a Strong Paste; Cheap Gas; Adhesive for Rubber Belts; To Preserve Wooden Vessels; To Remove Sunburn and Freckles; Ammonia in Vegetables, 247.

GOOD HEALTH.—Popular Fallacies; Aural Disturbances from Bathing; Eating for Health; Morning Walks not Healthful; One Cause of Insanity, 247.

NEWS IN BRIEF. on page 252 and other pages.

MISCELLANEOUS.—Northern Emeralds; Belmont and Adjoining Districts, 242. Grasshoppers Upon the Pacific Coast, 246. Plumas County Mining Interests, 247. Bechtel New Works, 250. The Kuox & Osborne Mine, 252.

Business Announcements.

The Week.

The excitement of the political campaign increase as the day of election draws near, and even the somewhat exclusive pursuit of money making is for the time overlooked. Many of our exchanges team with political news and opinions to the exclusion of local topics. From the mining districts generally, however, the news is good. Preparations are now being made for winter in most of the camps. Ditches are being repaired, machinery overhauled, wood laid in, and arrangements made to save trouble during the winter months.

In these regions the week has been characterized by beautiful weather, clear, sunny days and fine, cool nights. Although in daily expectation of rain, there are no indications of it at present writing. The hydraulic miners are all prepared for the rain when it does come, and anticipate a first-class season this year.

HOWLAND FLAT.—The *Mountain Messenger* says that this is the liveliest mining camp, excepting Forest City, at present in Sierra. All the drift and hydraulic mines are panning out a generous supply of gold, in such large quantities that the lucky owners of quite a number have succeeded in bonding their property for hundreds of thousands of dollars, on but a few months' time, when the probability is they will sell out to Eastern capitalists, whose intention is, in connection with others, to develop the vast comparatively unexplored rich gravel fields of the north on a grander scale than ever attempted heretofore in all the checkered career of our intrepid and adventurous wielders of the pick and shovel, since the inauguration of the industry of mining in the vast mineral belts of the Sierra Nevada.

But little river mining has been done around Coloma this season, except by Chinamen, owing to the high stage of water.

Miners' Permanent Relief Fund.

In some portions of England what are known as Miners' Relief Funds have been established, and have proved very advantageous. The plan is for the men to pay weekly out of their wages a sum which shall form a fund for the support of the families of those killed by accidents in mines. The idea is an excellent one, and could be followed with benefit in this country.

There is no reason why the relatives of those persons killed in mines should have to depend on public generosity. Public charity need not be evoked every time there is a great calamity. The men, when in employment, by the payment of a small weekly sum, can ensure their families against want, in the event of their meeting with accident, and to do this is no more than a duty. The value of the Miners' Relief Funds in the case of a calamity involving heavy loss of life, has been most forcibly shown in connection with the Seabam colliery explosion. Of this, the *London Mining Journal* says: "Unlike the miners in South Wales (where colliery explosions have been most frequent and fatal), who refused to subscribe toward a fund for the support of the families of those killed by accidents in mines, those in Durham for years past have been cheerfully paying a sum weekly to maintain those connected with them in case of death. The result has been that when the explosion took place at Seabam there was a sum of no less than £30,000 to meet the claims of the widows and children, so that in one day more than £1,000 were paid to the sufferers. There was no necessity for an appeal to the public to relieve the immediate wants of those who had been bereft of their breadwinners. Charity was in no way invoked; the provident habits of those who were killed were sufficient after death to ensure ample provision for those they left behind them. In the history of our mining operatives and mining fatalities on no previous occasion has there been recorded the interesting fact that relief for all the sufferers had been provided before the sad occurrence took place. Nine years ago at the same colliery an explosion took place, killing 26 men, half of whom belonged to the permanent relief fund, while the other half were outside of it. A public fund was raised, and the same, we are told, has been administered unequally, and ever since there has been general dissatisfaction in the neighborhood. On the occasion of the recent explosion all the men are in the society, and the relatives of all are to be treated alike."

Locations or Mines.

A mining location is not a mine by any means, though many persons think it is. The people who do are those who first come into a mining camp and those who buy stock in any company which is advertised, without knowing anything about it.

The new comer in a new camp is apt to think a staked out claim is a mine, the same as he thinks a six-foot hole in the ground is a shaft. He thinks his mine is as good as anybody's and perhaps better than an old one, since there has not been so much taken out. He is apt to ask a figure nearer \$50,000 than \$5 for each a claim, especially after he has blasted and dug away at it for a few months.

Calling a location a mine, however, don't by any means make it one unless it is to be "put upon the market." In that case, one is as good as another very frequently, for paper certificates are the basis rather than ore deposits in many of the new companies. It sometimes happens, and pretty often, too, that these holes in the ground are sold as mines to people who don't know any better, and they therefore have a commercial value after all.

It takes a long time for a community to learn the difference between locations and mines, and it is a question it is not always safe to leave even to "experts." They sometimes mistake the one for the other, a mistake some one else usually has to pay for.

HYDRAULIC MINING.—The hydraulic miners are now all busy getting ready for the winter season. Dams have to be tightened and put in order, ditches repaired, strengthened and cleaned, blocks have to be cut and laid away ready for the boxes, so as to save interruption in work. Wood must be laid in, and a hundred and one other things prepared for the rainy season. From many points of the hydraulic mining region come reports of anticipation of a busy and prosperous season. This year has been a good one for the miners, and the coming one is expected to be good also. Water everywhere is now at its lowest stage, so it is a favorable time to prepare for the rain. The provident miner is ready for it when it comes, so as not to lose a drop of the precious fluid.

It is reported that Mr. Hale paid for a controlling interest in the Robertson reduction company somewhere between \$250,000 and \$500,000.

Five mines paid \$136,250 in dividends at New York in September, and one paid \$50,000.

Oakland Harbor.

Work is now to be vigorously prosecuted on the improvement of Oakland harbor. The contract for finishing the training walls has been let to Dennis Jordan for \$80,000, the work to begin by October 25th, and to be done at the rate of 8,000 tons of rock per month on the walls, which are to be riprapped. From 4 to 6 ft. of stone-work is necessary to put on the top of the walls, as they now are, to bring them above high-water mark. About 75,000 tons of rock will be utilized in this work, and it is to be prosecuted to a speedy completion. From 8 to 12 schooners, each carrying from 80 to 120 tons of rock, will be used in the work, carrying the rock from Point San Pedro to the harbor. No dredging will be done until the walls are finished.

It may be that during the winter months barges and tugs will be employed instead of sailing schooners, for carrying the rock, especially as it must be transported some distance. In the other contracts on these walls the rock was brought from Goat or Angel island, part being from each. These are both Government quarries, however. This time the rock is to come from a private quarry of Mr. McNear's at Pedro point, near the Sisters islands, northeast of San Rafael. At this point there is an excellent quarry and the rock can be readily handled from it.

The walls, as they now are, have been very much flattened down since work was stopped on them. In taking the slope brought about by the action by the water on the rocks, the center line of the walls has been thrown to one side 15 or 16 ft.; that is, in some parts, the sea has pounded and flattened the wall so that its center line has been moved to one side of its original position.

The delay in the work has no doubt done as much good as harm. The walls have settled down permanently, and there is now a good foundation for the work. It is expected that the channel will deepen when the walls have been carried above high water, and if it does not, dredging will be done so as to give a uniform depth. The channel between the ends of the walls and the shore has not shoaled, but above the bridges, the creek and basins have materially shoaled of late.

Results of the Imperial Accident.

A short time since we chronicled a disastrous accident in the Con. Imperial mine in the Comstock, by which a number of men were killed. A number of experts testified that the cable was rotten and not fit for use for the purpose for which it was applied. The Coroner's jury charged the company with criminal carelessness. Now, Henry Ryder, administrator of the estate of Richard J. Ryder, deceased, has commenced action against the Con. Imperial M. Co. for \$25,000 damages. The plaintiff is brother to the deceased, who was one of the victims of the late accident at the Con. Imperial. The complaint alleges carelessness on the part of the employees of the mine, and the use of a rotten, imperfect and unsafe cable, causing the accident by which deceased lost his life.

Messrs. Lindsay & Dickson are plaintiff's attorneys, and during an interview with a *Gold Hill News* reporter, Mr. Lindsay said he had two or more suits to bring against the Con. Imperial on account of the same accident, and had been consulted in still other cases which would be put into his hands. He thought Lewis & Deal and Woodburn and Tuska had similar cases, but they did not know how many, in all were likely to be brought. He said, moreover, that the company refused all offers to compromise, and told the plaintiffs to go ahead with the suits. The officers of the defendant refused to offer anything whatever to settle the matter.

NITRO-GLYCERINE POWDERS.—A very important case has been on trial for some time in the U. S. Circuit Court in this city, entitled the *Giant Powder Co. vs. the California Vigorite Co.* Mr. Justice Field delivered judgment in favor of the defendants. The suit was brought for the alleged infringement of a re-issue of Nobel's patent for rendering nitro-glycerine safe for use, storage and transportation. The original patent covers a compound of nitro-glycerine and any inexplosive, porous absorbent which will take up the nitro-glycerine and render it safe for transportation, use or storage without destroying its explosive power. The re-issued patent, dated March 17th, 1874, enlarges the scope of the invention so as to embrace a compound of nitro-glycerine with any porous substance, explosive or inexplosive. Mr. Justice Field held that a patent could be re-issued only for the purpose of correcting mistakes, and not for purposes of enlargement, and that, consequently, the re-issued patent is invalid. This suit was instituted about a year ago and has been considered a very important one. The decision is supposed to dispose also of the pending suit of the *Giant Powder Co. vs. the Vulcan Powder Co.*, the same question arising in both. The decision, which is quite voluminous,

More Stamps than Ore.

One of the commonest of mistakes new mining companies make is that of putting up mills before the mines are properly developed. An other mistake which is becoming common, is to build mills of a capacity far beyond the needs of the mine. It seems big to say "a new 40-stamp is being built," or "20 stamps will be added to the mill to keep crushing facilities up with the ore production." These things help to sell stock, but they don't do any good to the mine in the end. In fact, such things usually react.

A case in point recently occurred in Amador county at the Monterichard mine. The mine was sold some time since, and lately it has been reported that the mill and mine would be shut down. The *Ledger*, while denying this, says it will be kept running for some little time at least. It says further: "The truth is, the mine was sold for a good round sum on the strength of grossly false representations. The ledge is very narrow, of fair quality what there is of it. There never were any developments to justify the putting in of the 10 additional stamps, and the quantity of rock now being extracted is nothing like sufficient to keep the mill running to its full capacity. A four or five ft. ledge of the same quality ore would make a paying mine, but instead of this the ore-body rarely reaches two ft. in width. The superintendent has been encouraged the last few days by the ledge showing 18 inches of good-paying rock, but while this is encouraging, it does not warrant any sanguine expectations of the future of the mine."

MINERAL LANDS.—A case is now being tried in the Supreme Court of the United States, which is regarded as a test case, which is of importance to many people in the State, and in which B. F. Butler has been retained to represent the interests of California vs. the United States, George A. Nourse being the attorney for the Government. The case is to determine the ownership of the minerals on the 16th and 36th sections of land in the townships of all lands granted by the United States Government to the State of California in 1854. It seems that Amador City is situated on the 36th section of one of these townships and the Keystone mine owned by the Pacific Bank in this city, and worth three or four millions of dollars, is located in that town. The mining company claims not only the gravel deposit, but the lode also, relying on its purchase from the State of California. On the part of the United States, it is claimed that the lode and mineral of all kinds was reserved to the Government, and that by the terms of the grant the United States never parted with its title to the minerals which might be under the ground. In other words, only the surface of the soil was granted. The case was tried here before Judge Sawyer, who decided adversely to the State of California, and an appeal was taken to the United States Supreme Court. When Gen. Butler was first here he was employed by the State to prosecute the appeal, and Mr. Nourse is now in Washington city to act for the United States. The town of Bodie is also located on one of these sections, and the decision of the Supreme Court will be anxiously looked for.

MINING CAMPS IN WINTER.—Now that winter is almost upon us, the army of prospectors which has been scattered over the mountains during the past 6 months will begin to gather in the camps. At the same time the camps themselves are dull in the winter as a general thing, and want less, instead of more people. In many of the mining towns of this coast comparatively little work is done in the winter, and consequently fewer hands are employed. This of course brings hardships upon the unemployed. Those who can afford it prefer to live in the larger places during the winter, but the working miner cannot always choose his abiding place to suit himself. Concerning the prospect in the Comstock, the *Virginia Enterprise* says: As the grass is liable to be very short here this winter, quite a crowd of miners will probably leave the Comstock for various mining camps in Montana immediately after the Presidential election. All young and unmarried men who can get away should strike out, and give men who are tied here with families a chance to make a living; otherwise much destitution will be seen in the city before next spring. It is always easy enough for young men to get back here in case of the striking of a bonanza and a demand for miners. Just now the demand is in Montana.

DOS CABEZAS DISTRICT. distant 11 miles from Wilcox station, S. P. R. R., is attracting quite a rush of mining men on account of its recent developments. The ledges are not only numerous, but rich. Quite a settlement has sprung up in that district within the last month.

THE CENTRAL CITY gold district, of Colorado, keeps 17 quartz mills, besides partially supplying many extensive smelters. Over 600 stamps are now at work, crushing 450 tons of ore daily.

Practical and Theoretical Mining.

Every one will admit that even a modicum of scientific knowledge will do a practical miner no harm even if it does him no good; and that attendance at mining lectures cannot but benefit in some degree the practical man who attends them. Still there are men who will sneer at what they call book knowledge, and think "practice" is the only thing of any value. Lecturers on mining never intend that their discourses should be all that a student needs who intends to make mining his profession; they intend that their lectures should be supplemented by practice. It is clear that the necessary practice can easily be obtained in mining schools situated in mining districts, and in such districts, practical mining usually, if not universally, forms part of the curriculum. At the mining school at our University of California, lectures are given on mineralogy which teach the student to know the minerals when he sees them; and lectures are given on metallurgy, which teach him how ores of different classes are worked. It is not pretended, however, that this instruction alone will fit a man to take charge of a mine.

In answer to some objections to what is styled theoretical teaching Mr. E. Halse writes to the *London Mining Journal* a letter in which he makes the following sensible remarks:

The Royal School of Mines, being situated in London, cannot teach its students practical mining without very greatly increasing the cost of training; they must obtain that knowledge during the vacation, or after they have gained their diplomas. The school does all it can by thoroughly grinding the students in all the sciences in which mining proper is built, by providing a most able lecturer on the subject, and by exhibiting numerous minerals from all parts of the inhabited globe, and many models of mines and mining machinery. When the student leaves the school he has attained such a thorough grasp of the principles of mining, and of the details of the machinery connected therewith, that a fair proportion of practical knowledge makes him competent to manage any mines in the world. He has no local prejudices, nor—worst of all—the prejudice of ignorance. It is not necessary for him to grope all his life "in the bowels of the earth." If he is not the dullest of mortals, he will soon acquire the use of the pick. Enthusiasm and patience are his best teachers in the use of this tool. After a time—I speak from practical experience—he will be able to feel, as it were, the hardness of different kinds of rock, and know at once from its use the cost per fathom of driving such rock. If he is in the smallest degree an observer, by studying the changes of a lode from day to day, he will learn more of the real nature of lodes in a couple of years than most practical miners learn in a lifetime. The knowledge of the proper use of the dial will enable him to avoid some of the atrocious blunders into which some practical miners steer.

Mining has suffered little if at all from mining students, who, as a rule, take a pride in their profession, and who endeavor all they can to raise its tone; but mining has suffered terribly from ignorant, bigoted and unprincipled men who are pleased to call themselves "practical," and whose chief occupation is telling lies and pocketing fees. Such men may form but a small section of practical miners, as I trust they do, but they are, nevertheless, a very powerful section for evil, and have done more to debase mines and mining than the blunders of a million directors. But there are many men, essentially practical, who can "look the whole world in the face," for they are honest and straightforward. It is a pleasure to know such men, for they are ever eager to learn the sciences that lie at the root of mining, and are quite as ready to impart their practical experience, which is often very great, to others. But if men, who, though honest, no doubt, and otherwise estimable, close their eyes to any and every kind of knowledge that is gained by books and oral teaching it will soon be said, "Otello's occupation 's gone!"

UNASSESABLE MINING STOCK.—The practice of issuing unassessable stock, that is in vogue with Eastern mining companies, is by no means calculated to advance the interests of honest enterprises. Often the best of new prospects are compelled to shut down at the very time that they give promise of developing into self-sustaining mines, for the simple reason that the original working fund is exhausted, and a small minority of the parties interested, who know nothing about mining, cannot be made to see why their claim has not made from the grass-roots. There have been three notable illustrations of this state of affairs in Nevada county within a few months past. Eastern capital is a good enough thing to have come in here, but when it is hemmed about by the narrow-minded laws that govern Eastern incorporations, it frequently proves a detriment to the district by being lost to the investors, who draw out of the light before they are fairly in it.—*Nevada Transcript*.

THE CINCINNATI INDUSTRIAL, fair was a financial success.

A Curious Animal from South Africa.

Our engraving shows the Moholi (*Galago moholi*), an inhabitant of South Africa first seen by the explorer, Dr. Smith, hopping about the branches of the trees that bordered the Limpopo river, in 25° south latitude. The moholi galigo is nearly 16 inches in length, inclusive of the tail. Its color is gray, with irregular markings of a deeper hue. The under parts of the body are nearly white, and the limbs are slightly tinged with a golden luster. The tail is not very bushy, excepting at the extremity, and its color is a chestnut brown. The texture of the fur is very soft, and there is a slight wooliness in its setting.

Nocturnal in habits, it sleeps during the day, with its large ears folded over the head in such a manner as to give it the aspect of an earless animal. The moholi does not secure its prey by stealing on it with slow and silent movements, but leaps upon the flying insects on which it loves to feed, and seizes them in its slender paws. Besides insects, various fruits form part of the moholi's food, more especially such as are of a pulpy nature, and it is said that the moholi eats that vegetable exudation which is known by the name of gum senegal. Its diurnal repose is taken in the curious nest which it builds in the forked branches of trees, using grasses, leaves and other soft substances for the purpose. In this lofty cradle the young are nurtured until they are of an age to provide for themselves.

The face is full of expression, in which it is aided by the large and prominent ears; and the creature is said to contract its countenance into

THE MOHOLI (*Galago moholi*) FROM SOUTH AFRICA.

strange grimaces, after the fashion of the ordinary monkeys. Like the monkeys, too, it can leap for some little distance, and spring from one branch to another, or from tree to tree, with agility and precision.

A DISCHARGED MINER KILLS A SHIFT BOSS.—Michael Carbis, shift boss in the California mine, at Silver Reef, Utah, was stabbed Sunday morning, the 3d inst., by Thomas Forrest. Forrest had been discharged from the mine by Carbis, who had been ordered to do so by the foreman, Johnson Vivian. Mr. Carbis was just above the Buckeye mine, on his way to the California, when Forrest, who had evidently been lying in wait for him, rushed upon Carbis and stabbed him in the left side, inflicting a mortal wound, and he died at 5 o'clock that evening. An eye witness to the assault immediately came to Silver Reef and reported it to Deputy Sheriff Hoag, who at once started out with a detachment in pursuit of Forrest. By the aid of Indians, Forrest was tracked to the Tecumseh Tunnel, where he was arrested and lodged in jail, and on Monday he was taken down to St. George and placed in jail there. Tuesday night Forrest was taken from jail, and it is supposed by citizens from Silver Reef, and hung to a tree. Forrest was employed in Pioche in 1871 as a "fighter." Michael Carbis was a respected citizen of Silver Reef, and had lived for several years in Pioche. He is an old pioneer of this coast, having resided for a long time at Grass Valley, California.

NATIVE PORCUPINE.—Josiah Pool, of Isleton, informs us that near Woodworth's wharf, on Andrus island, some dogs were recently discovered hating, with doubtful result, with what was supposed to be an enormous ooon. To assist the dogs the animal was dispatched with an ax, and afterwards discovered to be a genuine porcupine, quills and all. Question—Where did it come from?

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ELECTRICAL RECORDING TARGET.—Richard H. Savage, Empire Foundry, San Francisco Patented Sept. 21, 1880. No. 232,417. This invention relates to a self-recording target and indicator for small-arm practice, which is also useful for testing guns, cartridges and powder for penetration, as well as accuracy of aim, as well as to record time of flight of projectiles. It consists of a target which is subdivided into a number of areas, each of which is properly supported and guided, and is free to move backward upon the impact of a shot and be returned to its place by the action of elastic buffers, springs or hinges, in combination with certain details of construction. It also consists in a combination of wires, sectional target, a timing device, and the weapon being fired, whereby the velocity of the shot is measured.

BREECH-LOADING FIRE ARM.—Charles Slotterbeck, Lakeport, Cal. Patented October 5, 1880. No. 233,034. This device relates to certain improvements in breech-loading guns of that class in which the barrel is hinged to the fore end of the stock, so that when unlocked it tilts in a vertical plane. It is especially adapted to be used for a single-barreled, breech-loading rifle, in which great solidity of action is necessary to prevent derangement in the accuracy of its shooting. It consists in an improved construction of the fore-end joint, by which a

A German Patent Exhibition.

A "general German patent and registered articles exhibition" will be held at Frankfurt on-the-Main from the 1st of May to the 30th of September. For the first time will the opportunity be given of subjecting the patents obtained in the German empire to general judgment, and of proving publicly the value of the inventions and improvements made. The promoters think that by means of this exhibition large amounts of capital can be obtained by the inventor or owner of patents. Up to the present time the co-operator, without whom the practical development of an invention cannot be effected, has often been searched for in vain in the money market.

The main object of the exhibition is to bring to public notice the greatest novelties in the domain of inventions and designs. It is intended to afford the inventors an opportunity for bringing forward their inventions, and the public an opportunity of judging them from personal inspection. The inventors are to be thereby afforded the possibility of more remuneratively disposing of their productions, and the capitalist will be induced to combine with the inventor for their mutual co-operation and benefit. The German nation, on the other hand, will be thereby encouraged to bring its inventive faculty more into action and public notice than heretofore, and to compete with other nations in the production of new things and in supporting important undertakings.

It is therefore intended in the first place to exhibit such objects as are prepared (a) on the basis of German patents, whether old or new, expired or in force, or only applied for at the German Patent Office, without reference to whether the objects have been prepared in Germany or abroad. (b) On the basis of important inventions for which it is not intended to obtain patents; but only in so far as these objects are manufactured in the German Empire. (c) On the basis of the design laws of the German Empire, and legally protected there whether the objects be made in Germany or abroad.

Only "those things will be admitted which are produced by a German patent, actually made in the German Empire, or manufactured under German design laws. A stated price is charged exhibitors for space, power, etc.

This is a good opportunity for American inventors, who have German patents, or who intend applying for them, to exhibit their articles. We have at this office copies of the circulars issued to inventors, which may be seen by those desirous of examining them.

A SELF-EXTINGUISHING SAFETY LAMP.—In an improved mining lamp lately invented in England, the clock instead of being an ordinary screw as used in the present lamp, is a beveled steel bolt fitted vertically into the reservoir of the lamp, and projecting through the top is kept in position by a steel spiral spring contained in a tin cylinder fixed inside the reservoir of the lamp. A steel stud is screwed in the side of the outer case, and projects about 3/16ths of an inch inside the lamp, passing a bolt on the beveled side when screwing up the lamp, and consequently locking itself. To open the lamp it is necessary to release the rod from the loop at the bottom of the lamp, and draw it downwards until the lower edge of the extinguisher comes in contact with the top part of the bolt, and which will bring the under side of the top of the extinguisher about 1/2 inch above the burner tube; by continuing to draw the extinguisher down, it puts out any light that may be in the lamp, and at the same time allows the stud to pass the bolt on the top of its beveled part, when the lamp can be unscrewed in the ordinary manner. When the pressure is taken off, the bolt resumes its original position by means of a spiral spring. The extinguisher is made with corrugations at the side and a number of small holes at the top to allow the flame to escape above it, preventing the possibility of the flame escaping through the gauze by the too quick drawing down of the extinguisher.

SILVER PEAK AND LIDA.—Parties who have recently returned from Silver Peak and Lida Valley, and the country in that section, report the mini outlook very favorable. Everywhere that any work is being done the mines show well. The entire range is one mass of mineral, and wherever prospecting has been pursued to any definite extent the showing has been more than satisfactory. When the country becomes more closely connected with the balance of the world by rail and other communication, it is certain to make itself felt in mining circles.—*True Fissure*.

DITCH WORK.—The South Yuba water company will commence on the 5th of next month to enlarge and clean their ditches extending from the South Yuba river to Blue Tent, which is about 30 miles in length. About 100 men will be employed for such purpose, and the work will probably be finished in about a month. The reason why the South Yuba company intends to enlarge the said line of ditch is in order to afford the Blue Tent Gravel mining company a larger supply of water which will be an increase of 1,000 inches.—*Nevada Herald*.

LICENSE COLLECTOR SINTON on Tuesday forwarded to the State Treasurer, by Wells, Fargo & Co., \$3,920.60 on account of the State Mining Bureau.

THE Tombstone mill and mining company of Arizona have declared their seventh dividend of 10 cents per share, payable at Philadelphia on the 15th of October.

BUENOS AYRES has been declared by the Senate to be the capital of the Argentine Republic.

Bechtel New Works.

A *Standard-News* reporter strolled into the new shaft house of the Bechtel mine late yesterday afternoon to see the new machinery at work, and to his astonishment found the new works the most complete and substantial on the lead. The new machinery consists of a double engine of 12 by 14 inch cylinders, recently manufactured by Prescott, Scott & Co., of San Francisco, a Corliss valve to feed the cylinders, and a No. 2 Cameron pump to feed the boiler. The boiler is 16 ft. by 50 inches, and is enclosed in brickwork substantially braced and bolted by heavy iron bars. The engines, reels, etc., rest upon a Corliss cast-iron bed, securely bolted to a granite foundation. The engines have ample

Capacity for Sinking 1,500 ft.

The crank shaft is five inches and the reel shaft eight inches in diameter. The spur wheel is 10 ft. in diameter, and has a 12 inch face and three inch pitch—between cogs. Compound brakes of the most substantial character give perfect safety, and the reels can be stopped instantaneously by pressing the foot upon the brake-bar where the engineer stands. There are two large reels, one on each side of the spur-wheel, but at present but one of them is in use. Each reel has 1,500 ft. of new wire cable of the best manufacture, the cable being four and a half inches wide and five-eighths of an inch thick. The gallow's frame is also of the most substantial character, and in fact, every thing about the new shaft works as smoothly and almost as noiselessly as a sewing machine. The fine

Double-compartment Shaft.

Is now down 119 ft. below the 400 level, and being sunk with remarkable rapidity. The shaft is being substantially timbered as sunk, and the new safety cage, which runs as smooth as a skate on ice, is provided with long iron shoes, which extend up the guides far enough above the cage to permit of the latter being lowered to the bottom of the shaft the full length of two sets of timbers below the timbers and guides. Thus the cage with a car goes to the bottom where the men are sinking, 10 ft. below their guides, the car is loaded and hoisted with as little jar, and as little danger, as if the guides extended to the bottom. This arrangement greatly facilitates sinking. The building over the new works is a most substantial and capacious one, affording room for a carpenter shop, blacksmith and machine shop. The latter has not yet been provided, if we except a fine drill press, which is already in place and is to be run by steam; but it is understood that a lathe and other necessary machinery will soon be added.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also

**SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 300 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.

Suicides gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.
This work is unequalled by any other published, embracing
the subjects treated. Its authority is highly esteemed
and regarded by its readers, containing, as it does, much
essential information to the Miner, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly reudered together and in simple or-
der. It contains 120 diagrams, illustrating machinery
etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without
Quicksilver. 1880.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed full
of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country and in
Europe, and explains the why and wherefore.

It contains 155 pages, embracing illustrations of furnaces,
implements and working apparatus.
It is a work of great merit, by an author whose reputation
is unsurpassed in his specialty.
Price, \$3.00, cloth, postage free.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), In-
cluding the Chlorination Process for gold-bearing sulphurets,
arsenurets, and gold and silver ores generally, with 120 litho-
graphic diagrams. 1867. This work is unequalled by any
other published embracing the subjects treated. Post-paid,
\$7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES. - Illus-
trated, 114 pages. 1876. A useful and practical work, free

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!

History, Development and Action; Classification and Com-
parison; Manufacture, Care and Use of SAWS of all
kinds. Quarto. 234 Illustrations.

By **ROBERT GRIMSHAW, Ph. D., M. E.,**

Member of the Jury on Wood-working Machinery at Paris
Exposition of 1878.

This thorough work, impartially written in a clear, simple
and practical style, treats the Saw scientifically, analyzing
its action and work, and describing, under the leading classes
of Reciprocating and Continuous Acting Saws, the various
kinds of large and small hand, cash, Mulay, jig, drag, cir-
cular, cylinder and band Saws, as now and formerly used for
crosscutting, ripping, scroll-cutting, and all other sawing
operations in wood, stone and metal, ice, ivory, etc. In this
country and abroad. With appendices concerning the details
of manufacture, setting, swaging, gumming, filing, etc., tables
of gauges, log measurements from 10 to 24 feet, and from 12
to 36 inches, lists of all U. S. Patents on Saws from 1790 to
1880, and other valuable information. Elegantly printed on
extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and
illustrations since first projected, the price is this date made
\$2.50, postage paid.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia
March 10 1880.

A Card from Architects.

The California Architect and
Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from
prominent Architect in this city:

Believing that a journal of this kind is a necessity on this
coast, and judging from what has appeared in the "Quarter-
ly Architectural Review," we are led to believe that the
CALIFORNIA ARCHITECT AND BUILDING REVIEW
will be worthy of generous support and encouragement. We
therefore pledge our cordial sympathies, personally, and hope
that the enterprise will receive a kindly recognition and liberal
support from all Architects and Builders and the public gen-
erally. (Signed) David Farquharson, Wright & Saunders, S.

The Knox & Osborn Mine.

The Knox & Osborn mine (formerly known as the Boston) is situated in Buckeye gulch, about 2½ miles from Mokelumne Hill. It is worked from two tunnels known as the east and west tunnels respectively; they both commence from the head of Buckeye gulch and follow the vein with the mountain. The east tunnel is now in 100 ft. following the east wall. The face of this tunnel is in low grade ore which will mill from \$3 to \$5 per ton in gold. The west tunnel follows the foot wall, is in 220 ft., and has passed through fair grade milling ore from the start, that is, ore that is thought to contain from \$6 to \$10 per ton in free gold, and the concentrations from \$2.50 to \$3 more. A crosscut from the west tunnel to the hanging wall has been run, showing the ledge to be 60 ft. wide from wall to wall, and it is safe to say that the entire body of quartz between the walls will pay by milling process from \$6 to \$8 per ton, possibly not over \$4. Two-thirds of the gold is free and consequently can be saved on copper plates. The crosscut is run from a point 110 ft. from the mouth of the tunnel, where also an air shaft has been raised to the surface on the footwall 125 ft. and pay quartz found clear to the grass roots. At the top of this air chute or shaft the third tunnel or adit level has been started on the course of the vein, and is also in a corresponding grade of quartz to that of the west footwall tunnel. This third or upper tunnel is in about 25 ft. The first two tunnels have car tracks in them. The east tunnel being some 25 ft. lower than the west tunnel, it is an easy matter to keep the mine well ventilated by a series of crosscuts.

In addition to the mine developments, the Knox & Osborn Mining Co. have commenced and nearly completed a 20-stamp water-power quartz mill, which is situated some 70 ft. below the level of the mouth of the tunnels, and is connected with them by a car track. The facilities are first-class for cheap and economical handling of the quartz. It is hoped by the owners that when greater depth shall have been attained, a better quality of ore will be met with, but even with the present grade of quartz the mine can be made to pay all running expense beyond a doubt. There is now on the dump and ready for the mill some 2,000 tons of quartz, and from 40 to 50 tons per day can be broken to keep the mill busy when it is ready to run which will be in two or three weeks from the present writing.

The Knox & Osborn being so near to Mokelumne Hill, its success would tend to revive business here and give confidence and encouragement to others to do as Messrs. Knox & Osborn have done in putting their capital and energy in the abandoned and heretofore supposed worthless mines of this district. We sincerely hope that the owners will more than realize their expectations, for they deserve success, as they have already expended about \$30,000 and expect to be out still more before they look for any return.—*Onlawas Chronicle*.

For the year ending June 30th, 1880, the issues of postage stamps, stamped envelopes and postal cards, on which the revenue of the Department mainly depends, aggregated in value \$32,087,342, a 9% increase over the previous year.

The Treasury Department has ordered that on the 15th inst. the work of printing the internal revenue adhesive stamps be transferred from the Columbia Bank Note Company of New York to the Bureau of Engraving and Printing in Washington.

Nothing short of Unmistakable Benefits
Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SARSAPARILLA enjoys. It is a compound of the best vegetable alternatives, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for eczema, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humors, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weakness and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It tones up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been in extensive use, and is to-day the most available medicine for the suffering sick anywhere.

Australian Patents.

The attention of Pacific Coast Inventors is called to the benefits which may be derived from Letters Patent of the Australian Colonies. We invite correspondence from all who may desire full information on the subject. The geographical location of San Francisco gives an advantage in our favor over Eastern agencies, rendering it possible for us to transact business in much less time.

Send for our circular giving full information regarding Patents for the following countries: Victoria, New South Wales, Queensland, South Australia, Tasmania, New Zealand, East India, Etc., Etc.

DEWEY & CO.,

U. S. AND FOREIGN PATENT SOLICITORS,
202 Sansome St., San Francisco, Cal.

For Help or Employment

Call on C. R. Hansen & Co., a prompt, enterprising and reliable firm. Their New Female Employment Office, at No. 110 Geary Street, has never been excelled in this city. For help of all kinds, call on them, or write for information, or send your orders to the above address.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grout walled with aquaria constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

J. G. COLMERE is requested to report to this office. He went to Humboldt County, Cal., about May 4th, 1880, and Agency for this paper has been revoked for good and sufficient reasons. Mr. C. is a heavy set man, of dark complexion, weighing some 175 pounds, or more.

Chew Jackson's Best Sweet Navy Tobacco.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

Hoisting and Pumping Machinery.

STEIGER & KERR'S

CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of ironing is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

DEWEY & CO'S

Scientific Press

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

Assayers' Materials.

John Taylor & Co., of this city, importers and dealers in assayers' materials, mine and mill supplies and chemicals, have just issued a price list of assayers' articles, for the convenience of persons in the mining districts. It is by far the most complete list published for practical workers,—assayers, mine and mill owners. Some catalogues have been printed previously in the East, but they are more particularly for colleges. This has not been done before to any such extent by anyone, with the wants of the mining community particularly in view.

This firm was established in 1852, and from long experience and peculiar advantages are perfectly familiar with the wants of the mining public. They can also offer greater inducements than Eastern dealers, no one of whom has so large and full varieties of the right kind of goods for purchasers in our large mining fields.

They have very sensibly attached prices to nearly all the articles required by an assayer, and the cost of an outfit can be estimated very nearly. All articles are purchased as low as they can be had in the market. The French, German and English crucibles are imported direct by sail vessels, and from the largest manufacturers. And it may be said, in general, that the mining interests, in their various forms, having been the leading interests in California and the other Pacific Coast States and Territories for many years, it is believed that all the articles required in connection with the mines, including machinery of all kinds, chemicals and incidental supplies, can, on the whole, be obtained to better advantage, and of more satisfactory quality, in San Francisco than elsewhere.

The demand for many of the chemicals and compounds for assayers' use and for reducing ores being, in many cases, for small quantities, the firm keep a full stock on hand put up in convenient sized packages. The firm are the agents for the Battersea works, London, England. Their new and commodious quarters are at Nos. 118 and 120 Market and 15 and 17 California streets. At no other place will he found so full an outfit for miners and assayers. It is really worth a visit to anyone interested in such things, to see the great variety of articles and substances which are here displayed.

DEEP SPRINGS.—The *Inyo Independent*, in speaking of this camp, says: Work is being quietly prosecuted by W. A. Greenly, Scott Broder, Billy Lake, and others, who own claims, their idea being to develop and show up their mines before inviting any more capitalists to come and look at them. These men have perfect confidence in a bright future for Deep Springs, and they are determined to "stay with the works." A shaft has been sunk on the Indian Scout mine 50 ft. deep, which shows a continuous vein of ore all the way down, with three ft. of ore in the bottom; drifting on the vein will soon be commenced from the bottom of this shaft. A shaft is now being sunk on the Greenly claim, which is on the same ledge, and adjoins the Scout; the prospect in this claim is of the same encouraging character as the Scout's; the ores from these two mines are of the same general character, being milling ores carrying both gold and silver. The average assays from a large number made is \$75 to \$80, which includes about \$15 in gold per ton. The Indian Scout is an immense ledge, having some 10 locations on it of 1,500 ft. each, which can be seen the whole distance, and rich ore can be found on the surface on any of these claims. There are a large number of other first class prospects in the district, on some of which work is being prosecuted. The ledges are large and are enclosed in well defined walls. We are satisfied that in a few months more Deep Spring district will show up some mines that will "astonish the natives."

The Ontario mining company paid a dividend of 50¢ per share in N. Y., Saturday. It is said that this makes \$3,000,000 paid to stockholders. Good for Utah.

An Improved Soft Patch Bolt.

This simple improvement in soft patch bolts, as shown in the accompanying cut, consists of two holes drilled in the end of the bolt, so as to form an eye for the insertion of a copper connecting hook by which the bolt is fastened to the wire or string that passes through the hole where the bolt is to be placed. After the bolt is drawn into position, the wire or string is removed from the hook and the nut put on. The workman, by means of this connecting hook, has full control of the bolt, so as to keep it from turning or dropping out of place. The hook can be removed from the bolt by simply bending the end a little to one side. This device is protected by these patents. The following are some of the advantages secured by using the improved soft patch bolt: Saving of time; facility in the attachment and removal of the

ELLIOTT'S IMPROVED LACE CUTTER.

wire; reduced size of bolt holes; security against loss of bolts, as they can neither slip from the wire nor drop through the hole; full control of the bolt until the nut is screwed up; ease of entrance by reason of the pull on the bolt being central; frequency with which the same connecting hook can be used.

In offering this bolt to the trade on this coast, Messrs. Dunham, Carrigan & Co. feel confident that they are presenting a long-needed article, and one that only needs to be seen to be appreciated by engineers, hoiler makers and others. These bolts are made of best refined iron, and are first-class in every respect. The copper connecting hook, as shown in the cut, is

HALL'S IMPROVED SOFT PATCH BOLT.

so simple in construction as to obviate the necessity of furnishing it except with samples.

BROOKLYN MINE.—The *Belmont Courier* notes that the Brooklyn is one of the most promising, and so far has proven the most productive new mine ever developed in that county. The incline is down about 140 ft., the bottom being north of the ledge. The owners will crosscut to intersect it at this depth as soon as the hoisting works are ready. A drift, however, to the west of only a few ft., at a depth of 35 ft. from the base of the mountain, where the incline commences, has just developed an immense chamber of ore, at present of unknown dimensions. The ore is remarkably uniform in its character, and will assay about \$100 per ton. A large quantity is already on the dump on which the Alexander mill will shortly make a run. The product will be all "sugar" for the owners, the mine having more than paid expenses from the start, and you will soon see it in the front rank.

To a man traveling from Mason valley to Candelaria, says the Candelaria (Nev.) *True Fissure*, it seems that every man along the road owns a quartz mine or has good prospects for one. Even out in the middle of the deserts one will occasionally see location notices tacked to rude posts, announcing the existence of mining claims.

California Mining Machinery for Japan.

The *City of Peking*, which sailed this week for Japan, had among her freight a large quantity of mining machinery manufactured at the Pacific Iron Works in this city, and consigned to the Japanese government for use in the mines of Japan. This machinery was an addition to a mill already running there, consisting of a battery, pans, settlers, retorts, shafting, etc., altogether about 100 tons, making a complete 20-stamp mill. The order was from the government direct. The same foundry sent also to Japan a few years ago a plant for a rolling mill, which we understand is in successful operation, in connection with an iron blast furnace.

The first mill, sent by the Pacific Works some eight years ago, they speak very highly of, and claim to be getting excellent results with

Mining Camp "Booms."

A very general tendency is apparent in new mining camps to give them a "boom" right off, before there is anything to "boom" on. At the same time there is not a doubt but that the manufactured "boom" does more harm than good. It is time to blow the trumpets and wave the flags when the procession is in sight. But if all the excitement is over before it gets round the corner it doesn't look as well as it might, and somehow it is disappointing even to the most enthusiastic.

"Booming" a camp prematurely is just like building a big mill before the mine is opened. The mill looks first rate; sounds well in the papers to have its starting up announced, and it makes a good deal more noise running without ore under the stamps than it does when the batteries are well fed. But it doesn't pay. Without ore the mill lies idle. People look at the machinery and say the mine can't amount to anything if it don't furnish ore to its own mill. They don't think of the lack of judgment that led the company to buy the plant. They only see the bad results. The excitement about the mill is over for it is built, and if, at last, it does get to work they say "it is about time for something to be done."

It is just about the same way with mining camps. If people will get up an excitement, and bring their camp before the eyes of the world before it is worth seeing, they must expect lack of enthusiasm when it becomes worth seeing. People would rather see a little more than they expect than less. They would rather throw away \$10 than get swindled out of 10 cents. They don't like being caught with chaff. If a practical mining agent goes to a camp and finds only a dozen or so holes 25 or 30 ft. deep, called shafts, he can't be expected to return and report to the capitalist that the place is a first-class one. These kind of "mines" prove very little. The owners cannot sell them for prices up in the thousands.

It is best to get a new camp into some kind of shape before starting its "boom." Many a one has dropped out of sight altogether by premature publicity. It is hard to get people back again when they have once left, and left with bad impressions. No temporary excitement is healthy, but permanent improvements speak for themselves. Many a district now languishing for want of proper support from capital, owes its ill fate to the injudicious booming it received at the outset.

A Convenient Lace Cutter.

Since the universal adoption of helting as a means of transmitting power, no little attention has been paid to devising means of uniting the two extreme ends of a belt, in a manner both efficient and easy of application. Perhaps the first thing ever used for this purpose was a thong or lacing cut from thin tough leather, and passed alternately through holes punched in either end of the belt, very much after the fashion of lacing a shoe, from which the idea was probably taken.

Judging from the amount of lace leather annually made, it would seem that the method of lacing helts was by no means the least popular. The disadvantages of cutting these lacings with a knife are so great that many consumers prefer to buy "cut lacings," notwithstanding the fact that they are seldom just what is wanted.

This objection is fully obviated by the use of the little tool shown in our engraving, which cuts and points lacings of any length or width as wanted, and without loss of time or leather.

The construction of this lace cutter will be understood from the engraving. It is a practical and well made tool, the result of a long experience in the manufacture of tools of this class by the inventor, who was the first to place a lace cutter upon the market. Sent by mail on receipt of 50 cents. For sale by Dunham, Carrigan & Co., San Francisco.

LAST week the California mine produced 1,214 tons ore, assaying \$22.15 a ton, and the Consolidated Virginia 1,203 tons, assaying \$21.10 per ton.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EWS

Tombstone, Arizona.

EDITORS PRESS:—Mineralogists, geologists and experts generally, are at sea when they first arrive in Arizona. The country has to be studied to be understood. It is unlike any and all countries where minerals have been found in quantities. The idea of ledges and true fissure veins must be rooted out of the expert's mind before he can properly estimate a mine in Arizona. There is no such thing as a fissure vein here. There are ledges and lobes; they are loog and deep, but they are not pinched up between two solid formations. Occasionally granite or porphyry comes in and squeezes a ledge of ore into a narrow compass and forms what appears to be a fissure vein, but when it is followed 10, 20 or 50 ft. the walls disappear and an inexhaustible body of ore is opened. This has been the case in every mine that has been opened in this district. Some have struck the ore near the surface and others have had to sink over 300 ft. before they found it, and when once found it never gives out, and none have failed to find it who have persevered. Many claims have been located with not even a float in sight and have found immense ledges of rich ore by sinking 100 ft. There is a vein of mineral, if vein it may be called, which is easily traced for a distance of 30 miles long by 1½ to 2 miles wide. Its course is northeast and southwest. It runs from the Huachuca mountains through Tombstone to the Dragon mountains. Its course is straight and well-defined. Anywhere and everywhere that shafts have been sunk to any depth on this belt rich ore has been found. It is true some rich ledges have been found outside this belt, but they are only spurs or limbs running out from the great trunk. The character of ore, however, in these side veins is quite different to that found on the main belt. It shows a darker color and more iron, while on the main belt it is carbonate and chloride, dark brown and yellow color.

In confirmation of what I have said, everyone familiar with the ground knows that, starting at the town of Tombstone and crossing the ridge in a S. W. course towards Charleston, for a distance of 10 miles the belt can be easily traced to the valley of the San Pedro, and its width extends from the old Bronkaw on the west to the Bradshaw mine on the east. We do not mean to convey the idea that these mines form the extreme boundaries, for they are not quite one mile apart. But scores of mines have been found between these, and but very few outside. Keeping a straight direction on to the Huachuca's on the foothills, many miles this side of the main range, it crops out again and continues across the mountain range. So, on the other hand, this mineral belt has been traced six miles northeast towards the Dragon range. Then, crossing the deep depression of the valley, it crops out again on the foothills of that range and runs through that range. On one of the high ridges of the Dragon's is situated the celebrated Mary A. mine, now acknowledged to be one of the largest and richest deposits of ore in the Territory. Immediately in the vicinity of this mine numerous others have been discovered, all rich and developing into splendid properties.

I have not examined personally the country beyond these points, but, in conversation with a geologist who recently examined the country as far as Stein's peak, 80 miles northeast, he informed me that the vein or belt cropped out in every range of hills between the Dragon's and the peak, and that many valuable mines had been discovered and are now being developed, some of them near the peak in Granite pass. How much farther it runs civilized humanity has not determined.

QUARTZ.
P. S.—Since writing the above we met an old friend of the late Prof. Davis, who informs me that the professor spent a long time examining the mineral deposit of this district, and that he advanced precisely the same theory as the above.

NEW MINES.—Says the Bodie News: About six weeks ago an old prospector ascended the high ridge constituting the divide between the East Fork of the Walker river and Sweetwater, and there he discovered an immense silver ledge which looks like the first south croppings of the Comstock. Since this discovery a number of prospectors have visited the new district—which is about eight miles from Henry William's ranch—and a great many claims have been located. The assays are of such a nature as to induce the belief that the new discovery is one of the most important made in this part of the country for many years.

DISCOVERY OF A NEW GOLD-FIELD IN AUSTRIA.—Great excitement has been caused throughout Austria by the discovery of the Temora gold-field, near Sydney. The rush of people into the township, says the Sydney Morning Herald, increases daily, men arriving even from Victoria. The great drawback to the development of the field is want of water for puddling purposes. Gold is being struck very freely. Pegging out and sinking are rapidly going on, and bark huts and tents are springing up everywhere along the road.

Northern Sierra Mines.

Encouraging Prospects of Gravel Mines.

From a very extended review of hydraulic mining operations in Sierra county, published in the *Mountain Messenger*, we take the following: Never in the history of mining in northern Sierra, has a season been more prosperous for our drift and hydraulic mines than that of 1880. During our recent hurried trip through the old camps, not a single dissatisfied miner did we meet. All were joyous over their rich foraging raids, and sanguine that the future is bright with promise of still larger golden harvests. As convincing proof that there is substantial foundation for this belief, are the total shipments made by the Bank of La Porte, of gold dust and bullion for 18 years previous to 1873, equal in value to \$60,000,000. Four companies at Howland Flat and Potosi, Down East, Union, Hawkeye and Pittsburg, realized from 2,365,000 square ft. of bedrock \$2,251,653.95, pay gravel being estimated at four and a half ft. in thickness, an average of 95 cents per square ft., or \$5.70 a cubic yard of gravel washed. The material was mined and washed at a cost of 47 cents a square foot, leaving a profit of 48 cents. These estimates do not include the heavy yields of many very rich diggings whose returns could never be traced. Attracted by the favorable inducements thus held out to them, capitalists from the leading money-centers abroad are already anxiously seeking judicious investments for their surplus funds, as is evidenced by the recent honing of numerous lucrative mines from the rich gold leads of La Porte through Gibsonville to Howland Flat, St. Louis and the broad acres of valuable hydraulic claims in and around the somewhat isolated but productive mineral region of Morristown. All this augurs well for the hardy sons of toil to whom Sierra is indebted for the greatest measure of her success as the hanner mining county of the State.

La Porte.

This old mining camp has some of the richest and most extensively worked hydraulic mines on the coast, which have added thousands and thousands—near into millions of dollars to the world's store of gold; and still there is no cessation of the golden shower. Extensive preparations, complete in every detail, are being made for a vigorous campaign next season, which promises to eclipse that of many a previous year since the days of old, and the day of gold, and the days of '49.

Gibsonville.

As a rich mining center, this section of Northern Sierra has held its own against heavy odds remarkably well, and will probably continue to do so for the next decade. The proof of this is clearly indicated by the unmistakable geological evidences on almost every side. The entire ridge of miles in extent between Gibsonville and La Porte is believed to contain as rich a gravel channel as was ever our noted prolific Bald Mountain. Such is this confidence that all of the territory in that direction has been marked out and located; and as soon as practicable, tunnels will pierce the mountains from most every point of the compass, to ascertain the truth or falsity of this theory. The

Union

Has suspended operations, except as regards its main tunnel, which is being driven into the back channel, 700 ft., by a double shift of four hands. The

Michigan

Is running for the same point, and takes out some pay, employing 12 men. The

Gravel Hill

Hydraulic mining company has just finished its clean-up, with "satisfactory" returns. Your old ex-stable man, Ike Thatcher, has charge of a gang of men repairing ditches and sinking cuts preparatory for next season. The corporation is—Geo. Cox, W. F. Lang and F. A. Gourley, three of the most successful and experienced miners in the State.

E. Squier & Sons

Are working from 12 to 15 men, and take out very good pay with prospects of soon doing much better.

H. Tabor

Is repairing his tunnel, now in 2,000 ft., and contemplates pushing vigorously ahead for the back channel this fall and winter.

Mines Bonded.

The Go Ahead and Gibsonville Consolidated ground between Gibsonville and La Porte, has been bonded to H. Wallis and Jas. McGregor, of Forest City.

Newark.

The mines around here are not very active just now, but the prospect is very cheering of a general revival in this section ere many months have rolled around. At Hepsidam, a short distance above, the

North America

Has done a good season's work, with fair dividends. From 40 to 50 men are employed. The upper tunnel is being run for the back channel. The lower tunnel is also being worked, was finished about a month ago. The

Pilot Peak

Gravel claim, amongst the most promising mines in this part of the county, would be a most desirable investment for capitalists, and could be purchased at a fair price and worked advantageously with good interest on the sum

Sears Union Water Co.

Has had a very good clean-up this season. Our accommodating and genial hydraulic friend, Mr. Cox, dazzled our eyes with a "sight" at about 100 lbs. of bullion. Many large shipments have been already made, and more are under way. The boys are still engaged in pounding out the gold, and also are busy scouring out the balance of their gold harvest in their claims, previous to putting them in order for another year's run.

H. H. Crittenden & Co.

Are flush with golden ducats this year from the usual heavy yield of their hydraulic mines, and are pushing through a new tunnel for the more thorough development of the same. The

Bonanza

Gravel claim, at Potosi, above Howland Flat, is bonded for \$225,000, and will probably be sold this fall. The gravel in some of the breasts is so rich with gold that it can easily be picked out with the aid of a miner's candle-stick, by the handful. In company with the foreman (and one-third owner of the mine) Alex. McNeel, we explored the gangways and breasts, and he generously allowed us the privilege of retaining enough of the gold we found for a bonanza ring, a lucky windfall sure enough for a printer, and one to which he does not fall heir to more than once in an ordinary lifetime. Mr. McNeel is one of the oldest settlers of this county, and thoroughly understands the science of mining. The Bonanza tunnel is about 4,000 ft. in length, and the atmosphere through, owing to the air shaft, clear and bracing. Alex. declared that he was "pressing her for all she was worth," and if he don't bring her to time, the company had better close down the mine. Altitude of Bonanza lead, 5,850 ft. above sea level.

Poker Flat,

Way down in the deep, precipitous canyon, where in early days over 3,000 hardy, adventurous miners attended a circus, still has a large gold reserve, though rather securely hidden in the fastnesses of her mountains.

Fred Brockerman

Has made heavy shipments below from his rich hydraulic mine, and Carr's hydraulic and bank claim, east branch of Canyon creek, is paying well.

Kendal & Co.'s.

Hydraulic ground, Little Grizzly, have succeeded this year far beyond their most sanguine expectations. C. R. Scott has done as well as usual this season, and has our best wishes for a lucky find at no distant day in his gold range.

St. Louis

Has her full share of the gold leads, and the mining interests here were never more thriving.

Morgan & Donahue

Are reported to have taken \$115,000 worth of bullion out of their hydraulic diggings this year.

Brundrige & Welmer's

Drift claim has a large amount of gravel in the dump which will be washed in the course of a month; and is expected to yield, as heretofore, "satisfactory" returns.

Brundrige & Conlan

Commenced work recently on their drift claim, and are breasting their back ground. The gravel is rich with gold, and no sardine of a bonanza, judging by the healthy-looking nuggets so often found.

Morristown,

With its hundreds upon hundreds of acres of productive deep gravel banks, has a record that cannot be equaled or excelled by any mining camp in the State. For miles and miles all the ground has been located and bought up until it is now about all concentrated in the hands of a few experienced and energetic miners by whom it has been most successfully worked for many years past. They are associated in what is known as the

American Hydraulic Company,

Whose revenues this season have indeed been princely. A bargain is nearly consummated for the sale of these rich diggings to New York capitalists. There was about three months' water season this year. Usually it lasts for about double that time. Richer ground found this season than for years. Fifty-seven men were employed washing down six claims 100 ft. square, averaging each \$8,000; \$165,000 was taken out of this mine one season. About 10 years ago, working bottom, \$1,500 was realized in 24 hours. One partner sold out his one-tenth interest a few years ago for \$45,000. Fifteen hundred inches of water are used in piping season. Outward indications go to show that this rich gravel range extends up to Deadwood and Big Grizzly. The most wonderful feature about this mine is that it has never needed any assessments, having paid dividends from the start. The gross yield for the past 28 years since '52 has been over \$7,000,000, during which time but 200 acres were worked, and half of that at Craig's Flat. Early in the period of its development, 2,000 ft. of deep bedrock tunnel, for tailing purposes, was run at an expense of \$67,000. There are 1,340 acres yet undeveloped, 12,000 ft. long by 6,000 ft. in width. This summer \$16,000 was washed out of one small tract of ground with only \$5,000 expense. When the New York company begin operations, a new ditch six ft. wide and three ft. deep will be constructed from Canyon creek and the two Grizzly canyons, and extended onward to Craig's Flat. A store and boarding-house is to be erected,

the year. Drifting will be prosecuted during this winter months. It is estimated that fully 100 men will be needed, which desirable addition to the somewhat sparse population of Morristown will transform that now rather slow-going town into one of the liveliest and most prosperous mining camps in California. One hundred ounces was an ordinary day's yield in early times at Craig's Flat.

The Washoe Placer.

Orndorff & Co. are still engaged exploring the old river channel in the foothills of the Sierra Nevada mountains, west of Washoe lake. The channel of the ancient river appears to have been a deep chasm cut through the solid granite of the hills at right angles to their course. The sides of this chasm are in the form of terraces. The shaft of the company was sunk vertically to a depth of 100 ft. through gravel, when there was reached what was at first thought to be a huge granite boulder. From a little crevice in this rock was taken smooth, washed gold in rather coarse pieces to the value of \$5. The shaft was then sunk a further distance of 18 ft., when it became evident that what had been thought a boulder was bedrock.

A drift was started on this rock and run horizontally a distance of 20 ft., the bottom of the shaft (18 ft.) being filled up with dirt from the drift. After the drift has been run 20 ft. on a level the rock suddenly broke off and for 9 ft. it went down perpendicularly. Then the rock went off at an angle of about 50°, and at last accounts was still going at this pitch, having been followed down 34 ft. These terraces are water-worn and in places as smooth as glass. How far the bedrock will keep its present angle no one can tell. It is liable at any time to again either become vertical or to run off on a level. Orndorff & Co. are determined to follow up this rock and find the bottom of this mysterious channel. In 1861-62 a Carson City company undertook to prospect this channel. They got down among these same terraces, and soon had so many drifts and vertical shafts of various lengths and depths that they gave up the enterprise in disgust. The Carson men, however, started their first shaft but a short distance from the edge of the channel. By going out further, and making their first shaft 100 ft. deep, the present company no doubt escaped several of the terraces that bothered the Carson folks, yet they are beginning to find themselves working at a great disadvantage. They must now bring all the dirt extracted up a steep slope a distance of 34 ft.; it must then be hoisted vertically 9 ft., when it must be wheeled on a level 20 ft. and finally hoisted 100 ft. to the surface through the main vertical shaft. All who know the place are quite confident that at the bottom of the channel, if it can ever be reached, will be found "bushels of gold." The reason for this belief is that in 1861 a small overflow from the ancient channel was found which was immensely rich in coarse gold. Although the gold was only found in one place—a short and shallow ravine that headed at the edge of the ancient channel—yet during the mining of it quite a lively little town was built up. There was a hotel, meat market, saloon and shops of various kinds. The stream of golden nuggets was followed up until it dipped into the hill, and till this day nothing more has been seen of it except the \$4 in dust found at the bottom of the vertical shaft of the present company.—*Virginia Enterprise*.

Johnson's Gulch.

This not euphonious name was given at some period in the past to a beautiful pass between the Red and Wet mountains, which onto the chain about one mile north of Bassick mine. At one place north of, and near Tyndall mountain, this pass widens out and becomes a park, through which a limpid brook, fed by springs, threads its way. Two years before silver was discovered at Silver Cliff all of this park was staked as placer claims, but was deserted and apparently forgotten in the wild rush hither when the Racine Boy was discovered. On the hills which form the southwestern wall of this pass, Mr. E. J. Haskell, of Rockford, Illinois, with W. J. Bradley and Abe Thompson—two old California miners—found the outcropping of a vein of hematite, which they traced from Herring to Tyndall mountain, a distance of about one and a quarter miles. On this vein they have located the Winneago Chief, the Golden Eagle, American Eagle, American Flag, Iron King, Iron Queen and Gray Eagle claims, all of which they are working, aided by interested parties of means who are now residents. They are doing their work with a quiet determination which wins in the long run, and though but little depth is gained at any one spot, the value of the vein is so apparent that we feel safe in saying the group of claims laid along it will be known as one of the richest in the district. It is the earnest, persistent labor of such men as Haskell, Bradley and Thompson on which we must rely to lay broad and deep the foundations of the future city of Silver Cliff.—*Silver Cliff Prospect*.

ENGLAND has 2,930,000 operatives, whose average annual products are £224; Germany, 2,781,000, who produce annually, each, £103 in value; France, 1,936,000, whose annual products average £220 each. The value of the textile products produced in the United Kingdom is £155,000,000; United States, \$420,000,000; Austria, 1,340,000, who produce annually, each, £103 in value.

MECHANICAL PROGRESS.

The Piedboef Boiler.

This boiler, which has been brought out in Germany and has been exhibited recently at the Dusseldorf exhibition, consists essentially of two cylinders, one above the other, in both of which there is a steam space, instead of the upper one only. The lower cylinder is in this case an ordinary Cornish boiler, with internal furnace exactly as usual. At its back end it is freely connected, by a short pipe of large diameter, with an upper cylinder not quite so long as itself, through which pass, from end to end, a number of ordinary boiler tubes. Inside the Cornish boiler, just in front of the vertical connecting pipe, is fixed a diaphragm plate, extending downward from the top of the shell about eight inches, and so coming within four inches of the furnace top. The upper space in front of this diaphragm plate is connected with the steam space of the top cylinder by a pipe having in it a plain single heat valve opening freely upward. As a matter of precaution this valve is connected with a float on the lower cylinder, which opens it as steam is formed and the water level lowered, but this is not an essential part of the system. By this arrangement, as can readily be seen, it is possible to have steam in both the lower and upper cylinders. As it is formed in the lower one it passes quietly off through the stand pipes into the upper steam space, there being always a certain unbalanced head of water in the back part of the boiler (where the two cylinders are connected), to insure the right motion of the steam. The gases are carried up from the back of the Cornish boiler and pass to the front through the tubes of the upper cylinder and then back again in the space surrounding the shells, so that there is apparently no danger of the shells being externally burnt. This arrangement also makes the danger of accident from low water a very small one, as the furnace itself cannot be uncovered unless the water level actually falls about seven ft., the water entirely leaving the upper cylinder, which could hardly happen without notice. The boiler has a total heating surface of 1,570 square ft., of which 1,100 square ft. is internal surface and 33.3 square ft. of grate, the ratio of total surface to grate being therefore 47 to 1. It has been used for supplying steam for an engine under trial working at 100 effective horse power and was working nominally at six atmospheres.

Rust-Proof Iron.

Mr. George Bower has invented, and his son has improved a process for coating iron with an indestructible surface of magnetic oxide, which is said not to be open to the objections to the Barff process.

The Bower process, which is not secret, consists in heating the articles to be coated in a closed chamber by means of carbonic oxide, heated air being made to enter the chamber for the double purpose of burning the gas and for combining with the iron. The excess of air, after burning the carbonic oxide gas, combines with the iron, forming first the magnetic oxide, and then the hydrated sesquioxide, or common iron rust. By shutting off the supply of air until only enough is admitted to burn the carbonic oxide, the rust is converted into the magnetic oxide. The process is repeated until the film is sufficiently thick for the purpose of protection. When complete the film has a beautiful French gray tint.

The London Times states that the application of this invention has been undertaken on a large scale, the chamber where the oxidation is now carried on being large enough to contain about a ton of miscellaneous articles. The value of the invention, and of the method of applying it, is no longer a matter of doubt, the severest tests having been made of the iron coated. The earliest experiments only produced a film that would peel from the metal; but by the new method a coating is made which is inseparable from the metal. Inasmuch as the cost of oxidation is less than that of a coat of paint, it has become evident that the next generation, at least, may be happy with cheap and indestructible iron.

ANNEALING STEEL.—There is much carelessness in annealing steel articles which are to be wrought, and much trouble occurs from not properly softening steel before it is given to the bench workmen, the lathe man, or the planer. There is little of true cast steel that has any life in it that can be properly annealed by a heating in a forge fire, taking it out and holding it in the shadow and then plunging it in water when it ceases to glow. It is poor steel that will not contract hardness when thus treated. When it is considered that a spring temper is so low that the amount of heat by Fahrenheit will give 579°, and that this heat will show no glow in the shade, it will be seen that this method of water annealing is not reliable. When a piece to be annealed has been heated to a red it should not be exposed to the air a moment, but be plunged into a bed of fine cinders, air-slaked lime, or charcoal powder. The last is the best, and a dry bath of mingled lime and charcoal particles gives excellent results. There the piece should be left until entirely cold, or until the hand can bear its heat, and even then it is not best to cool it in water.—*Boston Journal of Commerce.*

MARINE ENGINE ECONOMIES.—Prof. John Gamgee has written a letter to Senator Blaine, in which he ventures some statements respecting steam-engine economies at sea, which will be read with interest. He says: "The time has arrived for superseding the wasteful engine, which utilizes about 5% of the coal burned in the boilers. Improved methods of engine construction and a correct knowledge of the laws of heat enable us to adopt a new system, in which high pressures are secured at low temperatures, approaching much more than the steam engine to the animal mechanism, which develops motion and unlimited horse-power below blood heat." In referring to the capability of engineers in this country who have developed this theory, he concludes the communication as follows: "Engine must be made like Waltham watches—entirely by machinery and of uniform excellence. Engines can be designed wasting only 25% instead of 90% of fuel. In short, wooden vessels can be built to cross the ocean at an expense for navigation little, if at all, exceeding the sailing ship, and filled with merchandise instead of coal. They can be driven as fast as by steam, enduring longer than metal ships, and affording at least equal chances for comfort and safety." It is very easy to write this kind of thing, but while the time has come for this kind of ships, the ships are still coming, and it would be difficult to say how soon they will arrive.

INCREASE OF MOMENTUM WITH INCREASED

SPEED OF RAILWAY TRAINS.—Some recent experiments with train brakes in England have afforded a new and practical exemplification of the laws of momentum as applied to the stopping of trains—laws which seem to be too often forgotten, under circumstances when forgetfulness may lead to some serious accidents. During the trials the Westinghouse brake stopped a train moving at the rate of 41.5 miles an hour at a point only 455 ft. distant from the place where the brake was applied, but when the speed was increased to 61 miles per hour, the distance run after the application of the brake was 1,185 ft.; and when the speed of the train was increased to 67 miles per hour, the distance traveled was 2,055 ft. This result was not confined to the working of the Westinghouse brake, as similar results were obtained when other brakes were used. This trial would indicate that 50% increase on the initial velocity of 41.5 miles would require an increase of 148% in the stopping distance, or 3 to 1. An additional increase of 10% demands an increase of 73% in stopping time, or 7 to 1; or, as compared with the original figures, an increase of 61% in speed demands an increase of 343% in stopping time. This is a danger signal that should be heeded.—*Iron Age.*

INFLUENCE OF LIGHT, COPSE AND MOLD ON FOREST GROWTH.—M. Gurnaud has conducted a series of observations, during the past 19 years, upon the solid contents of annual growth in a forest among the Jura mountains. He finds that: 1. Light, when it strikes the ground without having been sifted by foliage, stimulates the production of carbonic acid in the decompositions which are engendered by the humus, together with a decomposition of the same gas by the chlorophyll. 2. The growth of wood diminishes when the underbrush intercepts, to any great extent, and the access of light to the soil and diminishes its reflex action on the branches of the trees. 3. This interruption of reflex action is due mainly to the spread of the underbrush, for when it is kept trimmed the vertical shoots which are retained interpose no obstacle. 4. The mold, under too great a thickness, loses a part of its virtue, and, like barnyard manure which is too deeply buried, remains inert for many years.—*Comptes Rendus.*

AN IMPROVED PROPELLER.—An invention which is attracting considerable attention among shipbuilders in England is the De Bay propeller, which, there is every ground for believing, will considerably reduce the enormous waste of power of the screw now so generally adopted for the propulsion of steam vessels, although the loss of power is from 40% to 50%. The propeller consists of 2 screws, which are revolved in contrary directions. The 2 screws are mounted on shafts of which the one revolves within the other, the one screw having 3 blades while the other has 4. These are of peculiar shape, being so formed that each blade has projections where the other has depressions. A steamer, the *Cora Maria*, was fitted with the propeller, and it was found that while she steamed 8.73 knots with an ordinary screw, her speed was 11.28 knots, a saving of 29.2%, with practically the same expenditure of power.—*Iron.*

HEAVY MACHINERY.—The St. Chamond Steel Works, France, boasts of having the largest lathe in the world. It was manufactured by Sir Joseph Whitworth & Co., of Manchester, England, and has just been set up in France for turning 100-ton guns. Perhaps the heaviest general plant of machinery in any one workshop in the world is to be seen in the extensive machine shop connected with the Royal Arsenal at Woolwich, England. In this shop there is a planing machine capable of giving a true surface to iron plates 6 ft. wide by 30 ft. in length, also a lathe having a face-plate 9 ft. in diameter, which will turn a mass of iron of any weight which it is practicable to handle.

SCIENTIFIC PROGRESS.

A Novel Mode of Cutting Iron.

Some time since it was announced that Mr. Jacob Reese, of Pittsburg, Pa., had succeeded in cutting iron and steel by simply revolving near it, at high speed, a thin disk of steel. We are now in position to give some additional details and present illustrations of his "fusing disk." The disk is 42 in. in diameter, scant 3-16 of an inch thick, and smooth on its periphery. It is made either of wrought iron or of soft steel, is nicely balanced and runs at a velocity of 25,000 ft. a minute at its periphery. Mr. Reese holds that it is the impact of the particles of air hurled with great velocity against objects held near the periphery of the disk that effects the fusion of steel. A groove is instantly melted into a round bar of steel held before the fusing disk, and the steel drops down in a fused metallic state. When the motion of the disk is stopped, it may be noted that the disk does not touch the bar of steel, there being a space in each side and in front of it. This is proven by the fact that while the disk is only 3-16ths of an inch in thickness, the groove made into the steel is 5-16ths wide, thus showing an air space of 1-16th of an inch on each side and in front of it. When the disk is in proper order, so that it has no lateral movement, the ends of the bar melted through are smooth. It is stated by Mr. Reese that the operation of the fusing disk differs from the "cold saw" so widely used for rails, etc., in one important particular. The dust from the cold saw is thrown away from the latter as an oxide, while the fusing disk melts the metal.

In practice, the round bar to be cut is placed in the chuck and caused to revolve at a rate of 200 revolutions per minute in the same direction as the disk. When the disk is traveling at a velocity equal to 25,000 ft. per minute, the instant the bar is brought near the disk fusion takes place, and as the bar is turned by the chuck, a gutter is melted around it, and as it is fed nearer to the disk, the gutter is deepened until the bar is severed. A 2-inch round bar of cast steel has been fused through in 10 sec., and a 1½-inch round bar of cast steel in 7 sec., but in practice such bars require from one to one half minutes to adjust and fuse each section to length. It is stated that the work is done so accurate that hundreds of thousands of gun barrels and revolver chambers have been fused to length and then bored without further dressing. When the rough ends of shafting are fused off by the disk, the ends are ready for centering. A large machine will cut shafting from one to three inches in diameter, while a smaller size has a range of from one-fourth to one and a half inches. The small machine is a very useful one in railroad and other machine shops, as it can be easily operated.—*Iron.*

AN EXTRA-SENSITIVE THERMOMETER.—Prof. Dufour, of Paris, has devised a small thermometric apparatus, which is so sensitive that it will even denote, by a deflection of the index needle of nearly two inches, the entrance of a person in the room where it is placed. By putting the hand near the bulb the needle is deflected the whole extent of the graduated arc. This apparatus, which we find described and illustrated in *La Nature*, consists of a bent tube, carrying at one end a bulb, which is coated externally with lamp-black. The middle of the tube is filled with mercury, and is supported by arms pivoting on a steel knife blade. Just above the pivot is fixed an index needle which moves across a graduated arc. Beneath the pivot hangs a rod, to which is attached by friction a small weight, that serves to balance the needle so as to make it point to zero on the arc. When the temperature rises, he it ever so slightly, the heat, being absorbed by the lamp-black, dilates the air in the bulb, and drives the mercury forward. The center of gravity of the apparatus being displaced, the needle will immediately turn toward the right. When, on the contrary, the temperature decreases the needle will point toward the left. To prevent the instrument tipping over on a sudden and considerable elevation of temperature, two small pins are placed at points beneath the tube. Hooks near the bulb serve to hold substances whose diathermic powers it is desired to ascertain. The heat source is introduced into an aperture in the plate.

SUNLIGHT.—Dr. Carpenter says the entire absence of sunlight on the deep-sea bottom seems to have the same effect as the darkness of caves in reducing to a rudimentary condition the eyes of such of their inhabitants, as fish and crustacea, which ordinarily enjoy visual power, and many of these are provided with enormously long and delicate feelers or hairs, with which they feel their way about, just as a blind man does with his stick.

TRANSPARENT GOLD.—If a solution of gold in aqua regia is centralized by carbonate of soda, and a solution of oxalic acid is added, the gold is precipitated in a brilliant yellow powder. On examining this precipitate by the microscope the flakes are found to have a triangular or hexagonal form and to be translucent, the color of the transmitted light depending on the thickness of the crystals.—*Les Mondes.*

Photographs by Lightning.

Mr. R. Crowe, of Liverpool, communicates to the *British Journal of Photography*, an account of some attempts to photograph a landscape by the aid of lightning flashes. A gelatin plate, requiring by day an exposure of two seconds, was exposed from 10:15 p. m., to 10:45 p. m., during which time there were 120 brilliant flashes and about half as many minor ones. Most of these were in a horizontal direction, and 5 or 6 of them were imprinted on the negative. A perpendicular flash which struck a church tower half a mile away was rendered with extraordinary sharpness and brilliancy. The surrounding objects, in spite of the long exposure were but feebly impressed, whence Mr. Crowe argues that though the light of a flash of lightning is of a very actinic character, there is still not sufficient volume of light to illuminate a landscape or building to allow a successful photograph to be taken. The probable difficulty is that the photo-plates are not sufficiently sensitive. The duration of a lightning flash was found by Wheatstone to be less than a millionth part of a second. We believe there is no record of the successful photographing of any object with a plate exposure of so short a length of time, even in the strongest sunlight.

TO DETERMINE THE HEIGHT AND DISTANCE OF CLOUDS.—Mr. Francis Galton has, in a paper read before the British Association at Swansea, described a method devised by him for determining the height and distance of clouds. The essential principle of this method consists in the employment of two horizontal reflecting surfaces at different levels, the lower being the surface of a still lake, or pond, or cistern, or a large puddle, and the upper being a small mercury trough or artificial horizon. By taking an observation of the cloud as reflected by the two surfaces, and measuring by means of a sextant the angle formed by the reflected ray from each at their point of intersection in the eye, and knowing the vertical height of the observer above the surface of the lake or pool, the whole system becomes a gigantic "station finder," and the height or distance of the cloud may be calculated from its parallax with respect to the vertical distance between the two reflecting surfaces, which then becomes the base line of the observation.

INTERESTING EXPERIMENT.—Signor Agostine finds, says *Nature*, that if through a drop of mercury, lying on a surface not wet by it, a current of electricity be sent in a vertical direction, it rotates under the influence of the earth's magnetism, as may be seen if a few particles of lycopodium powder be strewn on it. Similarly a mercury drop rotates when placed on the surface of a steel magnet, and *e. g.*, the magnet connected with a positive pole of a very weak element, while an electrode penetrating the drop from above is connected with the negative. From the strength and direction of rotation of a number of such drops one may in general make visible the distribution of the magnetic bars themselves, as when an iron bar is brought coaxially near to one end or into contact; also in the latter. The results of previous experimental measurements are thus provided.

DISCOVERY OF A NEW ELEMENTARY BODY IN THE LAVA OF VESUVIUS.—Prof. Scacchi, the celebrated mineralogist and crystallographer, in studying the yellow incrustation which is found on certain portions of the Vesuvian lava ejected in 1631, and which he calls Veshine, has discovered a body which differs in its character from all the known elements. He considers Veshine as a vesiate of alumina, and he regards vesic acid as the oxidized of a new element, *vesium*, which, according to the properties of its compounds, will probably stand between molybdenum and vanadium. Scacchi thinks that veshium may be found in some of the common ores, where its presence has never been suspected because it has been confounded with some of the known acidifiable metals.—*Bull. de l'Acad. Belg.*

NEW DISCOVERIES ON THE NEW ENGLAND COAST.—The United States Fish Commission's steamer *Fish Hawk* has made two dredging trips the past summer along the New England coast. The dredging was done chiefly between 150 fathoms and 325 fathoms, and the yield was immense. More additions were made to the marine fauna of New England than in the previous six years. The discoveries during the two trips were 30 crustaceans and 70 mollusks, more than half of them entirely new; also 33 species of fish, of which 12 are entirely new to science, representing four or more new genera; and 27 were strangers to the fauna of New England.

TESTIMONY OF THE ROCKS.—From a small erratic block, wholly unlike the rock of Mount Washington, found on the summit of that mountain recently, Prof. C. H. Hitchcock infers that the glacial ice was deeper in that region than has hitherto been supposed. The boulder resembles the rocks of Cherry mountain; and if it was carried to Mount Washington by ice, as Prof. Hitchcock believes, Mount Washington must have been totally submerged by the ice sheet at some time during the glacial epoch.

DERBIE MINE.—Nevada City *Transcript*, Oct. 16: The Derby drift mine, of Bloomfield township, is in a prosperous way, and now bids fair to realize the expectations of its most sanguine stockholders. During last month the yield was \$19,400. After paying in enough wood and supplies to last till next spring, all paid for out of that amount, besides running expenses, a snug balance of between \$6,000 and \$7,000 remains. It is reasonably estimated that from this time forth the mine will pay from \$10,000 to \$12,000 per month clear of expenses.

REPAIRING THE EXCELSIOR DITCH.—The annual repairs on

cuted vigorously under the superintendence of Mr. Dike. A portion of the ditch which extends to Newton will be changed so as to run higher on the ridge, and thus give a stronger pressure at the Merrifield mine. The repairs all along the line will be completed in time for the winter.

SAILOR FLAT CLEAN-UP.—Another clean-up has just been made at the Sailor Flat hydraulic mine, and the amount realized was melted into \$3,000 gold bar at the Citizens' bank. The Sailor Flat is owned by practical miners who work in it, and it is about as steady and profitable a producer as any claim of its size in the State.

DITCH REPAIRS COMPLETED.—The repairs along Cascade ditch and at the head of Snow Mountain ditch will be completed to-day. Work on the other branches of the South Yuba company's canals is being pushed ahead rapidly, and everything will be in thorough repair by the time the winter rains begin.

NEW YORK HILL MINE.—Nevada City *Herald*, Oct. 14: The present prospects of the New York Hill mine, which is situated at Grass Valley, are said to be very flattering. It is reported that over \$50,000 has been cleaned up this month, and that the chances are that a larger one will be made this coming one. The stock, it is said, is already worth \$8, and what the value will be in 2 or 3 months is hard to tell, but it has become a regular dividend-paying mine. It is the opinion of many that it will turn out to be the boss mine of the county. D. O. Mills is said to be the largest owner, he having between 7,000 or 8,000 shares.

WORK RESUMED.—Nevada City *Transcript*, Oct. 17: Work has been resumed on the Osceola quartz mine at High and Keady. The old tunnel is being driven ahead, and is now in a distance of nearly 375 ft. A new chute of ore has been recently developed, and it is expected that the mine will be opened up on an extensive scale.

CENTENNIAL MINE.—Grass Valley *Union*, Oct. 19: A clean-up of 60 loads of rock, on Saturday last, from the Centennial mine, gave a yield of \$1,400, or about \$70 per load. The ledge in the mine is looking as well as at any time, being of high grade, and the prospect is bright. The main incline for some time back, and had the ground hard and expensive. In sinking the shaft unusual expense has been incurred, and the Trustees have deemed it best to levy an assessment to pay off an indebtedness for labor which has accrued in consequence. This is only the 2d assessment ever levied by the company, and will amount to \$2,000, which will pay off all indebtedness.

PLACER.

YANKEE HILL MINE.—*Herald*, Oct. 18: The Newcastle gold mining company, 14 miles from Fins, has been making extensive improvements preparatory to their winter run. Last spring the company laid 2 miles of 22-inch iron pipe for conveying water from the Bear River ditch to Yankee Hill with hydraulic pressure. The opening runs were very satisfactory, exposing a fine bank of gravel somewhat cemented in the old channel. In the last 3 months the company has run a bedrock and flume tunnel about 300 ft in length and sufficiently low to work the lowest part of the channel yet discovered. On the 6th of this month they fired 2 blasts, using in one 1,800 lbs, and in the other 15 kegs of powder, and the blasts were very effective, literally shattering the hill from bedrock to surface. The company will commence washing as soon as the present repairs on the Bear River ditch are completed.

PLUMAS.

MINING ITEMS.—Greenview *Bulletin*, Oct. 14: The Plumas Free concentrators, lately put in the mine of the Plumas National company, are completed and will be started up in a few days. In the Green Mountain mine last week the connection was made from tunnel No. 5 with the Blake drift in No. 4. This opens up a splendid body of ore and gives very large reserves, as well as affords increased ventilation in the mine. The new 60-stamp mill is ready to run, and waiting the completion of some work on the tramway, when the mill will be started.

THE MONTE CRISTO.—Plumas *National*, Oct. 16: Within the past two weeks a ditch has been dug, over 2 miles in length, to the Monte Cristo mine, from one of the heads of Buck's creek. The ditch is 12 ft wide and 18 inches deep. Four large reservoirs will be built, 2 at the head of Buck's creek and 2 on Chichamash flat, and it is calculated that they will furnish water sufficient to wash all the gravel that 600 men, working night and day, can drift out. The ditch is completed with the exception of a few rock points which have to be flumed to carry the water. It is almost incredible what an amount of work Mr. Allstrom has performed since his arrival here a few weeks ago. If our county had a few more such "rustlers" as "Russian Hill," it would soon make a different showing, and would have to have an addition of many hundreds of hard-working, industrious miners to take from the rich hills and channels the golden harvest.

SIERRA.

SAVAGE.—Mountain *Messenger*, Oct. 16: We are informed that the Savage placer mining company have resolved to raise up from their tunnel to see what the bedrock looks like above them.

SOL.—The American company's mine, at Morriscourt, has been sold, and the new Superintendent has arrived and taken possession. The ditch will be immediately extended to Craig's flat, and that ground all worked.

CLARK SOLD.—T. J. Hibbert has sold his interest in the mining claim, 4 miles from Bassett's, up Howard creek, to Mr. Cox, of Sierra Buttes. Mr. Hibbert has gone below to Brown's Valley, Yuba county, where his family is.

DITCO.—Morgan & Donohoe are surveying for an extension of their ditch to Oardner's point, to enable Col. Baker to work Orsini Flat. He will work through the Pioneer company's tunnel. The ditch will be 2½ miles in length, and 100 Chinamen are already at work. The water will be piped across Cedar Grove ravine in 2,200 ft of 3-ft pipes. The ditch will carry 3,000 cubics.

THE BALD MOUNTAIN EXTENSION TUNNEL last Thursday morning was in just over 2,000 ft. Bedrock is still very soft and water is now trickling down on the right-hand side of the face of the tunnel. Oravel may be reached at any minute.

NEW MINING COMPANY.—The Black Jack mining and smelting company, whose property is situated in Jim Crow canyon, Sierra county, has reorganized in New York. The capital stock is \$250,000, in shares of \$2.50 each. Trustees—Messrs. C. S. Beuhm, C. P. Pell, O. Oodrey, Jr., J. P. Jones, W. S. Welch, William T. Brown and J. L. Brennan.

TRINITY.

BULLYHOOP SALE.—Trinity *Journal*, Oct. 16: At the Receiver's sale, last Saturday, the Bullyhoop and Occidental quartz mining property was sold to James A. Johnson, of Indian Creek, for the sum of \$5,200, subject to confirmation by the Superior Court.

NEVADA.

WASHOE DISTRICT.—Official Letters, Oct. 19: The dump below the 2150 level is now completed. We are now engaged in opening the station on the 2150 level. When this work is completed a drift will be started east. We are engaged in cutting out a tank-pit below this level preparatory to carrying the pumps down to the lowest workings of the mine.

SIERRA NEVADA.—On the 2300 level upraise No. 1, west drift, has been advanced 16 ft; total length, 181 ft. The west drift from upraise No. 2 has been advanced 12 ft. On the 2400 level the repairs on the station have been completed. On the 2500 level west crosscut No. 1 has been advanced 25 ft; total, 108 ft. Work resumed in the south drift on the 2500 level.

CALIFORNIA.—During the past week 1,242 tons of ore have been extracted from the slopes on the 1650 level of the assay value of \$23.15 per ton. On the 2000 level the joint Ophir winze has been sunk and timbered 14 ft. On the 2300 level the joint Ophir upraise has been extended 15 ft, and the north drift 19 ft.

UNION COX.—On the 2500 level the south drift from the Union shaft has been extended 23 ft. In the south drift from No. 1 winze are cutting down the grade, east crosscut No. 1 has been connected with the south drift from No. 1

winze; east crosscut No. 2 has been extended 30 ft; south drift from upraise has been extended 14 ft, and No. 1 winze has been sunk and timbered 5 ft.

COX VIRGINIA.—During the past week there have been extracted from the 1750 level 1,200 tons of ore of the assay value of \$21.10 per ton.

CON. IMPERIAL.—The east crosscut, 250 ft south of the north winze, 2810 level, is 13 ft 3 in, the face in hard porphyry crossed by small stringers of quartz.

OVERMAN.—Winze has been sunk and timbered 25 ft; total depth, 236 ft below 1900 level; rock harder, but blasts well. Incline upraise has been extended and timbered 27 ft, and is still in hard, dark porphyry.

OPHIR.—On the 2000 level the joint California winze has been sunk and timbered 14 ft. On the 2300 level the joint California upraise has been extended 15 ft. On the 2500 level we are engaged in cutting out a chamber for the joint Mexican winze.

SAYLOR.—During the week the shaft force was engaged in main shaft repairs as usual. The incline force was engaged in repairing head of incline and the drift force continued the driving of the 10th level drift.

MEXICAN.—On the 1600 level we are repairing the north lateral drift. On the 2500 level we are cutting down the grade in the main north lateral drift; also, are cutting out a chamber for the joint Ophir winze.

CALIFORNIA.—Ramps have been run on an average of 18½ hours per day, consuming 7.37 cords of wood per day.

UNION SHAFT.—Cleaning out the bottom of the shaft preparatory to sinking, and raising the south compartment from the 450, 900, 1300 and 1900 stations.

HALE & NORCROSS.—Repairing the 2100 level and cutting down the south drift on the 2400 level. The incline is being cleaned out.

BALCONIA.—The pump has been started up, and everything in and about the mine is progressing satisfactorily.

BRISTOL DISTRICT.

HILLSIDE.—Pioche *Record*, Oct. 10: The Hillside furnace is still doing good work, and prospects of a long and successful run, as the mines are now looking well and ore of a good grade are coming in fast.

LAUREL.—The "Laura O." mine, which has been lying dormant the past few months, has been leased to parties who will recommence operations this ensuing month.

THE NEW WELL at the mill of the Bristol S. M. Co. is down 70 ft, with 3 shifts on, making from 3 to 4 ft per day.

THE MENDOTA and Bay State mines are in particular looking well this past week, and shipping some fine-looking ore to the furnace.

THE HILLSIDE refinery, upon the completion of the new cupel furnace, started up some days ago and is running well.

EL DORADO DISTRICT.

FOR EL DORADO.—Pioche *Record*, Oct. 10: Quite a number of Piochers and Bristolians have lately departed for El Dorado canyon. They all think that it is the coming boom of Lincoln county, and we hope that they will not be disappointed.

EUREKA DISTRICT.

NEGOTIATING.—Eureka *Sentinel*, Oct. 16: It is reported that a New York company is negotiating for the purchase of a very valuable mining property in this district. The property has yielded handsomely in former times, but has been lying idle for some time.

THE OWNERS of the Sagebrush and Welsh King series of mines have commenced work, and from the previous reputation of the property, \$70,000 having been taken from it, they will soon be taking out ore.

OSBORNE K. McCULLOCK has been doing the assessment work on the Reeves & Berry mine, in Spring Valley district. One man is now taking out an average of \$200 per day.

MIRY MICHIGAN is taking out a large quantity of flux from the north and south end of the mine. He is also taking out some chloride ore that assays near \$500 per ton. He is working the mine under lease.

H. C. KIRKPATRICK is taking out rich ore from the Mountain Boy series of mines, which he has under lease. The Mountain Boy is a good property.

MOUNTAIN VIEW.—Upon the eastern slope of Secret canyon is situated the above-named mine, owned by Pat Dwyer and Eugene Dwyer. The mine has been leased to Bertrand furnace was running out metal. This mine furnished a large amount of ore, and the rock therefrom was only used as a flux. Its prospects are even better now, and the company contemplate running a tunnel to tap the Ruby Hill ore channel, which is certainly upon this ground. Many tons of good ore were taken from the old shaft at one time, and only the low grade was used for fluxing purposes. A new shaft has been put down 40 ft recently, and has run into ore of a medium grade. The projected tunnel will strike the ore channel at a depth of about 600 ft. Present indications on this property are very encouraging.

ESMERALDA DISTRICT.

REAL DEL MONTE.—Herald, Oct. 16: A station has been cut on the 800 level and the diamond drill started to work. The shaft is now clear and sinking has been resumed.

HICO DISTRICT.

SILVER SANDSTONE.—Pioche *Record*, Oct. 16: On Saturday last Henry Raymond returned from a visit of inspection around Hiko. In addition to a lot of fine specimens from the Green Monster and other mines near Silver canyon, he brought with him a specimen of sandstone, of similar character as that at Silver Reef, and had it assayed, and it went \$63 per ton. Mr. Raymond says there is a large body of this sandstone ore in the rear of the Green Monster mine; he cannot say that it is a mine, but it is an immense deposit that could be utilized to produce silver if a mill was in operation anywhere near that place. Mr. Raymond thinks that Hiko and vicinity will be doing well before long.

INDIAN DISTRICT.

THE MOONLIGHT MINE.—Silver *State*, Oct. 16: The Moonlight mine, in Indian district, some 6 miles south of Unionville, has, we are informed, been purchased by a San Francisco company, and work will be commenced forthwith. In early days the Moonlight was one of the prominent mines of the county, and sold readily at from \$30 to \$40 per ft. Considerable ore from the mine was hauled to Unionville and worked in the Pioneer mill, with good results. It was purchased years ago by a San Francisco gentleman named Ashby, who obtained a United States patent for it, and let it remain as it was the day he bought it. We hope he has sold it, and that the new owners will develop it as it deserves. It is to be one of the best mines ever discovered in the county. J. M. Brown, who had charge of the Pioneer mill while it was run on Moonlight ore, says it worked about \$100 to the ton, and a lot of the best ore, which was shipped to San Francisco, worked about \$4,000 to the ton.

PIOCHE DISTRICT.

BULLYHOOP.—Pioche *Record*, Oct. 16: Work is being pushed on the reduction works at Bulllyhoop. The stone warehouse is about completed. Oodbe & Hampton have purchased the Magnet tailings from John P. Kelley. These tailings are very high, assaying \$25 per ton. There are between 8,000 and 10,000 tons, and \$5,000 was the price of them—a very low price. Mr. Montgomery will work the Bulllyhoop tailings, and will also take charge of the firm's reduction works in that city, and Ben Hampton will take charge of the works at Bulllyhoop.

ARIZONA.

OUROS.—Chronicle, Oct. 10: The Southwest Alice lode and mine property is located about 1 mile north of Globe City, and as its name designates, is the southwest extension of the Alice mine. The main shaft is now at a depth of 100 ft and well timbered. Returns from the Isabella mill, where there was worked 33 tons, taken from here, unassorted, give the following results: 12 tons, net yield, \$196 per ton; 12 tons, 164 ounces; 14 tons, 162 ounces.

CENTENNIAL.—Eighteen men are at work under the supervision of W. B. Hellings and 10 more at work on the

Haskins road. Mr. H. claims that with their own teams the company can haul over this road to their mill site for \$2 per ton. The mine is looking splendidly, some ore taken out yesterday going over \$1,000, and all of it assayed over \$200. We found on the dump which has been assayed \$82. It is the intention of Sept. H. Hellings to mill everything between walls, and throw away nothing. The vein is from 3 to 5 ft in width.

MINERAL CREEK.—The mill frame is now up and pans, engine and boiler in place, and work being pushed to completion as rapidly as possible. At the mine a tunnel on the vein in 190 ft and will connect with the shaft at a depth of 100 ft. A tunnel has been started from bottom of shaft to meet the tunnel.

SILVER MOUNT.—The property is now in good shape for extracting ore and the mill will start up about the 20th.

MINISO NOTES.—The Lost mine, 6 miles north of Globe, now owned by Con. Burns, is attracting attention again on account of a recently reported rich strike. Thousands of dollars have been taken from this property, with very little outlay for work, and the extent of value of the ledge is not yet known. The claim was located in November, 1875, by Kentuck, under his name, and then sold for \$3,000.

SADDLE MOUNTAIN DISTRICT. 60 miles south of Globe, was organized last May and numbers now about 100 locations. The country here is described as unprospected. The formation is granite and granite, milling ore said to resemble Tombstone rock. Patterson & Woodson, Tucson, are working a number of claims, and Mr. G. E. Reed, to whom we are indebted for these notes, is opening some promising prospects. A good road will soon be completed through this camp, and Globe will get the local business which now goes to Florence.

SILVER DISTRICT.—*Territorial Examiner*, Oct. 15: Very fortunately for the district the purchasers of the wonderful silent mine have proven to be men who appreciated the immense value of that large deposit, which fact is evinced by the departure to-day of a special steamer from Yuma for Silver district, loaded with the engine, water-jackets and all the paraphernalia requisite for a first-class smelting furnace, with a capacity of 25 tons per day. The grading for a mill site at Norton's landing, owing to a force of 15 men being put on, is about completed. The contracts awarded are to Jesus Contreras, for hauling 25 tons of ore to the furnace from the mine, a distance of 5 miles, down grade, was for \$2 per ton; 75 cords of wood per month at the furnace to Joe Redonde at \$3.50 per cord; charcoal, 20,000 bushels per month, at the furnace, 15 cents per bushel. These people cannot be too highly commended for their energetic vim and thorough business tact, in endeavoring to place their property, at the earliest moment, on a self-supporting and dividend paying basis, which position it will occupy after the first run through the furnaces. One shipment was taken out, sent to San Francisco and the furnace immediately ordered, on the strength of that shipment. Mr. Cooker will make all necessary arrangements for the continued working of the mine, and the success of the last lode is among the most valuable in the camp, and I will have more to say anon.

Messrs. Dunbar & Sprinkle, of Oakland, are visiting our camp, for the purpose of securing and working property here. We have plenty of room for just such parties. The owners of the Gracie, a lode lying between the Clara and No. Name ledges, East Silver district, will be down from California in a few days and develop that lode.

TOYTO BASIN.—Mr. Francis, of the House & House mine, informs us that the mining interests of Toyto Basin are looking splendid. He also states that he expects the House & House mine, owned by himself and Mr. House, will be sold by the time he returns, which will be in a few days, as a telegram to that effect had been received in Globe. The Siebert property, which includes 16 mines, instead of being sold, as previously reported, was bonded to Siebert for \$500,000, the bond to expire on the 1st of the coming January. The company pay a forfeit, the exact amount we did not learn. Mr. House tells us that placer mines have been discovered in that section. In places very rich, yielding as high as \$1 to the pan of dirt. The gold is quite coarse, but the trouble is water, which is scarce at this season of the year.

PIONEER DISTRICT.—Pinal *Drift*, Oct. 9: Mr. Champion, of the Lewis Creek mine, for the past week. The tunnel is now in 140 ft. They are going down in the winze. Have good ore, chiefly galena and quartz, and get 100 barrels of water every 24 hours, which is disposed of easily. They are also cross-cutting in the tunnel.

MINERAL HILL ITEMS.—A correspondent sends us the following from Mineral Hill: I thought I would give you the result of our assessment work on the Baby mine and on the Rough & Ready. The Baby mine paid a 10 ft shaft; the pay streak is 2½ ft wide at the bottom of the shaft. Assays \$825 per ton in silver. On the Rough & Ready we sunk on the ledge 14 ft. Struck good pay ore, which assayed \$355.44 gold per ton. Both are owned by Henry & Hanlon and Schosbush of Florence. Henry & Hanlon will commence putting up 2 arastras in Box canyon this week to work the Shakespeare gold ore. The Mineral Hill mine are about 10 miles from Pinal in a southwesterly direction, on the new road by way of Seven Cottonwoods. They are within easy reach of both Florence and Pinal.

MINES BONDED.—D. M. Hyde has bonded to Peter Carter, Esq., of London, England, the following mines, situated on the grand belt between the Silver King and the Webster, for the amount of \$100,000. The Hyde, adjoining the Baltimore, \$15,000; Tornado, \$25,000; Solferino, \$25,000; Silver Coin, \$20,000. These are all excellently located, and are most promising prospects. They are, we are assured, as good as sold, and likely to draw into our district a large amount of English capital. Miners are busy at work all around us. We are assured that the mines of Queen creek—the Lewis, Gem and the Surpriser and several others, are looking better than ever.

COLORADO.

STARTED UP.—Colorado *Miner*, Oct. 9: The Farwell reduction works, which have been lying idle some time, on account of the breaking of the dam at Devil's Canyon, started up last Wednesday. They have over 200 tons of ore on hand, and are ready to buy more at all times, and promise to pay the best prices.

TENTH LEGION.—This lode is situated on Silver mountain, near Empire. The owners, Messrs. B. O. Russell & Co., have consolidated all the old ground and the extension and will commence operations at once. A new engine and boiler will soon be put in place.

SNOWY RANGE LODE.—This lode is situated in Atlantic district, and is being developed under contract, and shows a vein 5 ft in width, 12 inches of which carry silver galena and chloride ores, which assay from 100 to 300 ounces.

FENTON MINE.—This mine is situated on Brown mountain, and is being developed under contract, and shows a vein 5 ft in width, 12 inches of which carry silver galena and chloride ores, which assay from 100 to 300 ounces.

THE UNION TUNNEL.—The owners of this property are at present engaged in cutting out an engine chamber 30x60 ft, at the head of the Union tunnel, over the main shaft. An engine and boiler will soon be placed in position. When completed this will greatly facilitate the development of the lower workings.

NO. 5 LODE.—George Anderson & Co., who are stopping on the north streak above the tunnel level, have it rich. Their pay streak will average from 6 to 18 inches. They had a mill run last Saturday with the following result: First class, 465 ounces; second class, 235; and third class, 175 ounces silver per ton.

THE GEORGE PATRICK.—This lode is located on the Columbia mountain, in Hotchkiss mining district, on the Columbia belt as the Kollinor and Joe Reynolds. There is excellent timber and water in close proximity to the lode. The developments thus far consist of a main shaft sunk 50 ft on the lode. East of this about 100 ft is shaft No. 2, which is 10 ft deep and shows gray copper and some galena. The owners have just closed a contract to sink the shaft 50 ft further.

IDAHO.

YANKEE FORK ITEMS.—Herald, Oct. 12: Twenty tons of Summit ore, reduced in Morley's arastra, yielded nearly \$1,000, or about \$200 per ton. The quartz now shows a good deal of free gold. The mine is being worked day and night. John McVicker, the Salt Lake assayer, made an assay last week of the soft black sulphur ore lately struck in the Vienna mine, at Saw Tooth, and found it contained 2,625 ounces silver, and \$33 16 in gold. George Simpson returned Wednesday evening from a trip to the Wood and Lost River camps. He reports that Tom Covert, Al. Kyle and others have struck a new mineral belt between the Big and Little Smoky. The ledges are from 2 to 5 ft thick, well defined and contain rich carbonate and galena ore. The parties in from Wood River report developments going on briskly and the mines looking well. There are now about a dozen camps in the new carbonate field, and the smelting ore already in sight guarantees a bright future for that section of our Territory. The Bay Horse concentrating works are shipping large quantities of base bullion to the Omaha refining works. It is worth on an average about \$1,000 per ton. Another belt of quartz ledges was struck a few days ago between the Pansimari and Little Lost river. It gives promise of a good camp. It is reported that the Annie, on Mount Custer, has been purchased by the parties who lately bought the Lucky Boy, in the same vicinity. The lower belt on the Charles Dickens is in over 500 ft, all that distance on good ore. The mine never looked as well as it does at present.

MONTANA.

HELENA ITEMS.—Cor. Butte *Miner*, Oct. 12: Prospect ing for iron mines has been followed lately to a considerable extent in this vicinity. The Alta Montana company has contracted for and has now in course of transit 200 tons of iron ore taken from a mine situated on Dry gulch, a couple of miles above this city, owned by Messrs. Geo. Cleveland, Smith & Co. The ore is used at Wilkes as a flux for operating their silver ore. Mr. H. W. Curran has recently struck a huge vein of iron ore near Unionville, which carries about 75% of iron, besides a fair amount of gold. Mr. Curran has contracted to deliver 100 tons of the ore at Wilkes. Iron mining will soon become an important factor in our prosperity. A very large body of old-riding ore was discovered a few days ago near Park City, by Messrs. Springer & Constans. They have recently across the ledge for a distance of 10 ft without reaching the hanging wall. The vein promises to be a leviathan in size. Several tons of unassorted ore were crushed which yielded \$13 per ton. Considering the vast width of the lode, this yield may be put down as very flattering for the owners. Capt. Talon, who is in charge of the Park mine, is still busy at work sinking on the same. The Kennedy mine, at the Park, is at present lying idle. It will remain he worked as soon as some new machinery arrives. Capt. Spragins, of the Black Alder mine, near Unionville, has spent nearly the whole season in driving the tunnel to tap the monster vein. The Captain expects to be soon taking out ore.

NEW GOLD DISCOVERY.—Helena *Independent*, Oct. 14: We learn through Messrs. T. C. Power and J. H. McKnight that new placer and gold discoveries have recently been made in Meagher county about 5 or 6 miles from Fort Maguin. The new mines are located in what is called Maiden gulch. The gentlemen named had some gold from the new diggings which assayed nearly 900 fine. The extent of the mines, either as to the quartz or placers, is not yet known, but the discovery gives promise of being an important one.

NEW MEXICO.

THE CLIFTON PLACERS.—Herald and Southwest, Oct. 16: We mentioned last week that arrangements had been perfected for the consolidation of interests in the Clifton placers, and the commencement of operations upon an extensive scale. The claims are situated upon the Fresno, commencing at or near Steven's ranch, about 2½ miles above Clifton, and extending up the river about 4 miles. Gold is to be found in the gravel deposits of the lower part of the river, but the ground located lies principally on the west bank, and extends back, at places, for a distance of fully 3 miles. The deposits of gravel are simply enormous. On the Montezuma Bar, which is a 20-acre claim, it varies from 125 ft to 150 ft in thickness, and it is claimed that in places the bedrock cannot be reached even at the latter depth. This discovery shows an enormous prospect of about \$2 to the cubic yard, and is a somewhat remarkable as well as favorable feature that from nearly every portion the returns are in coarse shot gold. Enough work has been done here to cover about 4½ years' assessment. Other claims show up equally well. Five of the locations are in quarter sections, and every part of the ground gives good returns, the prospects varying from 0 to 45 lbs. to the pan. The pan. The Fresno Placer & Co., and others have made extensive developments, and the work has been so wisely directed that the richness and extent of these placers is patent even to the unskilled observer. There is every facility for operating by hydraulic process, and in the hands of a company sufficiently strong to introduce improved appliances and work by latest methods, the Clifton placers will doubtless prove to be one of the richest homanzas on the continent.

UTAH.

ALTA.—Cor. Salt Lake *Tribune*, Oct. 16: The City Rock is putting up new and commodious buildings, both at the main and lower tunnels. The Vallejo has been building extensively, and the Victoria and Imperial is putting up a new building on the site of the old one. The one owned by Or. Kates, and situated near the Evergreen hill, both have put up houses preparatory to the winter's work. Rumor has it that some 8 or 10 claims in the vicinity of Orizly Flat are in the hands of a New York syndicate and that work will be commenced upon them in a few days. The objective point at first will be the Snow Storm, joining the Utah on the west. There will then be the first strike of silver on the claim on the City Rock ledge. Who says we have no true veins in Cottonwood? The Lavina is being worked on lease. The lessees are taking out 100-ounce ore from near the 300 station of the main shaft. The Evergreen has lately made quite a large shipment of carbonate ore. This surprises the oldest inhabitant. The City Rock has 1,000 sacks of ore on the dump taken from the old workings on the discovery tunnel. It represents the labor of one man for 30 days.

BINGHAM.—The Nellie mining company own a group of mines at the head of Dry Fork. As yet this company is only in its infancy and developments have not been made on a very large scale. The ore carries a large percentage of gold and is free milling. The vein is well defined, and new pits are 25 ft thick, and the ore is very rich. The Kates, and situated near the Evergreen hill, both have put up houses preparatory to the winter's work. Rumor has it that some 8 or 10 claims in the vicinity of Orizly Flat are in the hands of a New York syndicate and that work will be commenced upon them in a few days. The objective point at first will be the Snow Storm, joining the Utah on the west. There will then be the first strike of silver on the claim on the City Rock ledge. Who says we have no true veins in Cottonwood? The Lavina is being worked on lease. The lessees are taking out 100-ounce ore from near the 300 station of the main shaft. The Evergreen has lately made quite a large shipment of carbonate ore. This surprises the oldest inhabitant. The City Rock has 1,000 sacks of ore on the dump taken from the old workings on the discovery tunnel. It represents the labor of one man for 30 days.

THE CARRIE STRIKE.—Salt Lake *Tribune*, Oct. 16: Specimens have been sent to the Tribune cabinet from the Carrie mine, Honeycomb Fork, Big Cottonwood, which assays 19½ copper, \$3,076 silver, and \$12 16 gold per ton. There is a very important strike to those interested, of course, and also the owners of property in that vicinity. The first west extension of the Telegraph, Bingham, has a larger ore body than ever. Hoisting works are to be erected this fall. The break in the Emma pump has been repaired and everything is now running smoothly. A great many miners are coming to the city, from the northern camp, to spend the winter.

Tall Panic Grass or Switch Grass.

We give on this page an engraving of a grass which will be recognized by many of our readers who hail from the prairie States, as it forms one of the leading factors in prairie pastures, especially in the low moist localities. It is one of the large family of "panic grasses", and specifically is *Panicum virgatum*, and is usually called "switch grass" by the farmer. It is a tall perennial grass, from three to five ft. high, and growing mostly in clumps or bunches. It is a good pasture grass and is relished by stock. It also makes good palatable hay when cut young, but it speedily becomes woody if left too long.

The analysis of the composition of tall panic grass, as made by the chemist of the Agricultural department at Washington, shows that it is not of very high nutritive value as compared with many other grasses. In our last note upon a pasture grass we instanced the difference in chemical composition between *Sorghum Halapense* and *Sorghum nutans*, two grasses of the same genus, showing the great superiority of the former. A similar variation in quality exists among the panic grasses. It may be seen by comparing the crab grass (*Panicum sanguinale*), which we lately illustrated with the one which we present this week, as follows, taking account only of matter acknowledged to be nutritive:

	Crab Grass.	Switch Grass.
Oil.....	2.87	1.75
Sugars.....	9.83	9.61
Albumenoids.....	9.89	4.52

The deficiency in albumenoids or flesh-forming materials is quite noticeable. However, although the analysis of a grass is one element in its value, there are many points of habit of growth, adaptation to peculiar situations, amount of yield, etc., etc., which must always be taken into account when judging a foreign plant.

Mining Around Benton.

Benton cannot rub her hands very gleefully over her late past and present mining outlook. Mining in the different districts around the camp has been and is apathetic. Mines cannot be worked without capital, and capital is possessed of a most nervous temperament. Gives capital assurance that it will be protected, and that its cent per cent will be prompt on collection day and capital is a liberal dealer. But lead capital to suspect that you think you know better how to handle it than it knows how to handle itself, and Mr. Capital straightway buttons up his pocket and retires to his hole. We know that capital wants to come into Benton, where it is needed, but capital feels that under the New Constitution and the laws sought to be enacted under it, there is no protection for capital here. For a year past Bodie has been steadily declining in its mining industry. No sensible practical miner for a moment believes that this is attributable to a diminution of mineral wealth in that camp. It is due solely to the timidity of capital in its present unprotected state. And we venture the assertion that, if the truth were and could be known, the reason why large numbers of workmen have been discharged from the mills and mines of Bodie district is not because there is not a vast amount of work there absolutely necessary to be done, but probably because the mine and mill managers have received private instructions from their moneyed superiors to work everything to its very lowest capacity until such a time as capital can see its way out of the lethargy by which unwise legislation has prostrated its energies. In view of the depressed condition of the mining interests the election of our next legislators becomes a matter paramount to all other considerations. No political prejudices should influence the miner or any man depending on the mining interests for his business in casting his vote for members of the next legislature. The mining counties should unite in sending a cordon of practical miners to Sacramento possessed of enough intelligence and energy to command the respect of their fellow members to influence and enforce needed legislation.—*Bentonian*.

PELICAN-DIVES.—For months past the owners of this famous property have been to work placing it in such shape that the immense bodies of mineral existing in the lower workings could be reached. Accordingly an engine chamber 40 ft. long, 30 ft. wide and 25 ft. high, has been excavated at the fifth level of the Perdue shaft, and an engine and two boilers will soon be in place. When this is accomplished the Perdue shaft, which is 600 ft., will be continued down, and new levels run. The fifth level has been timbered throughout. Such work as this has long been needed, and the owners realize the success that is bound to attend their efforts.—*Colorado Miner*.

MR. BURCHARD, Superintendent of the Mint, is of the opinion that the product of gold and silver in this country for 1880-81 will amount to \$60,000,000—of gold \$36,000,000, and of silver, \$24,000,000. This is a total of nearly \$86,500,000 less than 1877-78.

BIG CONTRACT.—The *Carson Tribune* says: Polson & Marlette have a contract with the Sierra Nevada Wood, Lumber and Flume Company to cut and deliver at their flume 40,000 cords of four-ft. wood at \$2.40 a cord, to be cut on the company's land at Cornelian bay, Lake Tahoe.

Agricultural Machinery for Mexico.

There has lately been published in Mexico a report to the Mexican Agricultural Society by a planter, who has been introducing new American agricultural machinery and superseding the old styles and means of tillage. The old style was based upon the ancient Egyptian plow drawn by oxen; the threshing was done by trampling out with animals. In order to accomplish even a small amount of plowing a large gang of laborers has to be supported, and there are large numbers of horses which have to be fed the year through, chiefly because of this labor they do in treading out the grain. Both these items of support for laborers and animals are heavy upon the farmer, and it seems a plain enough proposition that he must have means for doing much more work in the same space of time if his enterprise is to be very profitable.

chinery manufactured in the United States in preference to those of European manufacture, not only on account of the saving of time in their transportation and at less expense, but also because I consider that the people of North America have devoted more attention to the cultivation of the soil by machinery, and are at the present time producing the largest crops of grain at the lowest possible cost. From what I have seen, European agricultural implements are more solid, better made, more highly finished and constructed of better materials than the North American; but, on the other hand, if they are not more expensive, they are generally so cumbersome and heavy that our animals and our workmen cannot handle them as well.

It was found that the common laborers soon learned to operate the improved machines, although there was naturally some objection to their introduction by the laboring class, who were dispossessed of the chance to pursue the old system which called for their peculiar services and gave more of them employment. The advantages of the new system has, however, become so apparent to the farmers that there is quite a disposition among them to follow the example set by the man whose experience we are

TALL PANIC GRASS—*Panicum Virgatum*.

The matter of time for certain operations as it exists in some parts of Mexico is interesting and somewhat unlike anything in this State. The report of the Mexican experimenter to which we have alluded, describes local conditions in the district of Huejotzingo, as follows:

In this climate the land soon becomes dry and hard, and the season for planting soon passes away. Consequently planters were required to reduce their acreage of cultivation or increase their stock, in order to make the most of the planting season. Planting was done by the Egyptian plow, which, with the shallow furrows, although producing favorable results, did comparatively little work in a day. This moisture in the lands in this elevated portion of the country, quickly evaporates, and the planter, if it does not rain, or if he cannot irrigate his land, is compelled to suspend sowing, losing his previous preparation of the soil from the result of the slow operations, in practice in matters naturally requiring rapidity of action.

To free his operations from this embarrassment of slow work in a short working season, this enterprising Mexican resolved to introduce the best agricultural machinery from the United States, and the reasons he gives for choosing our machinery are well worth quoting, as showing a foreigner's opinion of the relative qualities of American and English machinery. In his report he says:

My attention was directed to the implements and ma-

citing. The contrast in methods and expense of the two systems is outlined as follows:

Plowing generally begins in the early part of July and terminates on the 4th of October. The first plowing is intended to turn over the soil, so that the moisture may disintegrate it; the second is crosswise, so that the ground may be well stirred, and the third leaves it clean, level and loose to receive the seeds. Under the old system, these three plowings had to be performed during the three months of July, August and September, to enable us to begin covering the seed early in October. Under the new system, the first two plowings can be done in the three months stated, and the last can be commenced a few days only before planting time, which operation can be performed in October and up to the middle of November. The result is that the plowing can be done with two-thirds of the stock, plows and hands formerly required; and as a greater interval elapses between the three plowings, the land receives a greater benefit. The rains start the weeds to growing; they have a longer time to grow, and on being turned under they have more time to decompose, thereby furnishing a green fertilizer to restore the waste of the land. I commenced using this turning plow at the second plowing. It opened a furrow from 10 to 12 inches in depth, and one-half yard in width. Three mules and a hand worked it, and left the ground well pulverized, free from weeds, and so prepared that the natural moisture was retained for a longer period, and the land perfectly clean. In the last five years the three plowings on this plantation cost on an average \$1,595 annually. This year they only cost \$1,211. The result is a saving of \$384 in money. The quantity of stock and number of laborers was reduced to one-third, and we have one-third more time to do the work in.

A Montana Enterprise.

The Butts (Montana) *Miner*, says: It is reported on reliable authority that arrangements are almost completed between Mr. W. A. Clark, owner of the Frank Moulton mine, which adjoins the Alice on the west, and a Salt Lake company for the transfer of a one-half interest in that noted property. The stipulation, it is understood, is to the effect that in consideration of a deed to one-half of the mine the purchasing parties will import hoisting machinery and Cornish pumps necessary to sink a shaft to a depth of 800 ft. and that they will erect without unnecessary delay a forty stamp dry-crushing mill with chloridizing furnaces, six 81-horse power boilers, 300-horse power engine, and other machinery of the most improved and durable pattern, embracing a total expenditure of \$250,000. Negotiations are not yet fully concluded, but there is little doubt that the project will be shortly consummated. It is believed that the mining machinery will be on the ground this fall, as in all probability it will be ordered next week, and that the construction of the mill will be begun next spring, on the opening of freight communication.

Of the permanence, richness and extent of the Moulton mine there can be no doubt. Located indisputably on the Rainbow lode, it has virtually been developed by the Alice shaft to a depth of 700 ft., and as the Alice vein has greatly improved in richness in the west levels, it is reasonable to suppose that the improvement continues into the adjoining property, the Moulton. This being the case the wisdom of opening up the Moulton on a large scale will be at once conceded, for not only may its development be depended upon to result in immense advantage to the owners, but it will be of immediate benefit to the camp, and will materially aid in bringing about the great silver mining era of Montana which may be confidently looked for as a natural consequence of the intelligent investment of capital.

Work Your Mines.

For some time past the Leadville *Circular* has persistently urged miners to cease their efforts to sell their mines, and work them for pay instead.

That this advice has been heeded to some extent, is shown by the increased output of that camp in August and September, notwithstanding the Chrysolite product has diminished one-half, and that of the Little Chief falls to merely nominal figures. In July the entire output of Leadville was estimated at \$1,050,000, in August \$1,250,000, and in September \$1,290,000. These figures indicate what a score of small mines can do if earnestly worked, in case of failure or diminished output of two or three large ones.

Individual labor and enterprise must precede and pave the way for capital in all mining districts, and now-a-days nothing will so inspire capital with confidence in the value of a mine as actual production, and sales of the product, whether it be 1,000 lbs. or 10 tons daily. Admitting the truth of the above, let owners who wish to sell properties that have pay ore in sight take that ore out and sell it, and armed with mill certificates—the only trustworthy proofs of value—they need not wait for buyers. If, on the other hand, they wish to retain and work their mines, is it not better to make available the output of ore, be it little or much, by applying its proceeds in cash to farther development, instead of drawing upon other resources to cover all the cost.—*Silver Cliff Prospect*.

Low Grade Ores.

The Boulder county, Colorado, *Herald*, contains a long article in praise of the practical workings of what is known as the Rouse concentrators, a description of which is too long for publication in these columns. From this cotemporary it appears that Mr. A. J. Van Deren, who discovered the John Jay mine at the mining camp of Providence, in Boulder county, has been testing low-grade ores from that mine by the Rouse process, with the following result: "Mr. A. J. Van Deren, proprietor of the John Jay mine, bought two of the tables, and began to work his thrice assorted dump pile and lowest grade ore from the mine. The result of the concentrate so astonished him that he could not believe all was right. Finally another was made. The dump pile, which had been picked over as many as four times and all good ore taken out, as was supposed, was crushed under the stamps. For nine hours, C. P. Wood, on the part of the company, and J. M. Van Deren, on the part of the John Jay mine, took samples alternately, every five minutes, and then had these samples assayed. The report of the assayer was \$14.45, which was low grade indeed. This ore was then run over the tables and 12 2-5 tons run into one. The concentrate was then sold at \$154.89, the machinery saving 86% of the assay value of the ore."

A NEW DISCOVERY.—Some very important discoveries of silver ore have recently been made about 12 miles east of Bodie, or six miles east of the Spring District mines. The ledge are large, strong and well defined, and the ore runs to silver. The quartz is less agatized than that of the Spring district—less so than on the eastern slope of Bodie bluff. Some San Francisco mining men of experience, who have become interested in the new district, are highly pleased with the prospect.—*Bodie News*.

THE ENGINEER.

An Underground Railway for New York.

There is now a definite prospect that within two or three years rapid transit trips will be made from South ferry to Central Park through a tunnel under Broadway. The certificate of incorporation of "the New York Underground Railroad Co." has been filed in the County Clerk's office and the plans for the road are completed. It is promised that the contracts for construction will be awarded within a fortnight and that by October, or perhaps November, the actual work of excavating will begin. This new company will be the successor of "The New York City Central Underground Railway Co.," which was specially chartered by the Legislature of 1868 and amended May 11, 1869. It is said that Gen. McClellan will be the president of the company, and that arrangements have been made in Europe for placing the heads of the company on favorable terms. The details of the financial arrangements cannot be learned until after the officers of the company have been chosen and the terms of the transfer of the franchise have been settled. The company expect that the road will be completed on or before June 1, 1883, so that it will be in operation by the time the World's fair is opened in 1883.

The road will extend from South ferry along the eastern side of the Battery to Broadway and Bowling Green and thence up Broadway, under Union square, to Madison square. The main line will continue from this point under Madison square and through Madison avenue to Forty-second St. Beyond this point the plans of the company do not at present look. But at Madison square a branch road will run on under Broadway to Fifty-ninth St. and Eighth avenue. Stations are at the Battery, Wall St., City Hall, Leonard St., Prince St., Astor place, Union square and Madison square; others on the Madison avenue line at Thirty-fourth and Forty-second Sts., and on the Broadway line at Thirty-fourth, Forty-second and Fifty-ninth Sts. are provided for.

The road will be built with two single-track tunnels, each 15 ft. high and 12 ft. 6 inches wide, which will run side by side, and separated by a brick wall. They will lie directly under the middle of Broadway, just below the water pipes. The tunneling will be done from a side street.

The tunnels will, as a rule, follow closely the surface grade of the streets, and the tracks will be at an average of 25 ft. underground. On Murray Hill, at Thirty-eighth street, however, the pavement will be 62 ft. above the tracks in the tunnels.

One of the chief advantages claimed for the tunnel will be its dryness. Built of brick and cement and with a hard white finish, the walls on all sides will be covered with asphalt. This will, it is expected, render the tunnel impervious to water, and the system of ventilation proposed is relied upon to prevent any dampness. Large 60-ton locomotives will be used. They will burn coke and consume their own smoke. The exhaust steam will be condensed, and nothing will escape to vitiate the atmosphere of the tunnel but a little gas. It is proposed to light them, as well as the tunnel itself, with electricity. An electric machine will be placed on each engine to run the headlight and the candles in the cars.

The problem of thorough ventilation has been considered carefully, and it is believed by the engineers that it has been solved. At the principal stations air shafts will rise up 75 ft., and other openings will be made at frequent intervals. Through these air will be introduced by artificial means.

The underground stations will, as a rule, be under street corners, and will be entered through the business blocks or other buildings there. Trains of from 8 to 10 cars can be run at a speed, it is estimated, of 25 miles an hour, including stops, and from 800 to 1,000 passengers will be able to find seats in each train. Trains can be run as frequently as every 3 minutes if necessary. The fare will be uniformly 5 cents. In the route up Broadway the old tunnel at Murray street will be passed by as of no use and no connection will be opened into it.

It is proposed in the future to extend the road from Madison avenue and Harlem either by further tunneling or by connection with the present tracks of the Harlem railroad through the open cut in Fourth avenue.

THE RUSSIAN RAILWAY SYSTEM.—The Russian railways are owned by the government. They have been built for the most part for strategic purposes, and without any regard to their use by the commercial or traveling public. Hence it happens, according to a late report by the British Consul-general Stanley, that in Russia, the railways are so many through lines, with no branch lines connecting with them. As an illustration he instances two lines which run parallel to each other for nearly 500 miles, and have not a single transverse line connecting with them for the whole of the distance. The result is that to get from one town to another, almost in the same latitude, the traveler has to take a long journey north by the one line and then return south by the other, so that to get to two towns only 350 miles apart, it is necessary to make a railway journey up one line and down another of 750 miles.

USEFUL INFORMATION.

How to Select and Take Care of a Watch.

This following advice may prove serviceable to those who have to rely on their own unassisted judgment in selecting a watch: 1. While adhering to taste and elegance, choose a watch thick enough. In a watch too thin or too little, the parts are too feeble, and have not sufficient space to work well. Watches as large as a penny piece, or those that are about as thin as a fourpenny piece, are mere experiments of skill, which should rather be regarded as masterpieces of patience, from which there is more vanity than utility to be derived. 2. Avoid in watches that construction which fashion has often prescribed, but which good sense condemns—such as those that point the days of the month, and so forth. Those extra pieces necessitate additional parts, which occasion friction, and encumber a space already too limited; though here it may be observed that complicated watches, such as chronographs, repeaters, etc., are now brought to a high state of perfection, at, of course, a correspondingly high cost. 3. Do not allow yourself to be attracted by the supposed advantages of new escapements. In watches for ordinary purposes, the lever and the horizontal escapements are generally adopted, as giving the best results. 4. The watchmaker who is conscientious will point out to you the limits beyond which a watch ceases to have the qualities necessary to go well. A watch procured for the design of its case may be covered or set with chasing and gems; it is then simply a jewel; but that which is bought for its utility ought to be as plain as possible, and this plainness itself is, as a rule, a distinguishing characteristic of its good quality.

We will now say a few words as to what we ought to do, and what we ought to avoid, to preserve a watch in good condition. Having obtained a really serviceable article, you should, in order to produce satisfactory results, follow out these rules: Wind up your watch every day at the same hour. This is generally done at the hour we retire to rest; or, perhaps, better still, at the hour we rise. Avoid putting a watch on a marble slab or near anything excessively cold. The sudden transition from heat to cold contracting the metal, may sometimes cause the mainspring to break. Indeed, the cold coagulates the oil, and the wheel work and pivots working less freely, affects the regularity of the timekeeper. When we lay our watch aside, we ought to slope it on a watchcase, so as to keep it nearly in the same position as it has in the pocket. In laying aside your watch, be sure that it rests on its case, as by suspending it free, the action of the balance may cause oscillation, which may considerably interfere with its going. If you would keep your watch clean, you must be quite sure that the case fits firmly, and never put it in any pocket but one made of leather. Those pockets which are lined with cloth, cotton or calico give, by the constant friction, a certain quantity of dust, which enters most watches, even those the cases of which shut firmly. If the watch is a "keyless" one, the key should be small, in order that we may feel the resistance of the stop-work; then we can stop in time without forcing anything. It is also necessary that the square of the key should correspond with that of the watch. If it be too large, it may in a short time cause the wind-up square to suffer from undue wear and tear, the rectifying of which is rather expensive. The hands of an ordinary watch can be turned backwards without much risk. It is, however, always better to move the hands forward. —*Exchange.*

HOT WEATHER HINTS.—If you care for no other rule, take this: What is healthy for that multiple pest, the fly, is the contrary for man, and vice versa—so watch the fly, and arrange your house in ways that discourage him: find what suits him and choose the contrary. Now what suits him is the combination of sun and light, darkness always makes him low-spirited, so choose darkness for yourself. Your heat in daytime will be in close proportion to the light you allow. The common notion "just like a man," that to be cool window and curtain must go up to get some fresh air, is one feminine instinct rightly condemned. Recall the closed parlor on the New England homestead, darkened from the sun by closed shutter and curtain, and you will remember that it was the coolest place in the house at noon except the cellar. So—on the sunny side of the house, at least—darken your rooms by shutter and curtain, closing windows as well, until the sun is passed; studiously keep out the sun's light and the air into which he is shining—darkness is coolness and light is heat. Breezes are not always enough, for the sun may give you a hot breeze. Of course, do without your range fire as much as practicable, and cook by gas.

THE WHITEWASH USED ON THE CAPITOL.—For the benefit of "Old Subscriber" and many readers, I here give the receipt for making the brilliant stucco whitewash used on the outside of the Capitol at Washington: Take half a bushel of good unslaked lime, slake it with boiling water (cover it during the process to keep in the steam), strain the liquid through a sieve, and add to it a peck of salt dissolved in warm water, 3 lbs. of ground rice, boiled to a thin paste; stir in, boiling hot, $\frac{1}{2}$ lb. of powdered Spanish whiting, 1 lb. of white glue, add 5 gallons of hot water; let the mixture stand a few days, covered from the dirt, and apply with kalsomine's brush. —*T. B. E.*

Smoke Burners in England.

The discussion of the smoke nuisance has brought into prominence several different kinds of patent smoke burners, the inventor of each claiming for his patent special merits, and each claiming his particular invention to be the best. In London smoke nuisance is punishable with a fine. The act applies to every furnace employed in working engines by steam, and every furnace in any mill, factory, printing house, dye house, distillery, habs house, etc., which is not constructed so as to consume its own smoke, or which is so negligently used that the smoke is not consumed. The penalty is from two to five pounds. As an ordinance is pending in the city council looking to an abatement of this nuisance, it is well first that our aldermen should make themselves familiar with the operation and effectiveness of the different smoke burners now before the public. Experience has demonstrated that it is not impracticable with skillful construction of furnaces, and careful management of fuel, to reduce the evil, for evil it surely is, to such small proportions as to be scarcely worthy of notice. The first conditions for smoke consumption are—such an arrangement of the furnace as to insure a supply of atmospheric air sufficient for complete combustion, and a judicious disposal of this fuel itself, in order that the vaporized carbon may be brought in contact with the air in a sufficiently hot condition. The first of these depends upon the construction of the furnace, the latter upon the care and skill of the foreman. With careful firing it is well understood that even an ordinary furnace will produce comparatively little smoke. —*Chicago Paper.*

It is high time that some action was taken in this city in regard to this matter of smoke burning; especially in view of the present purpose of utilizing a large area at the north end for manufacturing industries, from which point much of the smoke must be driven directly over the northern and central portions of the city.

NEW METALLURGICAL PROCESS.—According to the Philadelphia *Public Ledger*, a new process for using up old metal has been invented by an Englishman named Drake. The resultant is a new metal which is said to possess extraordinary strength and ductility. The process consists in mixing up old steel with a patent compound, and subjecting the whole to an intense furnace heat, when the particles amalgamate. Steel made on this plan has been turned out at the Hunslet works, and sold readily for £45 per ton. The process is said to be second only in importance to Bessemer's invention, and it will be especially valuable as finding use for old Bessemer steel rails.

GOOD HEALTH.

Piles—Their Cause and Cure.

Piles are simply the blood vessels of the rectum enlarged. They are generally caused by constipation. The arteries carry the blood down to the rectum and divide into smaller vessels, which inosculate with the smaller veins of the rectum. These when distended cause the piles. The heart forces the blood along the arteries, and the current of blood loses its force as it returns in the veins, so that a pressure that will not interfere with the current in the artery will in the veins. The blood is forced into the arteries of the rectum and thence into the veins; is prevented by the pressure of constipation from returning, and the distended vein becomes a pile. These, being irritated by hard movements, become ulcerated and we have a bleeding pile, when the wall of the vein is ulcerated through.

Now for the cure. Remove the cause. Keep the bowels free with good, soft, poultice-like movements. Old Prof. C. R. Gilman (who in his day had no peer in his specialty of diseases of females in New York) used to say that the worst case of piles you could find would get entirely well in 6 months and stay well, if you could only get the patient to have soft movements. The compound liquorice powder, which may be obtained of any druggist, is a gentle laxative and splendid for this purpose; also, an ointment of stramonium and tannin is recommended. The stramonium soothes and quiets the irritation and the tannin acts as an astringent to contract down the open vessel. Smear a mass as large as a small marble all around inside the bowel after each movement. Again, a still greater advantage will be gained by a soft sponge to be used instead of paper after each movement. —*Medical Journal.*

HOT WEATHER HINTS.—Dress needs reform, for our masculine garments in particular are robes of martyrdom to absurd conventionalism. An Irishman, walking out in summer clad in extreme winter style, replied to remonstrance that he thought what was "good to kape out the cold was good to kape out the heat," and his philosophy was perfectly sound in the abstract, like all true philosophy, only when he made it concrete on his own body he got it wrong. A thick flannel is the costume when working in a foundry, but not ordinarily; because the foundry's temperature is higher than the body's, while the out-door air of the hottest day is lower. In winter we wear covering in order to keep the body's heat from passing off;

in summer, to avoid scorching by the direct rays of the sun, which are much hotter than the air. This is the only natural and physical reason for covering; usage, to which deference must be paid, is the only other. But we do not get far enough away from the rigidity of usage when heat comes. Why should we resign draperies exclusively to the women, who clad in them look cool, but do not help our own misery? Why should "shirt sleeves" be voted utterly to be an outrage on refinement? They need not be taken in puribus; some modification of them, in garments of more open texture and ampler cut, could be devised were somebody to dare. Now, the wide "pantaloonery" and alpaca or linen coat, with (in cases of extreme hardness) the absence of "waistcoat" and low shoes and umbrella take us to the verge of hazard. We must be elegant, in full dress, and at ease, though we melt, as if physical discomfort and refinement could ever go together.

WOMEN'S HEADACHES.—The New York *Herald*, which devotes most of its space to news, has published a brief editorial on women's headaches, which is certainly more suggestive than many of the articles in that paper. One principal reason why women suffer more than men with headache, is the fact that their life is largely indoors, and they are not able to take so much physical exercise. There is very little complaint of headache at summer resorts, where the windows are always open, and games and excursions constantly tempt people into the open air. Girls who ride, row, sail and shoot, seldom have headaches, and the same is true of those who work in the fields, as women in many countries do. Headaches might be almost banished from civilized society by a wise and careful system of physical training, and a rational system of diet. We ought to be ashamed of having a headache as of being unable to read or write, or speak our language correctly. —*Herald of Health.*

TREATMENT OF BURNS.—Various are the modes of treatment proposed for burns. The last, which appears to come from "good authority," we give below. There can be no question about the carbolized water—although salicylate of soda—one to 20 or 30—would undoubtedly be more useful. Dr. Shady, of New York, recommends that burns be treated by applying a paste composed of three ounces of gum arabic, one ounce of tragacanth, one pint of carbolized water (one part to sixty), and two ounces of molasses. The paste is to be applied with a brush, renewed at intervals, and is stated to be a successful method. Four applications are usually sufficient, the granulating surfaces being treated with simple cerate or the oxide of zinc ointment, as indicated.

WORTH KNOWING, PERHAPS.—Catarrh is called "a fashionable disease," and it really appears as if there was much truth in the saying. It is astonishing how many persons are afflicted with the disease in this city, and how little relief they receive from the generally advertised remedies. Still, it is contended that catarrh can be cured, and many certificates are published to that effect. The latest remedy is given by a Baltimore paper, which says that chewing a twig of a eucalyptus tree, and swallowing the juice, will effect a cure in half an hour. Those afflicted with catarrh might try the prescription, but as faith is necessary to the working of miracles, it is a matter of doubt whether, without faith, a eucalyptus twig will prove a panacea.

MOUTH DISINFECTANT.—A lady asks us to name some harmless mouth disinfectant. It is not a good sign to have a mouth that needs disinfecting. There must be some fault with the stomach, or liver, or bowels. The first remedy should be to regulate the diet and other habits, so that the functions of excretion shall be perfectly established. Then if the mouth needs cleansing with any thing more than pure soft water, a harmless lozenge may be made by rubbing 24 grains each of permanganate of potassa and hyperoxydate of barium into a mass with sugar and glycerine, and dividing it into 14 parts. A very ill-smelling mouth will be thoroughly disinfected by its occasional use. —*Herald of Health.*

CAN BREATHE THROUGH HIS EARS.—Samuel Bremley, a harper of Mystic River, Conn., can breathe for a time without the use of mouth or nostrils, as communication is kept up between his lungs and the atmosphere through his ears. That this is the case, he gives demonstrations when indulging in a cigar, by exhaling the smoke through the same channel.

INJURIOUS TO THE EYES.—Medical investigation has shown that some of the occupations for children at kindergarten schools are calculated to injure the eyesight. Among these are the pricking holes over a tracing on paper, braiding bright colored hands of paper, or sewing fine silk upon tracings.

SANITARY ERRORS.—It is a popular error to think that the more a man eats the fatter and stronger he will become. To believe that the more hours children study the faster they learn. To conclude that if exercise is good, the more violent it is the more good is done. To imagine whatever remedy causes one to feel immediately better is good for the system, without regard to the ulterior effects.

Meeting of Stockholders—North Noonday Mining Co.

The Week.

The beautiful weather which October brought us, has continued during the past week, and already some are beginning to fear a "dry year," because no rain have yet come. East of the Rocky they have been having some terrific storms, attendant with loss of life and property. On this coast, the elements have, as yet, given us no signs of an approaching winter.

Mining stocks continue to be dull, with no present indications of any change. It will take a good fat ore-body on the Comstock to start up a "boom" again. It seems to be the mission of the Comstock to start up stock. The prosperity of other sections does not affect the market. Eureka district is now as prosperous as any on the coast. Utah is speaking very loudly of its prosperity in the hullion shipments its mines are making. A good many men are leaving Arizona for Sonora, on prospecting expeditions, but there is always a certain number to whom "the hills look green afar off."

The mining interests, generally, were never in better condition. The field is much broadened, and the industry on a better basis than ever before. In California we are working away quietly, and not advertising our properties so much as the newly discovered regions, but we are turning out just as much bullion as ever, and at the end of the year it will be found we are still second on the list of hullion producers. Neither Colorado nor Utah, though both have gained, have caught up to California.

The Fulton Iron Works are building a first class set of hoisting works for the Tombstone M. Co. in Arizona. For the same district they are building a 10-stamp mill for the Sunset Co. and a 20-stamp mill for the Grand Central, both to have pans, settlers, etc.

Blunders in Mining.

It seems strange that people will ignore the experience of others so completely as is done in mining operations. The same blunders and same mistakes will be made over and over again in the face of previous failures. People continue to put up quartz mills before mines are developed enough to furnish the mill with ore. They put dry-goods men in to manage mines where first-class experienced miners alone should be. They engage as amalgamators, or furnace men, people without the slightest knowledge of metallurgy, and spend more money on machinery than the mine warrants. They send out as experts to examine property men of whom they know nothing, other than that they call themselves "experts." They invest money on the say so of such people without other inquiry, when in nine cases out of ten their own judgment would be better.

Every day we hear of the repetition of mistakes and blunders for the twentieth time. This new men in mining seem inclined to exercise more talent in getting into trouble than in keeping out of it. The people who get up swindling processes can always find a certain number of credulous men with money who will help them out. Any 30 ft. hole in the ground, well puffed and advertised, will sell as well as a good mine. People will buy the stock in any concern of which they hear frequently, and do it without enquiring anything about it whatever. Therefore, all sorts of swindling concerns are put before the public.

Within the past six months or a year, since Eastern people started into mining, it has been painful to see the mistakes which have been made. Errors and blunders, which experienced miners would avoid, have been committed time and time again. The same will be done many times more no doubt. Telling about it will not stop it. People seem to prefer their own experience to that of others, even in a business of which they know nothing. This is human nature, and all the preaching the newspapers can do has very little effect. A case of this kind came under the observation of the writer a short time since. A gentleman was very enthusiastic about a "new process" which was to work wonders. He was told it was not new; had been tried many years before and had been a failure. Was told to come and look at certain records to prove these assertions before he invested his money. Notwithstanding this, he did invest several thousand dollars without looking at the said records, and, as a natural result, lost his money.

This is not an isolated case by any means. Only this week we hear of people building a "mining boat" to dig up gold from river beds by vacuum process in Montana, "the same as is done in California," when we have proved a dozen or more times that no such method of mining has been successful. Men are even now investing their money to help a process where gold is made out of water, notwithstanding the fact that a State official has investigated the process and pronounced it a fraud. People are putting money into mining machinery constructed on principles which experience has proved to be fallacious.

In fact, over and over again are the same old blunders made and the same old mistakes committed. The journalist whose advice is unheeded, simply performs his duty in chronicling the failures which result, solacing himself with the reflection that "I told you so."

Deep and Shallow Mining.

There are very many mining districts on this coast which not long since were flourishing and of which we now hear little. At the same time there are several which, after lying idle for a long time, were started up again manfully. The reason why many of these were abandoned was because the first comers did not go down deep enough. They scratched around the surface, and when surface pockets were gone, they went too. Our biggest bonanzas have been from deep mines; but some people often get discouraged too soon.

A gentleman in Utah the other day being interviewed by the Salt Lake Tribune about mining affairs in Utah, was asked if he didn't acknowledge that the old camps were not as lively as they used to be. His answer was as follows:

"That's just what's the matter with Utah. It isn't that the mineral is lacking, but we have not been mining here at all. There is Birmingham, as long as a miner had to climb a tree to get at the ore, why every stump and grass root in the camp had a miner at it; but just as soon as they had to get down below daylight, they stopped. You can't read a book through the cover, and just as long as mine owners expect to find ore above the grass, so long will the old camps be dull. I defy any man in this world or the next to name any mine that has played out. It isn't in the order of things, because when you get down on a ledge below mineral, you must have passed the source, and that can't be done."

The amount of capital invested in the manufacturing enterprises of Alameda county, California, are \$1,300,000.

Ledges in Placer Claims.

The Commissioners of the Land Office has decided that lode claims within the limits of a placer tract, for which claims patent is not sought in the placer application, are excluded from the placer patent, though lode claims adversely held may be excluded from the survey of such placer claim.

A man named Sanderson applied for a patent on a placer claim in Colorado, posted his notices, etc. Before this time of publication was up, a number of people protested, alleging that they were owners of lode claims on the same land. They did not commence suits in court, but relied on the Land Office to protect their lodes from the patent. Sanderson voluntarily excluded certain lode claims from his application. The Commissioner finally sent, at the expense of the claimant, a surveyor to survey this placer claim. His instructions were to the effect that where lode claims have been duly located, and an application for patent to placer land which embraces such lode claims is made, the plat and survey of such placer should correctly show the locus and extent of the lode claims, that while it is true that the patent for the placer will except from its operation all lodes and veins known to exist at the date thereof without assuming to do what would be impracticable, viz: to name and describe them; yet where, as in this case, the owners of certain lode claims have by protest advised the Office of the existence of such claims, they should be excluded by metes and bounds. His instructions were to exclude not only such lodes as were admitted to exist, but also all others duly located.

The deputy who made the survey designated, by dotted lines, on the plat several "lodes," but said: "These pretended lode claims have no mineral lode deposit or rock in place, or anything entitling them to the name of lode claim; the shafts are in wash or drift; and I hereby certify that no known lodes exist upon the foregoing described placer other than have been excluded from within the exterior boundaries of placer."

The Commissioner decides as reported in Copp's Land Owner that a patent issued for a placer claim which contains a vein or lode, the existence of which is known, is not a conveyance of any lode deposit which may be included therein. And all placer patents issued embrace a clause of reservation, as follows: "That should any vein or lode of quartz, or other rock in place, bearing gold, silver, cinnabar, lead, tin, copper or other valuable deposits, be claimed or known to exist within the above described premises at the date hereof, the same is expressly excepted and excluded from these presents." Notwithstanding the general reservation quoted, the Commissioner deems it his duty before issuing patent for a placer claim to require all vein or lode claims, the existence of which is admitted by the applicant for patent, but not applied for by him, or is reported by the Surveyor-General, to be excluded by actual survey, and the placer claimant should not be permitted to pay for the area so excluded; it follows that if any lodes or veins be known to exist at the date of patent to the placer claim, the owner thereof may make application for patent thereto at the proper land office precisely as if no patent had been issued for the placer claim, and upon regular proceedings being had and proof furnished that said lode was known to exist as aforesaid patent will issue.

EL DORADO CANYON.—J. W. Joachim, Deputy Mining Recorder of El Dorado District, writes to the Pioche Record the following particulars of this District: El Dorado canyon is situated in Lincoln county, Nevada, about 200 miles south from Pioche, being bounded on the southwest by San Bernardino county, Cal., and on the east by the Colorado river. A fifteen-stamp mill belonging to the Southwestern mining company, is now in operation, running on ore from the company's mines, the Techattacup, Savage, etc. Wood is furnished in the canyon from Cottonwood island and Mohave valley, at \$8 per cord. Water has lately been obtained in plenty by digging wells two miles south of the O. K. mine. About 65 men are now employed in and about the canyon. This place where the new mines are located, is situated about ten miles southwest from the Southwestern mining company's mill, to which mill there is a good road from the mine; down grade all the way and no falls. Among the new locations are January, down 35 ft.; the O. K., down 25 ft.; Eldorado, 15 ft.; Lone Star shaft, 25 ft.; Silver Eagle Tunnel, 70 ft.; Silver Legion shaft, 50 ft., and the Morning Star. The Silver Legion has been bonded for \$10,000 to T. B. Pehy, and two-thirds of the Silver Eagle has been purchased by James Cronin. J. B. Crocker, Goodhue & Co. have purchased the Clara, Standard, Independence, Columbia, Constitution, Union Flag, and Fifteen-two. The present outlook of the canyon is very bright.

The new stamps in the Alexander mill have worked smoothly since they commenced operation, and a vastly increased hullion product may be confidently expected. A shipment was recently made of \$7,193.12.

Mining Notes on a Recent Trip Through Amador County.

Amador county differs from the counties both to the north and to the south in that its mining industry is confined at the present time almost entirely to quartz mining, comparatively only an insignificant amount of gravel mining being done. The principal quartz mines are on what is known as the Mother lode of California, which crosses the county from north to south in the foothill region. Other important mines are at Volcano on the east, and at Drytown on the west.

At Jackson, in the southern part of the county, there is at present considerable activity in prospecting for new locations and in developing the old ones. The Zelle mine here is located on one of the largest ledges in the State. The work being done is on the 600 level, and consists of crosscuts and drifts to more fully develop the ore body. The new 20-stamp mill is unquestionably one of the finest in the State. As the ore contains a considerable percentage of rich sulphurets, very complete works for their reduction are being erected. At the Kenady mine only prospecting work is being done. The Kruger and Vaughn mines are at present full of water, but it is reported will soon be started up. About two miles east of the town is a pocket mine, owned by Wm. DeWitt, in which several rich strikes have been made during the last few months.

Sutter Creek, about five miles north of Jackson, is a mining town of considerable importance. It is well built up, contains several fine stores, churches, hotels and two foundries, and has none of the played-out look so common among mining towns in California. The town is to a great extent supported by three large mines. The Amador mine, one of the oldest and deepest worked mines in the county, is taking out low-grade ore enough to run its 40-stamp mill on full time. The Mahoney mine has its main shaft down 800 ft., and is opening and prospecting its ore-body preparatory to supplying its 40-stamp mill which has just been built. The mill is to be run by water power. At the Lincoln mine some ore is being taken out, but no large quantity, as their mill is at present working on Mahoney ores.

At Amador City the celebrated Keystone mine is being retimbered. The mill also is being thoroughly overhauled and improved. At Drytown and Plymouth the principal mines are running and paying well. At the latter place is the largest mill in the county, running 80 stamps. New hoisting works are being put up there to work the ledge to a great depth.

Nearly all of the ore at present being taken out and worked is of low grade, from \$3 to \$15 per ton, and is generally free milling, carrying only a small percentage of auriferous sulphurets. Very little improved sulphuret-saving and concentrating machinery is in use; though so large is the aggregate of rock crushed, that its introduction could hardly fail to be profitable. A noticeable feature, as one travels across the county on the quartz belt, is the number of idle and abandoned hoisting works and mills. In some instances it seems as though expensive machinery had only been placed in position to rust and decay.

Advice to Eastern Investors.

We have had more experience on this coast in mining matters than the residents of communities in the Eastern States, simply because we have the mines here and they have not; and we have been mining 30 years, while they have just begun. Of course, we speak of mining for the precious metals. We see many of them now making blunders which we try to prevent, but our efforts are not always crowned with success. A good many of the people there look upon us out here as a sort of uncivilized crowd anyhow, and think they know as much about the business of mining as we do, and perhaps a little more. Hence the advice given by the press of this coast has gone unheeded in many instances, where money would have been saved if attention had been paid to warnings against frauds, doubtful speculations, etc. The newspapers East have not always done us justice in this connection, but the Boston Economist, in a recent issue, acknowledges the mistake, and says: "As a general rule, the Eastern mining papers greatly ignore the mining districts of the Pacific slope, and when they do speak of them editorially they are apt to refer sneeringly to 'California practices,' or 'the methods of the Comstock'; apparently oblivious of the fact that the product of the Comstock lode alone has been \$300,000,000, and that the dividends disbursed to shareholders in the mines west of the Sierra Nevada mountains since 1849 aggregate about \$136,835,000. In the matter of stock speculation and the management of affairs on the exchanges, the California papers have a right to speak authoritatively, for their experience in mining matters has been greater than ours, and their knowledge of the men who have joined us is derived from a long association with them. When, therefore, these journals give Eastern managers advice—that is, when they speak soberly, and not in a spirit of haughty arrogance—their advice should be received in the spirit in which it is given, and heeded."

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held Wednesday evening last. Donations were received as follows: By Jerome Tay—A specimen of obsidian from Indian quarry on northeast side of Mount Shasta, Siskiyou county, Cal. By J. T. Gibbs—Hydraulic limestone from Benicia. By Dr. A. B. Stout—Obsidian and bottle of water from hot springs on Mono Lake island, and a bottle of Mono Lake water. By James W. Wilder—Blue clay, 126 ft. deep in artesian well; yellow clay sea shell coars, 118 ft. deep in artesian well, corner of Folson and Eleventh streets; iron-lookingslag, 110 ft. deep in Brickwedel's artesian well, corner of Franklin and Fulton streets; wood in blue clay 129 ft. deep, from the same well, and wood 105 ft. deep in sand and gravel, two ft. below the rock. By J. A. Mellon of Colorado—Seeds of *Prosopis juliflora* and seeds *Prosopis pubescens*, specimens of bread made from them by the Indians; also seed of "wild sage." By Charles H. Gilbert—*Brachyopsis zosterium*. By J. A. Mellon—*Sceloporus undulatus*, *Gerrhonotus muticarinatus*, *Pituophis catenifer* and *Charinca plumbea*.

Mesquit Bread.

A communication was read, written by Capt. J. A. Mellon, of the sloop *Southwest*, Colorado river, who furnished cans containing seed of the mesquit tree, explaining that the screw-bean bears two crops a year, the first ripening in June, the tree being in bloom for the second crop at the same time. He had a wheel on his raft made from the wood of the screw-bean, and it acted admirably, as it did not check, and it shrieks very little, although exposed to the sun. The Indians depend mostly on the mesquit for their supply of winter's food. He sent a sample of the bread they made from the fruit. When the bean is ripe, they collect it in large baskets, and pack it to this nearest point on the river, where there is a ledge of rocks. In all those places they have mortars formed by grinding into the ledge, and there the old squaws work pounding it up, molding it in baskets, and drying it in the sun for winter use. Their leaves sometimes weigh 20 pounds. When the crop is all harvested, they build a platform about three ft. off the ground, and store it away until their corn, pumpkins and melons are gone, when they draw on their mesquit bread. The beans are also used as horse feed, and at the mill it sells for three cents per pound. When there is a scarcity of hay, barley and beans are the food, and when hay is plentiful, beans and hay are the fodder, and the teamsters say it wears first rate. He believed that the screw-bean would make the finest of tree-nails for ship-building, as the longer it stays under water the tougher it becomes. He did not think it would grow north of 33° of latitude on this coast, and on the Atlantic not north of 30. In good soil it is a rapid grower, and he thought it would make a good hedge plant. Dr. Kellogg called attention to the durability of the mesquit tree, and explained that he had been in a building which had stood almost a century, and the wood was perfectly sound. It partook of the nature of our fir, and, although the wood was somewhat brittle, it was, when dried, very rigid. The mesquit furnished the very best kind of girders for internal structures. Dr. Englemann, of the United States Forestry Commission, who was requested to dwell upon the peculiarities of the mesquit, stated that he had just returned from the southern part of Arizona, where he found extensive woods of the mesquit tree, miles in extent and breadth, south of Tucson. There the trees were larger than is generally seen, some of them being a foot and even two ft. in diameter, and something like 30 or 40 ft. high. They had the aspect of the willow tree, but he would compare them to the olive of southern Europe. Straight stems were very rare, they being very much inclined to be crooked. The Mexicans managed to cut posts or timber of eight or ten inches in diameter, and ten ft. long, which they sold in Tucson, where they were used in building, proving almost indestructible and unaffected by moisture. They were used as girders over openings, such as doors and windows. They are very durable, as was proved by the fact that mesquit timber was found in those ancient dwellings on the Gila river, the prehistoric dwellings well preserved. The wood was very heavy, and was the best for fires that they had there, and probably in existence. It afforded very little shade, and the ground beneath the tree was covered with grass and low herbaceous plants.

Oak and Cactus.

Some beautiful elongated acorns had been presented to the Society, and some of the members requested Dr. Englemann to make some remarks on oaks. He stated that it was well known amongst carpenters and wood-workers generally upon this coast, that the oaks here are quite inferior to those of the East. There was only one species here which was really of any value, and that was a species of live-oak, which was very hard, heavy and durable. There were four or five species of white oaks upon this coast, but none of them are equal to the Eastern white oak. There were 10 or 12 species altogether here. The President noticed that specimens of the *nostoc* had been donated. It grew rapidly, and it was only troublesome when it began to decay, giving the drinking water a very unpleasant, if not unhealthy, odor. Dr. Parry handed up a sam-

ple of cactus grown in this country. Dr. Englemann was again requested to say something about the cactus. He complied by stating that the cacti are found a foot and even two ft., in diameter, and from 30 to 60 ft. high. The wood is distributed in separate bundles, which are as long as the cactus itself. These sticks, more or less round, are two inches in diameter. The Mexicans cut down cactus, and allow the fleshy or pulpy part to decay, collecting the sticks which are brought into Tucson by wagon loads, and used like laths. They are very strong, usually do not break, and last almost forever. The cactus itself was much more common than was generally known, the hills around Tucson being covered with them.

The Kendall Quartz Mill.

We present herewith an engraving of an improved quartz mill invented by Stephen Kendall, of Jackson, Amador Co., Cal. The engraving represents the mill with all its late improvements.

The improvements consist in the novel construction of the cam, and in the employment of a peculiarly shaped tappet, which is secured to the stamp-stem so as to revolve with the stamp

The Kendall Quartz Mill.

at the same time that it lifts. The cam is a plain curved incline, mounted on a rubber cushion, so as to prevent jarring. The stamp is raised by the tappet rising on the incline or cam, and as it drops off the cam a grinding action is produced by the rotation of the stamp until it again rises.

By this means both a crushing and grinding motion is produced in the stamp. The mortar is constructed in such a manner as to accommodate one stamp only, but having three discharge openings, fitted with screens, the discharge is fully equal to the work the stamp does. The stamp is precisely the same as the old style, with the exception that it is operated by different devices, and has the grinding action above specified.

The rotation of the stamp is accomplished by a belt and horizontal pulley at the upper end. A peculiar clutch is used, one part of which is so connected as to rotate with the pulley, while the other part is secured to the stamp stem so that when the pulley is rotated the union is such that the stem and stamp are allowed to rise and fall freely by the action of the lifting cam. This clutch is the subject of a separate patent from the original one obtained by Mr. Kendall, the improvement being an important one.

Both a grinding and a crushing action are produced by the peculiar motion of the stamp, giving an increased capacity over the simple dropping stamp of an ordinary battery.

The inventor gives us the following figures concerning weight and capacity: No. 0, 1-horse power, has a capacity of 1 ton in 24 hours; the stamp weighs 100 lbs., whole mill 600 lbs.

No. 1, with 400 lb. stamp, weighs 1,900 lbs. and has a capacity of 2½ tons. No. 2, with 800 lb. stamp, weighs 3,500 and is of a capacity of 5 tons. No. 3, with 1,000 lb. stamp, weighs 4,500, and has a capacity of 8 tons. No. 4, with 1,500 lb. stamp, weighs 5,500 lbs. and has a capacity of 6 tons per 24 hours. All these are based on No. 6 screen in battery.

Mr. Kendall has many testimonials from those using these mills as to their efficiency and capacity. The mills are built all ready for shipment, no millwright being necessary to set them up. The mill is not now an experiment, but has been for more than two years at work at various places. The mills are being made at the National Iron Works (Marschutz & Cantrell), N. W. corner Main and Howard streets in this city.

Plow Share Fastener.

Speaking of plows, for the plowing season is at hand, we introduce a small engraving of a new device for attaching the share. It was invented by Jacob P. Patrey, Dunnigan, Yolo county, Cal., and patented through the MINING AND SCIENTIFIC PRESS Patent Agency. It has been tested by a number of Yolo county farmers, and their testimony has been given in our advertising columns. To attach the share to the plow, all that is necessary to do is to catch the hook (which is seen at the lower edge of the mold-board in the engraving) to the stud or projection on the share near it. This hook is attached to a compound lever shown by the dotted line in the engraving, and when the lever is thrown over, the hook draws the share up lightly and snugly into its proper position. The lugs on the upper edge of the share fit into the slots on the lower edge of the mold-board and prevent its moving from place.

When it becomes necessary to remove the share, by throwing the lever back, it is released readily and quickly, and can be taken away and sharpened, or another share substituted. The lever and ends are on the rear part of the

Patrey's Plowshare Fastener.

plow, and, therefore, form no obstruction to its passage through the soil. This fastener can be attached to any ordinary plow that has a mold-board and share.

INSTRUCTIVE LECTURES.—The citizens of San Francisco and Oakland are just now enjoying a rich literary treat, in listening to a course of lectures now in process of delivery by the eminent historian and lecturer, Dr. John Lord. The subjects chosen are "The Great Characters of History." These lectures are of the very highest order of merit, and are listened to and appreciated by large and intellectual audiences. The Doctor is no orator and makes no pretensions to elocutionary grace; but in regard to the subject matter of his discourses, and the manner in which they are prepared nothing but terms of high praise can be employed, and no thoughtful person can possibly fail to be greatly interested and instructed by listening to them.

DR. LAW, a well known Black Hills mining man, called at our office this week. The Doctor sailed on the Pacific Mail steamship *Colima* for Panama. He goes on a trip to the mining regions of New Granada, Peru and Chile. Our readers will be favored with his views on the mining regions of those countries, as he has promised to send us a letter from time to time.

ON the 12th, says the *Arizona Star*, Hon. J. K. Luttrell closed the largest mining transaction yet negotiated in Arizona, the trade was made for Eastern parties. The mines purchased were the Belmont, consideration \$250,000; San Antonio, \$50,000 and the Washington pool, \$200,000. The two former properties were owned by H. D. Bacon, of S. F., and an old and true Arizonian, Thomas Yerkes. The owners of the Washington pool are all hard-fisted miners, and deserves every dollar they are receiving on their bonanza.

The Bechtel company, of Bodie, connected with the Bodie tunnel on the 14th inst., and half the size of the tunnel came under their shaft, so they fell directly into it. Everything is harmonious with both companies. It is of great value to both sides, giving good ventilation and making a very cheap way of putting ore to the mills in that canyon, thereby facilitating further workings to a very low figure.

THE Fulton Iron Works are employing from 275 to 300 men and are working to full capacity.

Properties of Silver.

We have received this week a neatly bound little book containing silver and gold tables as used by the New York Metallurgical Works, of 104 and 106 Washington St., N. Y. It was sent us by Mathey, Kustel & Riette, mining engineers and metallurgists, a branch house of the one in San Francisco on the corner of Pine and Leidesdorff. The book bears the "ear marks" of our friend, Mr. Riette, and is useful particularly to assayers. A couple of pages are devoted to the "Properties of Silver," and this we copy as follows:

Silver has been known from the earliest ages; coin of that metal has been found dating back to 800 B. C., and in the pyramids of Egypt linen stained black by salts of silver has been discovered.

The alchemists called it Luna or Diana, and we still call the fused nitrate of silver lunar caustic. The Latin name for it was argentum, from which we derive the term argentiferous and the chemical symbol Ag.

Silver is very ductile and the best conductor of heat of all the metals; its atomic weight is 108; its specific gravity varies from 10.43 to 10.56, according to whether it be cast, hammered, drawn, etc. It fuses at about 1,832° F. (which is lower than the melting point of gold or of copper) and can be volatilized by the oxygen-hydrogen flame. In melting it absorbs oxygen from the air, which it gives off again on cooling, causing the molten mass to spit when suddenly cooled. (Only pure silver acts thus.)

Pure silver may be obtained crystallized in cubes and octahedrons. It dissolves in nitric acid of medium concentration; concentrated sulphuric acid changes it into sulphate of silver at a boiling heat, while muriatic acid does not act upon it. Quicksilver unites with it, forming an amalgam, and it is easily alloyed with many other metals during fusion.

The characteristic test for silver in (acid) solution is made by adding muriatic acid or a soluble chloride, when a white, curdy precipitate of chloride of silver is formed, insoluble in water or in acids, but soluble in ammonia (also in cyanide of potassium or hyposulphite of soda); from the ammoniacal solution acids reprecipitate the chloride of silver. Very dilute solutions of silver are rendered opalescent on applying this test.

All compounds of silver yield metallic silver when fused with carbonate of soda before the blowpipe.

Caustic soda or potassa precipitates silver from its solution as grayish-brown oxide of S., insoluble in an excess of the precipitant, soluble in nitric or sulphuric acid.

Ammonia produces the same precipitate, soluble in an excess of the precipitant and in nitric or sulphuric acid.

Carbonated alkalies produce a precipitate of yellowish-white carbonates of silver soluble in carbonate of ammonia and in nitric and sulphuric acid.

Sulphureted hydrogen and sulphide of ammonium produce a black precipitate of sulphide of silver, which is decomposed by boiling nitric acid with elimination of sulphur.

Copper, zinc and other easily oxidized metals precipitate metallic silver as a gray, spongy powder, and some organic substances act in a similar manner.

Silver is found in its native state, alloyed with gold, and as sulphide of silver, frequently with copper glance, galena and other metallic sulphides, less frequently as chloride of silver (horn silver) and rarely as iodide or bromide of silver.

The water of the oceans contains traces of silver.

A NEAT JOB.—In repairing the Atlas furnace and fixing for a run of ore, says the *Eureka Sentinel*, it was discovered that the stove smoke-stack had sprung so much as to lean dangerously down hill toward the dump. It was at least 18 inches out of plumb, and Henry Allen, of the Eureka Co., was called upon to make the repairs. Allen was busy, so he sent up Jake Berge, who righted the immense tower of stone by simply cutting away on the upper side a slice of the rock near his base. She now stands as true as ever. It was a very nice piece of workmanship, and Mr. Berge deserves the mention due skilled labor.

THE case of the South Mountain Consolidation mining company in bankruptcy was on hearing before Judge Hoffman of the U. S. District Court last Friday. The hearing is on application of the creditors for the levy of an assessment to pay the debts of the bankrupt corporation, amounting to between \$400,000 and \$500,000. The case involves the power of a U. S. Bankruptcy Court to levy an assessment on the stock of a bankrupt corporation to pay its debts.

A LOT of miners at the Monterichard mine, Alameda county, "struck" and quit work the other day on account of the employment of a Chinese cook at this boarding house. The boarding house is not connected with the mine, but it seems to be a rule of the Superintendent that the miners shall board at the regular boarding houses.

A DIVIDEND of 25 cents a share, or \$25,000, was paid by the Silver King mine, Friday, the first in some time.

The Green Mountain Mill and Mine.

At the Crescent during the past six months, says the *Plumas National*, much of the old time activity of that once busy camp has been renewed. This is principally owing to the extensive improvements of the Green Mountain company. The extent of work done during the past summer shows well for the management, and now that the new 60-stamp mill is about completed, we can speak of the work more in detail. Thirty-two stamps have been running on this mine the past three years. For two years the company has been pushing work to open the ledge in No. 5 tunnel. This tunnel has been running on the vein about 900 ft., and is now over 2,000 ft. in length. It has opened two fine pay chimneys of ore, and the face is within some 80 ft. of the main pay body that was worked in No. 4 tunnel. This ore body is greater, both as to length on the vein and extent of backs, than any other mine in the county; and few in the State can equal it. The second pay chimney through which the company is now raising from No. 5, shows the ledge to be 12 ft. wide, and gives 400 ft. of backs to No. 4, and from that point to the surface is 350 ft. additional, making 750 ft. of standing ore. The quality of gold in the chimney is \$17.52 per ounce, a very fine showing for quartz gold.

As depth is gained on the main pay body of this mine, every level shows that the vein is increasing in width. In the No. 4 the vein was 80 ft. wide from wall to wall, and a greater width is expected in No. 5. This mine has produced in the last 10 years a large amount of bullion, with a very limited crushing capacity, over three quarters of a million dollars before the purchase by the present owners in June, 1879, since which time the developments have been on a more extensive scale, and have given the splendid results herein mentioned. Prof. W. P. Black, of New York, the eminent expert and mining engineer who made a thorough examination of the mine last winter, has just completed his second examination, and fully confirms his former high opinion of the permanency and great value of this property, and showing the resources to be years ahead of the increased milling facilities. Another valuable adjunct is the extensive water privileges, and the cheapness with which the ore can be handled. No mine in the State can make a better showing. The ore all falls from stopes, is handled through chutes, and, we are informed, can be delivered in the mill and crushed at an average cost of \$2 per ton.

This fine development with such large reserves of ore encouraged the energetic President of the company, Mr. H. C. Bidwell, to complete arrangements the past spring for the erection of 60 stamps additional on the property. With one exception this is the largest gold quartz mill in the State, and has involved an expenditure of some \$60,000. In a short time the company will have 92 stamps running. The mill is situated at the foot of the mountain, a short distance below No. 6 tunnel, which will give some 400 ft. still greater depth on the mine. The mill building to the tramway is 148 ft. long and 72 ft. in width, complete in all its appointments. The plans were drawn by Mr. Wm. Manson, of the Greenville Iron Works, and it has been erected under the supervision of Mr. Enos Burns, a master mechanic. There are 12 batteries of 5 stamps each, and self ore feeders to each battery. The stamps are about 800 lbs. weight; the aprons are 8 ft. long and width of the mortar. The plates are all silvered, all silver plates also extend down the sluice boxes. The ore is entirely free milling, and the amalgamation is done in the mortars and on the plates. The driving pulley is 12 ft. in diameter, and the belt 36 inches wide, of 5-ply rubber. All the modern improvements in quartz mill building is combined in this work. The power will be furnished by a 6-ft. diameter Knight water wheel, under 400 ft. pressure, through 11-inch heavy iron pipes. The tramway, by which the ore is delivered to the mill, is a substantial and complete work. It is 900 ft. in length, the upper and lower ends being supported by strong trestle work, and in the center for some 300 ft. the ties being laid on the ground. This track is double, and the cars run by wire cable direct into the mill, the track extending the entire length of the dump, whereby the ore can be delivered at any point. No rock breaker is necessary in this mill, the rock going direct to the ore feeders. The mill dump has a capacity of 1,000 tons of ore, and the mine dump from which the cars are loaded, about 800 tons. The company own 3 contiguous claims, 4,350 ft. in length on the vein, also a large timber tract, all held under United States patent. The fine, new and well conducted hoarding-house, company's office, superintendent's house, store-house and miners' cabins are all in neat order, and form quite a settlement. In all, it is one of the most promising and best managed mines in the State, and we are glad to record its success.

THE Schenectady Locomotive Works are building a large locomotive for the New York Central road, to be called the "Wm. H. Vanderbilt." The front end is to be mounted on 33-inch paper wheels, the first instance we believe, of truck wheels of this size being used under an engine, except in a case of the "Uncle Dick," on the Atchison, Topeka & Santa Fe road. The ordinary sizes of engine truck wheels are 26 and 28 inches and latterly 30 inches.

ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE
CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. PH. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

Metallurgy and Ores.

Nevada Metallurgical Works,
No. 23 STEVENSON STREET,
Near First and Market Streets.

Ores worked by any process.
Ores sampled.
Assaying in all its branches.
Analysis of Ores, Minerals, Waters, etc.
WORKING TESTS MADE.
Plans furnished for the most suitable process or working Ores.
Special attention paid to Examinations of Mines; plans and reports furnished.
E. HURN,
C. A. LUCKHARDT,
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,
MINE and MILL SUPPLIES,

**CHEMICAL APPARATUS AND CHEMICALS, DRUG-
GISTS' GLASSWARE AND SUNDRIES, Etc.**

118 and 120 Market Street, and 15 and 17
California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scoriaires, etc., including, also, a full Stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

**W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.**

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.

The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamp. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.

Furnished also in sections for packing.
For circulars and prices apply to

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arseniurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 155 pages, embracing illustrations of furnaces, implements and working apparatus.
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.
Price, \$3.00 coin, postage free.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including
the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated, 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

COPE'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

A New Edition.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 155 pages. 1880. A valuable and carefully written work. Post-paid, \$3.00. Sold by Dewey & Co., S. F.

RECENTLY PUBLISHED.**WORKSHOP RECEIPTS**

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1875.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, mill, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 36 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed. Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made \$2.50, postage paid.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia
March 10 1880.

Diamond Drill Co.

The undersigned, owners of LESCHOTS PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions rendered upon patent cases in litigation, for the benefit of our readers:

COMMISSIONER'S DECISIONS.
Huntley et al. vs. Smith.

Middlings Purifier. Appeal from the decision of the Examiner of Interferences, denying motion for award of priority of invention upon the record under Rule 107. Decided September 22d, 1880. Marble, Commissioner.

1. When the party last filed in the office does not in his preliminary statement allege a conception of the invention in controversy, earlier than the record date of the party first to file his application, it does not overcome the *prima facie* case made by the date of application, and judgment on the record should be rendered against him.

2. The mere fact that an earlier application was made by the party disclosing the invention in dispute cannot avail to give a *prima facie* date of invention in this proceeding, unless there is some reference in the later application which seems to connect it with the former.

3. While the filing of an application does not prove reduction to practice, it establishes the fact of invention.

4. Applications diligently prosecuted evince a faith on the part of the inventor, equal to that which would follow from a reduction of this same to practical form, and the latter is not a condition called for in the statutes.

5. In cases of long delay to prosecute the invention beyond mere description, either by applying for a patent or by a reduction to practical form adapted to use, the question of abandoned experiment or conception will rise and should be considered a factor in the case.

The decision of the Examiner is reversed.

DECISIONS OF THE U. S. COURTS.

Rogers vs. Beecher, et al.

U. S. Circuit Court, Northern District of New York. Decided September 16th, 1880. Wallace, J.

1. A patentee is entitled to the presumption of priority which his patent affords, and this presumption is only overcome by clear and satisfactory proof to the contrary.

2. The plaintiff is obliged in order to recover damages to prove affirmatively that the defendants have employed the invention patented, and having in this case failed to do so satisfactorily, the bill was dismissed.

Hoffman vs. Young.

U. S. Circuit Court, Eastern District of Pennsylvania. Decided April 23th, 1880. Butler, J.

1. A mere aggregation of old parts without any new result issuing from their united action is not patentable.

2. Old parts to be patentable must combine in operation and by their joint effort produce a new result. They need not act simultaneously, but it so arranged that the successive action of each contributes to produce the result, which, when obtained, is the product of all the parts viewed as a whole, a claim for this combination may be sustained.

3. No rule of universal application has been laid down defining a patentable combination, but two things are always necessary: first, a novel assemblage of parts exhibiting invention; second, the co-operation of parts in producing a new result.

4. By the term "co-operation" the Courts do not mean merely acting together or simultaneously, but united to a common end—a unitary result.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR MAKING PAPER PULP FROM WOOD.—Rufus B. Lans, Stockton, Cal. Patented Oct. 12, 1880. No. 233,105. This invention relates to an improved machine for making a pulp from wooden blocks which can be used for paper-making; and it consists in the employment of a series of hard metal pins, which are placed in rows in such a manner, that two or more rows will make a continuous cut. The pins project from a surface or groove, which is suppressed below the general level of the disc or cylinder which carries them, said pins being adapted to scrape off the fibers of the wood in small particles or pulp, while the depression allows the pulp to be carried away from the cutting-face of the pins as fast as produced.

GRAIN MEASURE AND REGISTER.—Charles S. Ball, Amador, Cal. Patented Oct. 12, 1880. No. 233,136. This device consists in certain details of construction and combination of parts, whereby the grain from the separator is measured, and the amount that passes through the measure is registered, and afterwards passed to the sack in the sack-holders. In this way the grain is measured accurately, and the amount thrashed is registered. The measure may be used for any purpose, such as measuring grain in ships loaded in bulk, in warehouses, etc.

ORE CRUSHER.—G. F. E. Brinckmann, Oakland, Cal. Patented Oct. 12, 1880. No. 233,139. This machine answers the purpose of both crusher and pulverizer in one, taking quartz in pieces as large as those received by an ordinary rock breaker and discharging it as fine as is necessary. The crushing and pulverizing in this machine is done entirely by rollers, the ore being crushed either wet or dry. By changing these rollers once in 24 hours a uniform wear upon the whole device is maintained.

STOCK CAR.—Lyman Woodruff, Ellensburg, Org. Patented Oct. 12, 1880. No. 233,129. This object of this car is provide a series of stalls in which live stock may be transported on cars or vessels and fed and watered by this way. It consists in certain details of construction whereby the stalls can be taken apart and set up at will, and he accommodated to suit the space at disposal.

In the recent communication of J. W. A. W., entitled "Miners' Peak," for "Smidway Peak" read "Sunday," and "Glenville" for "Greenville."

The Eureka Consolidated Mine.

The Eureka Con. mine at Eureka, Nev., is a mine with a good record. With the exception of a very important law suit some time since, everything has gone on smoothly with this company since it started. It has made a good many men rich, and not being a "stock deal," has not made any poor. The mine has always had ore, and has paid regular dividends, amounting in the aggregate to four and a half million dollars.

The annual meeting was held this week, and the Secretary made the following statement for the past year:

RECEIPTS.	
Product refined bullion.....	\$1,659,925
Sales lead.....	707,593
Sales sundry supplies.....	1,203
Advances on shipments.....	1,027,255
Superintendent's drafts (outstanding).....	1,922
Bills for supplies (not due).....	850
H. Donnelly, Supt., Oct. 11, 1879.....	143
Cash on hand Oct. 11, 1879.....	9,157
Total.....	\$3,399,053
DISBURSEMENTS.	
For mine account.....	\$ 374,473
Smelting.....	423,134
General expense.....	24,726
Expense, San Francisco.....	11,673
New shaft.....	35,316
Freight, raising, etc.....	423,547
Interest.....	4,038
Legal expense.....	11,146
Advances on shipments.....	1,408,078
Dividends Nos. 48 to 59 inclusive.....	380,000
K. R. property.....	200,000
Supt's drafts (carried over from last year).....	12,635
Personal accounts (carried over from last year).....	869
H. Donnelly, Supt., Oct. 9, 1880.....	97
Cash on hand Oct. 9, 1880.....	24,521
Total.....	\$3,399,053

The mine came to the front as a dividend payer about 10 years ago. The capital stock has been \$5,000,000 in 50,000 shares from the start. The only money paid in on account of capital consisted of two assessments of \$1 per share each, the last of which was levied in May, 1876. With this paid in capital of \$100,000 the mine has produced many thousand tons of gold, silver and lead, which has netted many million dollars. There have been 60 dividends paid, ranging from 50 cents to \$3 per share. No dividends were paid in 1872 or 1876. It was in 1876, we believe, that the mine was in litigation. The \$100,000 paid in by the stockholders has resulted in their receiving back in dividends the sum of \$4,405,000. Appended will be found a list of the dividends paid during each year up to and including the ones for Oct. 21st, 1880:

Year.	DIVIDENDS.	No.	Amount.
1871.....	6	\$275,000
1873.....	4	200,000
1874.....	4	175,000
1875.....	8	300,000
1877.....	4	600,000
1878.....	12	1,800,000
1879.....	12	800,000
1880.....	10	230,000
Totals.....	60		\$4,405,000

Mining in River Beds.

We see by a Montana paper that an "old California miner" has a dredging machine similar to those used in mining river beds in California, and proposes at an early day to erect the machine in the bed of the Missouri river, near Edmonston's Ferry, for the purpose of prospecting and mining. The *Independent* says further: "It has long been believed that the beds of the Missouri and other large rivers in Montana contained rich deposits, perhaps richer than any mines heretofore opened in the Territory. Mr. Lissner now proposes to test that question. His machinery is ample for the purpose. We understand that the tube is capable of lifting from 300 to 400 tons of dirt in 10 hours. The dirt is taken from the bed of the stream by what is known as the 'vacuum process' and then washed in a boat."

We do not like to discourage anyone, but we are inclined to believe that this "vacuum process" has more effect on the pockets of the inventor than on the gravel. It will go down to bedrock in one way; and will find the bottom of a pocket in a pair of breeches better than a pocket in the bottom of a river. In other words it is "no go."

The machines which have been tried—not used—in California rivers, have never accomplished anything. Of all the kinds of dredges tested, the vacuum dredges have been the greatest failures. They make a big noise, take a great deal of steam and coal, pump up some water and mud, and a little gold. They have been tried in many places, and always with the same discouraging result. There are 3 or 4 of these "mining boats" laid up in the river mud that could be bought cheap.

This first attempt at this kind of mining was made some eight or ten years ago on the ocean beaches off Gold Bluffs, on the northern coast. Pumps were rigged which were to draw up the sand and gold from the bottom of the ocean. This was tried several times, but in each case a failure was the result.

A few years ago several "mining boats," or dredgers, were built for work up in the Feather river. Several different plans were tried, but each proved a failure. Every now and then some one, ignoring the experience of others, starts up a scheme for getting gold out of river

bottoms. We have never been able to chronicle a success in a single instance. Some little gold is taken up to be sure. The writer has a friend who carries a pocket piece, a little two-ounce nugget brought up by a vacuum dredger from a river bottom. It cost him several thousand dollars, however. If gold can be taken out of the Missouri and other large rivers in Montana by any such means, then the managers of the scheme can come to California and make some money in showing us how to do it.

News in Brief.

THERE was a heavy frost in Virginia on Monday night.

RUSSIA has ordered a survey of the entire coast of Corea.

THE Turks are concentrating a large number of troops in Smyrna.

TRAINS have been blocked in western New York by ice and snow.

TEN THOUSAND Chinamen are about to leave Cuba for New Orleans.

THERE is a breach between the priesthood and the Irish Land League.

GERMANY is considering the question of reducing the duty on grain.

THE Canadian Pacific railroad is being pushed forward with great energy.

SEVERAL vessels were lost during the recent storm on Lakes Michigan.

DON CARDILLO BARERO, President of the Republic of Paraguay, is dead.

A deadly cattle plague has broken out in Eastern Washington Territory.

Nor the slightest sign is yet made at Constantinople of ceding Dulcigno.

THE snowstorm in Iowa, Nebraska and Dakota has caused the loss of much stock.

HARTMANN, the Nihilist, asserts that there are 13,000,000 organized radicals in Russia.

AFFAIRS in Colorado still have an ugly look, and a conflict with the Utes seems imminent.

A REPORT has reached Berlin that the Czar intends to abdicate in favor of the Czarowitz.

THE leaders of the Land League in Ireland are to be prosecuted by the British government.

THE Emperor and Empress of Germany were enthusiastically welcomed at Cologne on Saturday.

FIVE steamers are to be built on the Clyde for the new French company to trade with the United States.

WHILE traveling in the stage from Bodie to Carson, one of the passengers shot another for crowding him.

BERRY, the Indian Agent, who escaped from the Sheriff, is in the Indian camp and protected by them.

R. R. PARKISON, the well known Nevada newspaper man, was robbed by a footpad Thursday night.

OWING to a belief that the government intends to prosecute the agitators, a lull has occurred in the Irish agitation.

On the 9th, the Emperor of Russia was married to the Princess Dolgorenski in the chapel of the Imperial Palace.

THE Secretary of the Interior has taken active measures to avert from Colorado the calamities of an Indian war.

THE Bonapartists have united on Prince Victor Napoleon as heir to the throne, to the exclusion of his father.

BYRON BLAKE, a madman, murdered his mother, sister and stepfather and then hanged himself, in Wheelock, Vt.

FIVE million salmon eggs from California have arrived at Chicago, for distribution among the different Fish Commissions.

THE Western Railroads are fighting among themselves, and it is thought the fight will involve all the Eastern branches.

JOHN A. WOODWARD, Cashier in the Treasury Department, has disappeared from Boston with \$82,000 of funds not his own.

TWENTY-NINE missionaries from Salt Lake arrived in New York on their way to Europe, in the interest of the Mormon faith.

THE negotiations between China and Japan in regard to the Loochoo question have now entered a phase promising peaceful solution.

THE Italian laborers on the Cape Cod canal have taken possession of Sandwich, Mass. Police have been sent to the town to restore order.

THE Porte requested the Ambassadors to conciliate the Albanians with money and decorations. The Chief of the Albanian League has been raised to the rank of Pasha.

THERE is great alarm among the managers of all the roads over the unpromising outlook, and dividends will be few and low. Fars have been reduced from Chicago to St. Louis from \$14.80 to \$6.

A BILL has been submitted to the Mexican Congress that churches and curacies now under the charge of foreign priests shall be restored to the dominion of the nation. This is a blow aimed at the Jesuits.

IT is positively known that Austria, Germany and France have resolved to hold aloof from Gladstone's coercive measures. A deepening dislike and distrust of Gladstone is beginning to be displayed throughout Germany.

AT Port Benton, Montana (elevation 2,754 ft.), the average temperature is about 42°; at Virginia City (elevation 5,286 ft.), about 40°; at Deer Lodge (elevation 4,768 ft.), about 42°; and at Fort Owen (elevation 3,284 ft.), 47°.

COLONEL W. B. THOMPSON, superintendent of this railway mail service, in his annual report, recommends an increase of \$100,000 in the appropriation for the postal car service, of \$50,000 for route agents, and \$75,000 for mail route messengers.

Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and either of them incline it to shed prematurely. AYER'S HAIR VIGOR will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and bunions. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brassy, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of tone it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

Australian Patents.

The attention of Pacific Coast Inventors is called to the benefits which may be derived from Letters Patent of the Australian Colonies. We invite correspondence from all who may desire full information on the subject. The geographical location of San Francisco gives an advantage in our favor over Eastern agencies, rendering it possible for us to transact business in much less time.

Send for our circular giving full information regarding Patents for the following countries: Victoria, New South Wales, Queensland, South Australia, Tasmania, New Zealand, East India, Etc., Etc.

DEWEY & CO.,

U. S. AND FOREIGN PATENT SOLICITORS,
202 Sansome St., San Francisco, Cal.

For Help or Employment

Call on C. R. Hansen & Co., a prompt, enterprising and reliable firm. Their New Female Employment Office, at No. 110 Geary Street, has never been excelled in this city. For help of all kinds, call on them, or write for information, or send your orders to the above address.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & Co.'s MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the PACIFIC RURAL PRESS, which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

Chew Jackson's Best Sweet Navy Tobacco

Some fine sunny offices (next to the PRESS office), to rent (at very reasonable rates), by Dewey & Co., at 202 Sansome street, corner of Pine.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

NOTICE I

Annual Meeting of Stockholders for the Election of Directors

Notice is hereby given that a meeting of the Stockholders of the North Noonday Mining Company will be held, in accordance with the By-Laws of said Company, at the office of said Company, Room 25, No. 310 Pine Street, San Francisco California, on Tuesday, the Second (2d) day of November, A. D. 1880, at one o'clock P. M., of said day, for the annual election of Directors, and the transaction of such other business as may properly come before the meeting. Transfer books will be closed on Friday, the Twenty-ninth (29) day of October, 1880, at three o'clock P. M.

W. M. J. TAYLOR, Secretary North Noonday Mining Company. Office—Room 25, No. 310 Pine Street, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill and Mining Company, SAN FRANCISCO, CAL., OCTOBER 9, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, Dividend No. Thirty-six (36), of Fifty (50) Cents per share, was declared, payable on Friday, October Fifteenth (15), 1880. Transfer books closed on Tuesday, October Twelfth (12), 1880, at 3 o'clock P. M.

W. M. WILLIS, Secretary. Office—Room 20, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company. Nevada Block, Room 37, San Francisco, October Fifteenth (15), 1880.—At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 60) of Fifty (50) Cents per share was declared, payable on Wednesday, the Twentieth (20) day of October, 1880. Transfer books closed until the Twenty-first (21) instant.

W. W. TRAYLOR, Secretary.

Lewis Consolidated Silver Mining Company.—Location of principal place of business, San Francisco. Location of works, Pioneer Mining District, Pinal County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Second (2d) day of October, 1880, an assessment, No. Three (3), of Ten (10) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 15, No. 310 Pine Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the First (1st) day of December, 1880, will be delinquent, and advertised for sale at public auction; and unless payment be made before, will be sold on Monday, the (20th) Twentieth day of December, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

J. W. PEW, Secretary. Office—No. 310 Pine Street, Room 15, San Francisco, Cal.

A. J. PLATE & CO., Guns, Pistols, Sporting Goods MILITARY GOODS AND REGALIA, HAVE REMOVED From No. 510 Sacramento and No. 325 Montgomery Street, to Nos. 418 and 420 Market Street.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

DEWEY & CO'S

Scientific Press Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

A. T. DEWEY, W. B. EWER, OEO. H. STRONG,

Cups for Engine, Machine and Shaft Bearings and Loose Pulleys. We furnish the Albany Compound (a solid), \$1 worth of which will last as long as from \$2 to \$10 worth of Oil, with no stop, and with ONE-TWENTIETH the ATTENTION required by the best Oil Cups.

If the Cups are not satisfactory, we will receive them back and make no charge.

The Cheapest and most economical Cylinder Cup. Can be instantly regulated to feed a few drops per minute, and the drops can be counted as they pass through the glass gauge.

Pure Winter Strained Lard Oil By every vessel from New York.

ALBANY SPINDLE OIL, Genuine West Virginia Lubricating Oil, SIGNAL OIL for outside lights of vessels, etc.

The Albany Lubricating Compound and Cups, the Albany Spindle Oil, etc., can only be gotten from us or our agents. Send for catalogues.

TATUM & BOWEN, 329 Market and 3 Fremont Streets, S. F.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

TATUM & BOWEN, 329 Market Street, 3 Fremont Street.

**STEIGER & KERR'S
CONTINUOUS DISCHARGE AND GRINDING PAN.**

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The pan of feeding is the same as in the stamp mill, either an ore feeder or a hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the **OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.**

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from **HERCULES**, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

SECURE PATENTS

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the **MINING AND SCIENTIFIC PRESS**. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. **DEWEY & CO., PATENT AGENTS.**

MOREY & SPERRY,

MANUFACTURERS OF

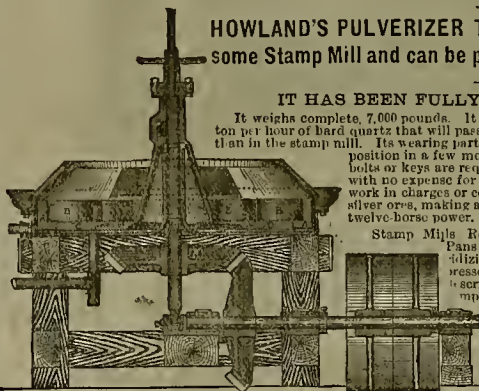

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores. Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also.

**SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

The Sherrill Gang Plow.

We illustrate on this page the Sherrill gang plow, a recently invented implement, which possesses many advantages, combining as it does several independent features in the one machine.

The plow has been specially constructed so as to ensure light draft. The line of draft strikes a little above the plow points, the draft bars being beneath the frame and axle, and directly attached to the diagonal cross bar to which the plow beams are connected. The independent motion of the plows, as hereinafter described, also tends to lighten the draft.

Each plow has an independent vertical movement, and naturally conforms to all inequalities of the ground, whether rolling or hillside, plowing all to uniform depth. On all planes its operation is the same, and performed automatically without adjustments or delays.

Below and in the rear of the axle is hung a diagonal cross-bar, to which the forward extremities of the plow beams are hinged, and which is adapted to move the plows collectively to or from the land by means of levers and connecting mechanism adapted to vary and maintain the cross-bar in any desired vertical adjustment. By moving the lever, therefore, and swinging the cross-bar, the whole gang of plows are moved to or from the land side more or less, as desired, and this without stopping the team or altering any of the parts. In order to allow of this motion, a second diagonal cross-bar, above and to the rear of the other, is employed, and to this the rear-arched portions of the plow beams are loosely connected by links, as shown in the engraving. This admits of the plows having a free vibratory movement in a lateral direction.

A lever is connected with this rear cross bar, and another with the front cross bar, the two being united to a third lever, as shown, thus admitting of simultaneous adjustment of the plows to or from the ground without altering the draft or interfering with the independent motion of the plows. The depth of cut is thus regulated, and the whole mechanism of the plows raised or lowered with respect to the frame, which itself always remains the same.

The plow beams, made of iron, are bifurcated at their rear ends; that is, they are split so that the wrought-iron standard of the plow comes between them. Each plow standard is pivoted by a bolt to its respective beam, coming between the two parts of said beam. The extended end of each standard is held by a clamp, so the standard is adjusted with relation to the beam. By the plow standard being thus clamped, the points of the plows can all be regulated to the same height, so any one plow can be prevented from "scraping" or dragging, a frequent fault in gangs. The plows are thus adjusted so they are perfectly natural and level on the bottom of the furrow.

The driver has no occasion, when plowing, to leave his seat to handle any lever. They are so easily handled that any boy can use them. The lever shown in the engraving in front of the seed box is not now placed there, the latest plows having this lever put nearer the driver's seat.

This plow is so constructed as to form three implements in one. Each gang has two sets of plows, one of five 8-inch plows, and another of four 10-inch plows, set to cut 40 inches wide. One of these sets is for deep plowing and the other for crossing summer fallow or plowing in seed. There is also a seeder, as shown in the engraving. Thus the implement is a seeder, cultivator and plow. In the seeder are peculiar agitators, which rotate and keep the holes clear so they cannot become clogged with straw. The size of the holes is regulated so any sized grain will go through. A peculiar wheel is used on this implement, all made of wrought iron—the rims, tires and spokes.

The plows can be raised or lowered by a simple and easy movement, while the plow is in motion and without checking the speed of the horses. The machine really forms a combined plow, cultivator and seeder. Its construction admits of its working on sidehill or level, and plowing to a uniform depth in rolling or uneven

ground. This is due to the independent action of the plows. Each plow works exactly the same as a single plow, and is independent of the motion of the others.

Dynamometer tests prove the lightness of the draft of the plow. It is so arranged that it is perfectly under the control of the plowman, and can be changed from deep to shallow plowing, or the plow thrown out of the ground, while the team is in motion, with the greatest ease. Each plow in the gang being independent and running on its own draft, allows it to readily conform to all inequalities of the ground, plowing uneven land to the same depth. The plows being hung below and independent of the frame, takes all strains from it and the wheels, and allows the wheels to impart to each plow a vibratory motion, enabling it to work through the ground with the least expense of the power, and do superior work. This plow is so arranged that the farmer can use four 10-inch plows for first plowing, and can readily change to five 8-inch plows crossing summer-fallow or plowing in grain.

We saw at the factory, Perry street, between Fourth and Fifth, in this city, the other day, a large machine carrying 12 8-inch plows, and arranged to cut eight ft. wide, with eight horses.

STRATIFIED CIVILIZATION. — Herbert H. Smith's "Brazil, the Amazons and the Coast" is the latest and the most trustworthy work probably on that country and its relations to the United States. Mr. Smith spent nearly four years in Brazil, and his account of the prospects

THE SHERRILL GANG PLOW, SEEDER AND CULTIVATOR.

of the American farmers on the Amazon is not encouraging. The export duties of the country are a great hindrance to its agricultural development. The great obstacle to social and political advancement is what Mr. Smith calls the stratification of society. "Our North American civilization," he says, "is not stratified any more than the ocean is. If men stay at the bottom it is by their own gravity and not by birth or station. The stratified condition never did hold in the United States; but South America imported it from Spain and Portugal, and has clung to it ever since as blindly as if it were an element of human progress."

An American missionary, Miss Norwood, of Swatow, has lately described how the size of the foot is reduced in Chinese women. It takes two years to form these "golden lilies," as the Chinese lady calls her delicate little feet. During the first year the pain is so intense that the sufferer can do nothing, and for about two years the foot aches continually, and is the seat of a pain which is like the pricking of sharp needles. With continuous rigorous binding, the foot in two years becomes dead and ceases to ache, and the whole leg, from the knee downward, becomes shrunk, so as to be little more than skin and bone.

SIR EDWARD DENNY is to make an interesting experiment on his Irish estates. He offers to grant leases forever to the occupying tenants on the Denny estates, and it is understood that the rents will be the same as those fixed in 1,829. It is expected that the tenants, who are generally in comfortable circumstances, will gladly avail themselves of this offer.

Statistics of the Public Lands.

In his annual report of the vast business of the General Land Office of the United States, Commissioner Williamson devotes large space to the important subject of reorganizing and increasing the present force of the department. From the statistical portion of the Commissioner's report, the *Railway World* has learned that there were surveyed during the fiscal year ending June 30, 1880, 15,699,253 acres of public lands and 652,151 acres of private land claims. This is an increase in the amount of public lands surveyed of 725,347 acres over that of last year. This great increase is attributed to the operation of the act of March 3d, 1879, which led to a great increase in the number of applications by private individuals for public surveys. Disposals of public lands during the year were made as follows: Cash entries, 850,740 acres; homestead entries, 6,045,570 acres; timber-culture entries, 2,193,184 acres; agricultural colleges, 1,280 acres; locations with military county land warrants, 88,522 acres; swamp lands patented to States, 3,757,888 acres; lands certified for railroad purposes, 157,375 acres. The area of public lands surveyed in the different States and Territories during the last year is as follows: Arizona, 308,521 acres; California, 3,792,630 acres; Colorado, 2,775,601; Dakota, 2,130,808; Idaho, 225,637; Louisiana, 80,504; Minnesota, 296,253; Montana, 302,413; Nebraska, 709,179; Nevada, 928,694; New Mexico,

Ferguson Gold Mine.

Some short time ago we drew attention to the new machinery built in this city for this mine. It was specially designed to meet the peculiar requirements of the mine, and to take full advantage of the splendid water power furnished by the Merced river which flows past the property and forms its southern boundary. A capacious ditch, capable of carrying about 900 miner's inches of water, a mile and a half long, conveys the stream to a turbine wheel, whence the motive power is carried by an endless steel wire rope to the two air compressors. These have each two double-acting air cylinders, and are so arranged that they can be worked jointly or separately; and as one of the compressors gives power enough for the ordinary requirements of the mine, any inconvenience, in case of accident, is provided against. The compressed air is conveyed from the receiver in iron pipes to the pair of horizontal engines placed near the Ferguson shaft, which is sunk, below the main tunnel, 1,000 ft. in the mountain. These engines operate the hoisting works, which, specially arranged for the position they have to occupy in the interior of the mine, are singularly compact and powerful, and admit of the brakeman discharging the quartz from the kibble into the cars, which convey it direct to the mill. The pumps in this shaft are also operated by compressed air, of which an ample supply is furnished for rock drills, and also for ventilating the more remote workings in the mine.

The whole works are very complete and efficient. The motive power for the entire machinery is supplied by the Merced river, which, even in the driest seasons, runs a stream far beyond any possible requirements of the mine. The mill stands about 1,000 ft. from the mouth of the main tunnel. It is run by an overshot water-wheel supplied from the same ditch as furnishes water for the turbine wheel. It was erected two years ago, and has been thoroughly adjusted during the time it was necessarily idle, owing to the erection of the new hoisting works. It is intended to add 10 more stamps in the spring, thus doubling its capacity. The bodies of ore already developed in the mine and standing ready for extraction, and the fact that in the lowest level larger reserves of quartz, of excellent quality, than any seen in the upper workings, have been passed through, call for this increase in the milling power. The lowest level has been carried nearly 700 ft. north and south of the shaft, passing through in its entire length an almost unbroken chert of ore. Now that the new hoisting works are at work, the sinking of the shaft will at once be proceeded with, and these extensive reserves opened out for systematic working.

Some of the ore from the Ferguson mine (like that of its neighbor, the Hite mine) is exceedingly rich. Some time ago a parcel of about 50 lbs. of quartz was sent down for sale for jeweler's purposes. Over \$1,200 were readily paid for it; and we have just seen at Prof. Price's laboratory a similar parcel, not so rich, but carrying very heavy gold, and worth many thousands of dollars per ton. The Ferguson mine is one of the best developed and equipped mines in Mariposa county. Of its permanency there would appear to be no question; and of its profitable character, the owners appear to be satisfied, if one may judge from the outlay to which they have gone in erecting so complete and efficient a system of machinery and works.

THE Russian Technical Commission has reported in favor of the adoption of the metric system within the empire, and the report has been received with favor, especially as it is recognized that some radical change is absolutely necessary. Most European countries have adopted the system, and as the majority have voted in its favor, it is thought that an Imperial order will soon issue rendering it compulsory at the expiration of a couple of years.

THE FLOW OF GOLD FROM EUROPE. — In an article referring to the recent heavy shipments of gold from Europe to the United States, the *Philadelphia Ledger* remarks: This sustained course of exchanges with Europe is a full vindication of those who claimed that the return of gold in 1879 had more than an exceptional significance, and means a general change in favor of this country. It is a grave question what the future consequences will be to the industries and finances of France and the German States, whose resources have seldom hitherto been drawn upon to go off the continent altogether. It is an easier task to restore disturbed balances occurring between the European States, than between them and a country so remote as ours.

It is noted as a singular evidence that the potter's art is behind the age in the matter of labor-saving machinery, that the records of the United States Patent Office show that less than fifty patents have been taken out for improvements connected with the manufacture of pottery, of which less than half the number apply to potters' machines.

The Mining Laws.

Result of the Convention of Surveyors-General.

Below we present the work of the late Surveyors-General Convention, which will be found of considerable interest to our readers, particularly to the mining classes. The report is nearly complete, but the parts which are of interest only to certain localities have been omitted, such as provisions respecting surveys on swamp and overflowed lands and the like. Following is the report as adopted:

Mr. President: Your committee appointed to make suggestions to this convention has taken under consideration the "act to provide for the survey and disposal of public lands of the United States," submitted to the Congress of the United States by the Public Land Commissioners, beg leave to submit the following report in regard thereto, as suggestions for the action of this convention.

Amend Sec. 29 so as to provide that the Commissioner of the General Land Office shall have only the supervisory control of all surveys by general instructions, leaving all matters of detail and local administration to the Surveyor-General.

Amend Sec. 31 so as to read as follows: Copies of maps of survey on file in the General Land Office shall be made by the automatic system under the direction of the Commissioner of the General Land Office, and shall be furnished to any person applying for the same, at the cost of paper and printing with 25% added thereto, and all monies received for such copies of maps shall be covered into the Treasury of the United States.

Strike out in Sec. 33 the part, "And every Surveyor-General hereafter appointed," etc.

Add to Sec. 29, "And that the Deputy Surveyors shall have authority to administer the necessary oaths to their assistants."

Substitute for fifth part of Sec. 2,223 of Revised Statutes, with the amendment of making compensation of agents \$8 per day instead of \$5.

Substitute for Sec. 47, Sec. 2,230 of the Revised Statutes.

Strike out Sec. 49 and substitute Sec. 2,411 of the Revised Statutes with the amendment to make it apply to all surveying districts.

Strike out Sec. 50.

Insert in Sec. 53 the word "general," so as to make it read, "Under such general rules and regulations as may be prescribed," etc.

In Sec. 54 insert after the word "whenever," "Upon the recommendation of the proper Surveyor-General."

Strike out Sec. 55.

In Sec. 58 insert the word "mineral" "and pasture."

Add a section to read, the rates for survey shall be as follows: Lands not mountainous or covered with thick undergrowth, or heavily timbered, \$8 per mile of section lines, \$10 per mile of township lines, and \$12 per mile for standard, meridian and meander lines.

Lands, without heavy timber or thick undergrowth, or lands not mountainous with such timber or undergrowth, \$10 per mile for section lines, \$14 per mile for township lines, \$16 per mile for standard, meridian and meander lines.

Lands mountainous and heavily timbered, or covered with thick undergrowth, at such rate as the Surveyor-General may recommend, and the Commissioner of the General Land Office approve, not to exceed \$18 per mile for section lines, \$24 per mile for township lines, \$28 per mile for standard, meridian and meander lines.

Add a section to read as follows: Whenever special kinds of monuments are prescribed to be used in the public surveys, the cost thereof may, with the approval of the Commissioner of the General Land Office, be paid for out of the general surveying appropriation.

Questions Submitted by the Honorable Commissioner and Members of the Convention.

1. What, if any change is necessary in mineral surveys and monuments, and should not permanent monuments be provided for by appropriations for that purpose or from the appropriations for public surveys? Has the latter been done in any district? [Remark by the Commissioner: In California a deputy, paid from appropriation under Sec. 2,411 R. S., has been used to establish such monuments and the expense of the monuments paid out of contingent fund.] It is the sense of this convention that mineral monuments should be of a uniform size and according to a prescribed pattern to be adopted, and each monument should be paid for out of the appropriation for public survey; and that such monuments in various districts shall be connected by triangulation, and Congress be asked to make appropriations based on the estimates. It is the sense of this convention that the mining laws of the United States, as now existing, if faithfully and strictly carried out according to the circular of instructions issued by the General Land Office on June 10, 1872, and November 20, 1873, while susceptible of improvements, meet all ordinary requirements. That the faults of the present system are to a large extent faults of the administration, caused in many instances by the practice, grown up in the General Land Office of assuming jurisdiction over details, properly belonging to the Surveyor-General only, which results in such a division of responsibility that it is difficult to fix it upon one or the other in case of mistake. It is further the sense of the convention that Surveyors-General should require, as precedent to issuing instructions for the survey

of any mine, a strict compliance with the said instructions regarding locations, found on page 278, Copp's United States Mining Decisions, and in said circular instructions of November 20, 1873. It is further the sense of this convention that if said instructions of the General Land Office, found on page 278, Copp's Mining Decisions, and in the circular dated November 20, 1873, respecting Tunnel Rights, are strictly carried out, and that if compliance with such instructions is required prior to the order for survey being issued, it will prevent much litigation, and will result in doing away with much ground for complaint which has existed against present laws. It is the sense of this convention that legislation is required providing for the compulsory survey of all mining locations made prior to the act approved May 10, 1872, within one year, and canceling and harring all such locations unsurveyed after such time.

2. By what means can better work be secured under present laws regarding public surveys? It is the sense of this convention that such result can be accomplished by increasing the maximum rates for difficult work and by providing means for the rigid inspection of the work in the field.

3. Is there authority of law for establishing more permanent and expensive monuments and corners? It is the sense of this convention that the Commissioner of the General Land Office has authority under the law of prescribing the kind and character of the monuments to be used in the public surveys, and that if more expensive monuments, other than those heretofore in use are prescribed, he has the authority to order the same paid for out of the regular surveying appropriation.

4. What good results may be obtained by a thorough system of inspection, and if good results can be obtained, what amount of money for each district is necessary to pay for such inspection? It is the sense of this convention that 10% of the amount expended in each district for surveys is necessary to pay the expense of inspection, and that better and more accurate work will be secured thereby.

5. Are public surveys being made as fast as demanded by the progress of settlement, and could not a much larger area be surveyed annually by a slight increase of clerical force in the Surveyor-General offices? It is the sense of this convention that the public surveys are not extended as rapidly as demanded by the settlement of the country, and that it is to the best interests of the Government and the settlers that surveys should precede settlement instead of following it. It is further the sense of this convention that the public surveys should be completed in the several surveying districts as rapidly as practicable, and that it would be wise economy to provide the means necessary for the early completion of surveys in those districts wherein the public surveys are now nearly finished, so that the offices of Surveyors-General in said districts may cease as provided by law. It is the sense of this convention that appropriations for clerk hire and incidental expenses for the several Surveyors-General offices should be increased from 25% to 50% of the present appropriation, and that such increase would enable said officers to have a much larger area surveyed annually.

6. In what manner can the surveys be made within the limits of certain railroad grants where the law requires the cost of such surveys to be paid by the railroads, it being remembered that the Government retains each alternate section of the land, and that all the sections must of necessity be surveyed together? Is it desirable to hasten surveys within railroad grants to the end that the lands may be conveyed to the railroad companies, and hence become subject to taxation in the States and Territories where situated? If so, how is this to be done? It is the sense of this convention that every consideration demands the survey of such lands as early as possible, not only for the reason that the lands would thereby become subject to taxation, but, also, for the further reason that the grant practically operates to withdraw all the land within it from settlement as long as the land is unsurveyed, because the settler is unable to tell whether he is on land belonging to the railroad company or on public land. This uncertainty operates injuriously to the best interests of the country. The early survey of such lands should be compelled by legislation by requiring the companies to make deposits, the United States furnishing equal amounts for their proportion of said lands. It is the sense of this convention that legislation is necessary, providing, that whenever the railroad companies pay their proportion for the survey of such lands, an equal amount shall be placed to the credit of the surveying appropriation out of the treasury of the United States.

7. Is the price by law for surveying public lands enough to secure competent surveyors, who will perform the work according to law? It is the sense of this convention that with the present kind of monuments in use and present requirements, the rates are sufficient for certain classes of lands, but that the maximum rates should be much higher for difficult classes of work, as indicated in the proposed section of the Public Land bill heretofore referred to.

8. Should timber lands be surveyed into smaller sub-divisions than is now provided for by law, or by the custom of surveys, and be more permanently marked with the view to more readily detecting trespassers? If so, how should it be done and what should be the cost? It is the sense of this convention that this should be left to the sound discretion of the Commissioner of the General Land Office, who

should have authority, upon the recommendation of the Surveyor-General, to cause timber lands, where it may be advantageous or necessary, to be surveyed into 40-acre sub-divisions. No general rule would be applicable in this matter. It is as desirable, and more so, to have the boundaries in timber lands more permanently marked than other lands, as it would greatly facilitate the detection of trespasses thereon. It should be done as other public surveys, and the cost should be such reasonable allowance within the limits prescribed by law as may be determined by the Surveyor-General with the approval of the Commissioner of the General Land Office.

9. Is it desirable that public lands shall be surveyed under the special deposit system; are fraudulent representations made as to being settlers in the townships for which special deposits are being made; if so, what is the apparent motive for such fraudulent representations? It is the sense of this convention that if any fraudulent representations are made as to persons being settlers in the townships for which special deposits are being made, they are only isolated cases, and that the present instructions which require the affidavit of two persons to the fact of such applicant being a settler are simply sufficient to check such fraudulent representations, if any have been made; but that in any event the Government cannot suffer any injury thereby except in so far that lands might possibly be surveyed which it might not be necessary or desirable to survey at this time, but that such instances can only be of rare occurrence, and could not be carried on upon a large scale without detection. The only motive for such fraudulent representation that we can conceive of is, that some Deputy Surveyor who is anxious to obtain work may, in some instances, have induced persons to represent themselves as settlers when they were not so in fact.

10. If it is desirable to make surveys under the deposit system, would or would it not be for the interest of the Government to adopt that as the only method for making surveys? (Adopted as a good but not the only method.) Could this be done by making the certificates of deposit a legal tender for any and all lands not otherwise disposed of, thus in effect bringing into market about one section in a township, or about one thirty-sixth part of the land, the proceeds of which pays for the survey of the whole, would such a system be proper? It is the sense of this convention that if Congress desires to get rid of the expense of maintaining the offices of Surveyor-General at the earliest possible moment by completing the surveys at once in all the districts, it could easily be done by making certificates of deposit issued for the survey of public lands a legal tender for any and all lands not otherwise disposed of. This convention does not suggest such a system, however, for the reason that it would not be in accordance with the present policy of the Government in the disposal of the public lands, but respectfully refers the matter with this expression of opinion to the Department of the Interior and the consideration of Congress.

11. Should a new Surveying Manual be prepared, and if so, how can this best be done? It is the sense of the convention that the Commissioner of the General Land Office be empowered to appoint from this organization a committee to meet at a certain time and place, which committee may avail itself of necessary information from other Surveyors-General, and that under instructions of the committee shall frame a manual suited to the best interests of the service.

12. Should base standard and meridian lines be run over Indian and military reservations, and if so, is action on the part of Congress necessary? It is the sense of this convention that base standard and meridian and township lines should be run over Indian and military reservations, and that no legislation is necessary for this purpose, but that the Surveyors-General have the power and authority to run said lines over said reservations. (Also that such base standard and meridian lines shall cover all the land in States and Territories in squares of 24 miles as near as may be.)

13. Should Surveyors-General receive a fee payable from a special deposit fund for each mineral survey examined, whether approved or disapproved? It is the sense of this convention that considering the increased responsibility to Surveyors-General, as well as increase of onerous work entailed upon them by mining surveys, that they should be allowed to collect a fee of \$10, from each applicant for a mining survey.

14. Is it the intention of the law that Surveyor-General may hold from his apportionment a sum sufficient to make inspections of surveys made in the same fiscal year? If not, how can the expense of inspection be provided for? It is the sense of this convention that each Surveyor-General has the power, with the approval of the Commissioner of the General Land Office, to set apart a proper portion of his surveying appropriation to pay the expense of the necessary inspections in the field.

15. In some of the districts it has been the practice to specify particularly the townships and lines to be surveyed in the contracts. This practice is objectionable for many reasons. Why should not deputies have a contract to a certain amount, and give bond to cover that, and as the surveys are needed, the Surveyor-General can instruct the deputy what to survey? It is the sense of this convention that contracts with deputies should be for the survey of such lands as the deputy may be instructed to survey, with the rate specified, and a bond thereto

covering double the amount of the liability, and the deputy should then be instructed what townships or lines to survey under said contract. It is the sense of this convention that the rectangular system of surveys is the best that can be devised for parcelling of the public lands. That in order to combine the greatest accuracy with economy, it would be advisable to establish base, standard and meridian lines by deputy surveyors, under the direction of the Surveyor-General, at a per diem compensation, and all other and sub-division lines as now under the contract system. It is the sense of this convention that by these means all possible errors would be confined within comparatively small spaces, and that the surveys thus executed under these different systems would operate as checks upon each other, and this plan would combine both—all necessary accuracy and economy. It is the sense of this convention that in the estimates for survey under the special deposit system, 10% additional should be added to cover cost of examination in the field.

Respectfully submitted,

JACOB H. STEWART,
FRED. SALOMON,
THEO. WAGNER.

The following resolution was adopted by the convention:

WHEREAS, It is the belief of your committee, founded upon the nearly unanimous and common experience of the people and press in mining communities, in opposition thereto, had since December last, that Congress will not enact the mining legislation proposed by the Public Land Commissioner, and

WHEREAS, To amend said proposed mining legislation so as to meet the views of your committee, would require the preparation of substantially a new bill, covering many details required in the procurement of patent to mineral lands, and

WHEREAS, Your committee cannot possibly prepare such a bill in the time at its disposal; therefore be it

Resolved, That it is the sense of your committee that the convention of Surveyors-General will best accomplish its duty in respect to the mining interests of the country at large by confining its efforts to pointing out needed changes in the mining act of May 10, 1872, and the regulations thereunder.

(Signed) ROSWELL H. MASON,
ALBERT JOHNSON,
A. J. HATCH,
JOHN WASSON.

This suggestion, submitted by R. H. Mason, of Montana, was unanimously accepted as the sense of the convention. It will be found of especial interest to the cattle men.

Submitted by Mason, of Montana. Although the matter of the sale and disposal of the public land has not been presented to this convention, yet as all matters pertaining to the public land laws are of interest to the members thereof, they desire to respectfully submit the following suggestion for consideration by Congress:

That pasturage and irrigable lands should be leased in large bodies for a term of years, and at a proper rental per annum, to parties desiring to use the same for grazing purposes; that said leases should contain a clause permitting all qualified parties to make homestead and mineral land entries and State land selections within the limits of the land embraced in such leases; and that at the expiration of such leases the parties holding the same shall have the right to purchase all that portion of the land upon which no entry or State selection has been made at a price to be fixed by law.

Commissioner Williamson congratulated the convention on the very satisfactory manner in which the business had been transacted. The members, one and all, expressed themselves as highly pleased with the associations and acquaintance among themselves which they had formed while engaged in the work they came here to perform. The result of this meeting cannot but be productive of good results in the near future. The country will then be ready to accord to these gentlemen their mead of praise and commendation.—Salt Lake Tribune.

MINING EXPERTS.—The Inyo, Cal., Independent gives the above class of humbugs the following pointed notice: There are on the Pacific coast, quite a number of so-called "mining experts" and "rock sharps," but who are knaves and humbugs—without principle or honesty, knowledge or experience in mining. These fellows are generally good, plausible talkers, and have any amount of cheek and assurance. They work themselves into the confidence of the honest and unexpecting capitalist who contemplates investing in mines, and they are sent out to examine and report. In many cases the report is favorable; money is invested, and after a practical working of the mine, it proves to be worthless, and the investor comes to grief through the ignorance of the expert. During the past two years some of these Pacific coast expert-humbugs, finding themselves too well known in California and Nevada, and, sending new dupees in New York and other Eastern cities, have "fitted out" for the Atlantic coast. Many a mining company has been swamped, and the prospects of many a district ruined by the ignorance and knavery of these spectacled frauds. Whenever they are mentioned, one familiar with them is forcibly reminded of the terse description given by the Nevada miner, who said a mining expert was a man who wore eye-glasses, talked Dutch, and didn't know a deuced thing about a mine.

MECHANICAL PROGRESS.

To Obtain Well Defined Castings.

To obtain sharper and better defined castings, Messrs. Thorp and Tesker, of Whitefield, Lancashire, England, enclose the mold or molding box within a chamber, in which a suitable degree of vacuum can be obtained, and they run in the metal in vacuo and afterwards admit air or gas into the chamber. In the apparatus they have devised for the purpose the molding box is enclosed in a metal chamber, which is provided with a lid or door, the meeting surfaces being planed or faced, so that a suitably air-tight joint is obtained when the door is closed, with or without the interposition of a joint ring or of backing, as preferred, or found to be most efficient. A shaft to carry a crucible or pot to hold the melted metal, passes into the interior of the chamber, and is provided with handles or with arrangements for tilting the said crucible or pot. A slight hole closed with glass, or two or more of such holes, is or are formed in said door or in any suitable situation in the walls of the chamber, so that the progress of the running in may be inspected. The said chamber is connected with a vacuum chamber, in which a degree of vacuum is obtained by means of an air-pump or of air-pumps, or by other suitable means. When the arrangements for the running are completed, the door of the molding chamber is closed, and the communication with the vacuum chamber is opened. The metal is then run into the mold, and air is admitted into the molding chamber. They prefer to use a two-way cock, which, when turned to shut off the connection with the vacuum chamber, opens a passage for the admission of air to the molding chamber. The last named chamber may be large enough to contain more than one molding box. They may connect said chamber directly with the air-pump, so as to dispense with the vacuum chamber, or employ the air-pump to increase the tension of the vacuum partly formed by the said vacuum chamber. In place of the crucible or pot being enclosed within the chamber they may pour the metal into a passage leading from the outside to the inside of the chamber, or into a container communicating with the interior of the chamber or with the interior of the mold, the atmospheric pressure forcing the metal into the chamber or mold, when a plug closing the passage is withdrawn or eased, or when the passage is otherwise opened.

Power of Windmills.

Windmills are apparently gaining in popular favor of late, but, at the same time, there seems to be a demand for reliable information as to their efficiency and power on the part of the purchasers. We have been unable to discover a record of any experimental determination of these data obtained from American mills. In the last century Coulomb made some experiments in France upon a Dutch windmill of four sails, each 35 ft. long and 6½ ft. broad, with good angles of "weather," and ascertained that when driven by a wind of 22 ft. per second velocity, an amount of work equal to a little above seven horse-power was performed.

The quantity of water raised by one of our best American windmills, accepting the manufacturer's statement as correct (which we have reason to do), shows that a 25 ft. velocity wind develops, when propelling a mill of 25 ft. diameter of wheel, 1.34 actual horse-power. This appears as a small result when the first cost of the mill is considered, but when the slight expense of running the mill is taken into account, the economy of windmills is more apparent. Besides, in the American mill, little attention has been paid to securing the best angles for the "sails" or blades, which would greatly increase their efficiency if adopted. In order to augment the efficiency and value of windmills, a series of careful experiments should be instituted, the results of which would furnish data for comparison and improvement.—*American Engineer.*

How to Fire Steam Boilers.

Mr. J. F. Tallant, in the *Milling World*, tells the amateur engineer how to fire steam boilers. He says: In placing a steam boiler in a furnace it is usual to employ grate bars, even for coal, about four ft. long, the same length that was necessary where wood fuel was used. The rear end of the bars should be at least the thickness of a brick, or upwards of two inches, lower than the front. The boiler should also be placed two inches lower at the rear than at the front, and the bridge wall should come within three inches of the boiler, if the draft is good.

The best grate bars now used are of a zigzag shape on the top, so closely placed that coal lumps upwards of one-eighth of an inch through cannot drop between. Three stoking pokers should be used—one a plain straight poker, another with claws, and another like a hoe. In firing, the coal should be so distributed as to be totally consumed without smoke, if possible. The more smoke, the worse the firing.

After steam is raised and work is fully begun, in replenishing the fire, the glowing coals should be pushed back with the iron hoe toward the bridge wall, and if any clinker is seen, remove with the claws. The fresh coal should be well scattered over the front, so that the smoke will

pass over the red hot coals and be consumed by them. Avoid making piles of coal on the bars. It is often beneficial to have a very small steam pipe open into the furnace, to give a spray of steam to the flaming mass. Water being composed of two most combustible ingredients, oxygen and hydrogen gases, when the steam is decomposed the heat becomes most intense. This pipe should be regulated by a cock, and it requires considerable skill, as an oversupply of steam will quench the fire instead of increasing it.

To permit a boiler to run too full of water is as wasteful of fuel as it would be dangerous to have too little. Of the two extremes, the latter is most common, generally through carelessness. To fire efficiently yet economically is a very skillful, intelligent operation, and the man who can do it and actually does it for his employers cannot be too highly esteemed by them, or be too well paid. Brains and vigilance as well as main strength and muscle must be used continually.

Sheet-Iron Roofing and its Advantages.

When made of first-class materials and properly put on, roofs of sheet iron are admirably adapted to withstand fire, wind, weather and accidental contingencies that affect the durability and quality of such coverings. Roof coverings of sheet iron are manifestly superior to many other forms. As compared with shingles they have the advantage of being far more permanent, free from the liability to the warping and shrinking which soon develop leaks in shingle roofs, and they are free from the fire danger to which the latter are notoriously subject. As compared with slate, which is popular in many quarters, a sheet-iron roof can be made more thoroughly storm proof, as the material admits of being fitted more closely and snugly to irregularities of the roof than the former; it is not liable, as slates are, to be cracked by frost, or injured by the falling upon it of heavy objects, and is free from the liability of cracking and splitting, which, in the event of a fire, often impairs the fire-protective qualities of a slate roof, and is especially manifested when cold water is thrown upon them while highly heated. As compared with tin roofs, those of sheet iron have all the advantages of the former, and in addition are made of heavier sheet, and the method of making the seams generally adopted in iron roofing dispenses with the necessity of soldering—one of the troublesome features of the tin roof. The seams in a tin roof are so small and narrow, that as soon as contraction of the metal breaks the solder the seams will leak. When iron roofing has not proved satisfactory, it can almost always be traced to a neglect of some important requirement. Much of the iron roofing in the market is made from a common iron, with very porous texture, and the surface frequently painted with inferior oil or paint having in it a large proportion of benzine driers.—*Manufacturer and Builder.*

A Petroleum Motor.

A correspondent of the *Manufacturer and Builder* furnishes that journal with a description of a novel motor that has been placed in a small United States steam launch, and loaned to the manager of the Exeter (N. H.) Machine Works for experimental purposes. This motor is known as "the Brayton petroleum engine," the motive power of which, according to the correspondent above alluded to, consists of a gas cylinder and air pump, placed longitudinally side by side, and connected to the same crank shaft. The power is originated by the combustion of petroleum oil in the gas cylinder, which is supplied with compressed air from a receiver, in which it is kept at the desired pressure through the agency of the air pump, the speed of the engine being increased or diminished by graduating the quantity of air introduced into the gas cylinder from the air tank. The engine makes about 300 revolutions a minute, and the main (or gas) cylinder is kept cool by water which circulates up through one piston rod and piston head, passing out through the other piston rod. On the shaft is a large spur wheel which gears on to the wheel that drives the propeller. The connection with the propeller shaft is one of the most ingenious features of the invention; the engine always moves in the same direction, whether the boat is going ahead or backing, the motion of the screw being governed by two cog-wheels, one of which it drives forward and the other backward; these are controlled by friction clutches, which are operated by air pressure from the tank. The propeller is under the direct control of the pilot, who governs its direction by means of a small lever located close to the wheel, so that the going ahead, easing and reversing are entirely independent of the engine. The motive power is obtained from petroleum, contained in a small tank forward, which is fed to the engine automatically as required.

CARE OF RUBBER BELTS.—When a rubber belt slips it should be lightly moistened with boiled linseed oil; animal oil will ruin the belt. If one application does not produce the desired result, repeat it until it does. The belts will be greatly improved and their durability increased by coating the surface lightly with a composition made of equal parts of black lead and litharge, mixed with boiled linseed oil and Japan enough to cause it to dry quickly; the effect of this will be to produce a finely polished surface,

SCIENTIFIC PROGRESS.

Some Facts About Jupiter.

The report of the Chicago Astronomical Society shows, during the past year, some good work done by Profs. Hough and Colbert on observations of the planet Jupiter. With magnifying power of 633 on the 18½-inch refractor, the disk of the planet was measured on eight nights by Prof. Hough and six by Prof. Colbert, the resulting values for ellipticity being respectively 1-16.23 and 1-16.73, sensibly smaller than Struve's value, though not differing much from other more recent determinations. The measure further showed "the figure of Jupiter's disk to be a true geometrical spheroid." Jupiter's belts were also carefully noted, and it was found that the middle of the great equatorial belt was subject to gradual change in its appearance between September 1st and November 1st. At first it was made up essentially of three separate belts, approximately of equal width; gradually it formed in two nearly equal portions, with a rift extending through a large part of the planet's circumference. The color of the equatorial belt was reddish-brown—brick-color.

The red spot was studied from September 3d to February 10th. Its color was similar to that of the equatorial belt, but brighter, and appeared sensibly the same when only partially on the disk as when on the center. The mean value of its length at the center of the disk was 12".73, and its breadth 3".56 for Jupiter's mean distance; the length appeared to vary to the extent of 2 seconds, and the breadth about the same amount; but owing to the irregular outline of the object, it was difficult to decide whether actual change took place, or whether the discordances in the measures were due to indifferent vision. By observations extending from September 25th to February 10th, the time of sidereal rotation was found by Prof. Colbert to be 9h. 55m. 34.2s.

A New Comet.

A new comet was discovered at the Ann Arbor Observatory, Michigan, on the evening of Sept. 30th. The next day a telegram was received from Europe announcing its discovery at Strassburg, a day earlier than at Ann Arbor. It is described as a superb telescopic object, just visible to the naked eye, but not growing any brighter as at first hoped. It has a large bright head with a sparkling nucleus, and a faint tail about two degrees in length. The head is nearly as bright, in the telescope, as the great cluster in Hercules. The tail points upward or away from the sun. It is moving about three degrees daily in an easterly direction, or nearly in a line drawn from Alphecca to Altair in the Eagle. It is a beautiful object, and its scientific value will be very great. When it first seen it was in right ascension, 14 hours, 8 minutes and north declination, 29 degrees, 45 minutes.

ELECTRIC FISHING.—An electric fish-hook has excited much attention and curiosity at the Berlin exposition. It is attached to a little skiff, which can be directed noiselessly toward any point of the water by means of a helix and wheel work. When reaching the desired location it anchors itself against wind and stream while the line and hook glide into the water. The skiff contains an electric battery and an induction coil, so arranged that the slightest hit completes the electric circuit. Immediately, with the rapidity of a flash, under the action of an electro-magnet, the line, hook and fish are raised into the air; a little bell rings to inform the fisherman of the capture, so that he can draw the skiff ashore and detach the fish.—*Les Mondes.*

INFLUENCE OF ELECTRICITY ON VEGETATION.—In hamboos the flow of sap takes place at the beginning of the rainy season, but vigorous shoots rarely grow before the thunder storms, which generally precede the harvest. The rapidity of their growth increases with the violence of the storm, amounting sometimes to as much as 70 ft. in 30 days, the vegetation being most active during the night. Capt. Sleeman suggests that the cause of this sudden growth may be the increase in the quantity of nitrogenous compounds, which are greedily absorbed by the humus that surrounds the roots of the hamboos. The facts offer a curious confirmation of the experiments of Dr. Siemens upon the influence of electricity on vegetation.—*Les Mondes.*

DEMONSTRATED.—Pasteur's theory that the formation of vinegar is a physiological phenomenon caused by the vegetation of a particular bacterium, *Mycoderma aceti*, has been apparently demonstrated to be correct by Herr Wurm, in experiments at the Breslau Institute of Plant Physiology. He has succeeded, according to report, in effecting the economical production of vinegar on the commercial scale, in accordance with Pasteur's views.

PHOSPHORESCENT LIGHTING.—Dr. Phipson takes sulphide of barium, or some other substance which is rendered phosphorescent by the solar rays, and incloses it in a Geissler tube, through which he passes a constant electric current of a feeble but regular intensity. He claims to obtain in this manner a uniform and agreeable light, at a cost lower than that of gas.—*Les Mondes.*

New and Interesting Stellar Observations.

Prof. E. C. Pickering, Director of the Harvard Astronomical Observatory, has recently made a discovery which is regarded as one of the most important in the history of the spectroscopy in regard to stellar physics. In the ordinary telescope a star appears as a point of light, brighter, but not larger than when looked at with the naked eye. Prof. Pickering finds that on placing a prism between the object glass and the eyepiece of his telescope, the light of a star is drawn out into a continuous band. When, however, the telescope with the prism is directed to planetary nebula, the light is collected into a star-like point without any hand, enabling the astronomer to distinguish immediately between a star and a planetary nebula. The difference in their appearance is so marked that the idea suggested itself that this device might serve to detect any minute planetary nebulae which could not otherwise be distinguished from stars. A systematic search was immediately undertaken, and on Thursday evening, Aug. 26th, an object was observed which presented the appearance of two star-like points within the band in the modified telescope. It is different from anything heretofore observed in the telescope, and is regarded as an important object for investigation.

In addition to this first discovery four other objects have since been discovered which are distinctly recognized as new planetary nebulae, one of which presents a very curious spectrum, two hands being seen near the ends of a faint continuous spectrum. It is difficult to know in what class to place this body, as it resembles a nebula in some and a star in other respects.

TO DETECT GAS IN MINES.—An ingenious instrument, termed a "spark tube," for indicating the presence of inflammable gases in mines, was lately exhibited and explained at the meeting of the Manchester Geological Society, by Dr. Angus Smith. The design of the instrument is taken from the old compression syringe used for igniting tinder, and the instrument consists of a small brass tube with glass let in at the bottom, which is closed up, and a piston and rod fitting closely in the tube. The air to be tested is taken into the tube either from the top or by means of a stop cock at the bottom, and the piston then rapidly pressed down with the hand, the compression of the air thus effected with the aid of spongy platinum causing the gaseous to explode inside the tube, the explosion being visible through the glass let in at the bottom. Dr. Smith stated that the presence of gas down to 2½% could be detected by the instrument, and as the explosion within the tube was perfectly harmless, he thought the instrument might afford a useful means for exploring gaseous mines.

SCIENTIFIC RESEARCH.—The industry, and sometimes eccentricity which guides scientists in the selection of their work is well known. An instance in point has just been brought to notice. Dr. George Thin is reported to have solved the moist and most unpleasant mystery of the cause of the peculiarly offensive fetid odor by which the secretion from the skin of certain people's feet is characterized. He finds it due to the development in the liquid, after secretion, of a micrococcus, which he names *Bacterium fetidum*. It is gratifying to know that the author has convinced himself that this organism and unpleasant effects which it produces can be destroyed by the proper use of antiseptics.

THE TELEGRAPH AS AN AID TO FISHERMEN.—From time immemorial the fishermen of the Mediterranean shores, of Cornwall and of the Scandinavian coasts, have been directed in their work by lookouts stationed upon cliffs to discover the approach of the finny schools. Of late the enterprising fishermen of Norway have called to their aid the electric telegraph, laying down more than 1200 miles of wire, to bring the fishers into instant communication with the watchers, and to notify the fish merchants where to go for supplies. The Norwegian coast gives employment to 40,000 fishermen during a large part of the year.

TECHNICAL BREVITIES.—A correspondent of the *Journal of Microscopy*, reports that he has had excellent success in mounting organic preparations in a preservative liquid, composed of two parts eucalyptic acid and one part borax, dissolved in half an ounce of glycerine, and then diluted with three parts of water. For very delicate preparations, the liquid should be diluted with more water.

INTEREST IN SCIENTIFIC RESEARCH.—Perhaps no more significant illustration could be found of the interest that is felt in scientific research, and of the activity with which scientific investigation is pushed, than in the single fact that at the late Boston meeting of the American Association for the Advancement of Science, nearly 600 new members were admitted.

ANNUAL RINGS.—It appears that the rings of trees do not always denote a year, for the blue gum tree of Australia sheds its bark twice a year. A tree recently hewn, that was known to be only 18 years old, showed 36 distinct rings of growth.

RECENT EXPERIMENTS by Piazzoli appear to establish the fact that the tenacity of iron increases on magnetization.

The Mining Share Market.

During the week a dull monotony has prevailed in the share market, and the only perceptible change was a tendency to the bottom. If the market closed in a languid state one day, it was a consolation to know that it would open weak the next. This morning (Thursday) the prices were lower than they have been for many a month, Union selling at \$11.50 and Savage at \$1.05. Is there no turn in the "dark lane" that leads to the Stock Exchange?

Referring to the condition of the market, the *Stock Report* of this date remarks that the hope of operators now is in the manner in which the market is being broken or being allowed to break. The general situation is very much the same as that immediately preceding the Sierra Nevada boom in 1878, and there is a particular similarity, of which our readers have probably taken no note or had no means of seeing. It will be remembered that the Sierra Nevada boom was ushered in by a Julia boom of no mean dimensions. There would seem to be something going on in that quarter of considerable importance. The operations in the market and the indications in the lower levels seem to foreshadow a movement in Bullion and Julia. Of what magnitude, of course, cannot be said, but everybody will be glad of some point on the Comstock in which to take an immediate and lively interest.

Bullion Shipments.*

Since our last issue, we have noticed the following bullion shipments:

Northern Belle, Oct. 18, \$7,570; Standard Con., Oct. 18, \$23,016; Christy, Oct. 23, \$8,470; Bodie, Oct. 24, \$11,980; Independence, Oct. 25, \$7,700; Idaho Gold Hill, Oct. 19, \$7,700; Northern Belle, Oct. 20, \$5,535; Star, Oct. 22, \$1,767; Mount Diablo, Oct. 23, \$7,827. At Salt Lake City, Oct. 18 to 23 inclusive—Ontario, \$36,092.17; Horn Silver, \$30,000; Tintic, \$4,756.04; Stormount, \$7,355.33; Christy, \$6,362.63; Barbee & Walker, \$2,353.24; Hillside, \$2,017.18; miscellaneous, \$76,476.71; total, \$167,413.30. Nevada county, for September—Idaho, \$45,000; Milton, \$30,300; North Bloomfield, \$15,600.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

IDA M. & M. Co.—Location: Arizona. Capital, \$10,000.00. Directors—J. C. Ayres, J. L. Murphy, A. Craig, G. Britton and N. J. Welch.

CALIFORNIA CENTRAL RAILWAY-YOSEMITE DIVISION.—Object: To build the Yosemite division of the California Central railway from a point on the Visalia division of the Central Pacific railroad in the vicinity of Madera, Fresno county, Cal., to a point near Fresno Plains. Capital, \$2,500,000. Directors—John C. Short, A. H. Washburn, Lyman Bridges, Samuel Miller, E. W. Chapman, F. Bridge and P. W. Johnson.

A NEEDED OFFICER.—According to the *Railroad Gazette*, a "Superintendent of Tree Culture" (Mr. Leonard Hodges) has been appointed for the St. Paul, Minneapolis and Manitoba railroad, and it is reported that he has already contracted for 300,000 trees. Most of the roads west of the Missouri, and probably most of those west of the Mississippi, might find profitable employment for such an officer, as their supplies of ties and timber are likely to become scarcer and dearer every year.

STEAM ON WALKER LAKE.—Walter Hamilton informs the *Gold Hill News* that he and J. F. Holland have a small steamer of 15 tons burden running on Walker lake, and that they are carrying freight from the head to the foot of the lake, a distance of 23 miles, for \$10 per ton. The road around the lake is 40 miles long, for freighting over which, teamsters charge at the rate of \$60 per ton. The little steamer makes eight hour trips. Thus far the transportation has been chiefly confined to railroad materials, but the public is beginning to use the boat for both freight and travel.

PARTIES IN SISKIYOU COUNTY, on Grizzly gulch, have found a rich quartz ledge just above placer mines which used to pay \$100 per day to the hand.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR. NEWTON COPPER MINE.—*Jackson Ledger*, Oct. 23: This mine—the only copper mine in actual operation in the county—is running steadily, although not on an extensive scale. Only one shift of six men is working underground. This force, however, is sufficient to keep the roasting pits fully employed. Improvements continue to be made on the surface, which indicate that the mine is prosperous.

PACIFIC.—The shaft of this Plymouth mine has attained a depth of 370 ft. The new hoisting machinery is being rapidly pushed ahead. The double engine, which is now being erected, is as fine a piece of machinery of the kind to be seen in the State. It is reported that as soon as the development of the mine has reached the proper stage, the building of a 60-stamp mill will be commenced, with stamps of 1,000 lbs each. When the 50 stamps of the Pacific are added to the 80 stamps of the Empiro, Plymouth bids fair to head the list of mining towns in the county.

ZEMES.—Chapman Watkins has

to 25 ft. In the south end the ledge shows an average width of 8 ft of fine ore.

NOONDAY AND NORTH NOONDAY.—The 212 level etopes have undergone no change since last report. The haul amount of good milling ore is being obtained from that level. The 312 south stopes are looking well. The drift on the east prong of the vein is opening up a fine body of ore. The north stopes, 312 level, are looking well and furnishing good ore. The No. 2 vein, North Noonday, 412 level, continues to show a fine body of ore as the stopes are extended.

BENTON IRON.—*Centennial*, Oct. 20: We were yesterday shown, by Gus Millard, specimen of ore sent to him by Supt. Will Adams, Jr., of the Indian Queen, which is a beauty. Squared, it would be about the size of a brick. It is 1 of 6 pieces taken from the full width of the ledge. The assays of the ore, of which this specimen is about a 6th part, reach \$3,000.

NEVADA.

MERCURY MINE.—*Nevada City Herald*, Oct. 19: The construction of the new works at this mine is progressing favorably. The hoisting works are nearing completion, and will, when finished, without doubt be the finest in the county. The new shaft, which has 3 compartments, is down over the timbered mine far down as 280 ft. in a most finished manner. Adjoining the 3 cage compartments is a small shaft for the pump rods, and at the side are 20-ft ladders, with platforms at the bottom, by which the pumpmen or miners can ascend or descend if necessary. The engine to be used for hoisting will be 180-horse power, and will hoist 1,000 ft in one minute. The latest improved cages will be used. The foundation for the 20-stamp mill is completed, and is expected to have it in running order early next spring. The old works continue to run in full blast, and some very rich rock is at present being taken out.

GARFIELD MINE.—*Transcript*, Oct. 20: This mine, in Washington township, is being developed with most satisfactory results. There is a large quantity of good-looking ore already on the dump, and much more of equal richness is in sight and ready for extraction.

CO. LORE TREAT.—*Grass Valley Union*, Oct. 21: The tunnel of this company has cut the main ledge, which is large and appears of fair quality. An 8-inch stringer, which is an overlay of the main ledge, has also been cut through, which shows well in free gold—nearly every place taken out showing the color.

SABASTOPOL.—Next week this company will commence a crushing of 200 loads of rock from the mine. This rock is from the shaft which was culled below the drain tunnel, and from the second, or lower level, where the ledge is of good size, and the appearance of the rock is excellent. There has been no crushing of rock from the Sabastopol since the mine has been re-opened by the present company, and therefore no estimate can be made of the yield of the rock per load, but it looks well enough to give a good result.

CENTENNIAL.—A clean-up of 60 loads of rock on Saturday last, from the Centennial mine, gave a yield of \$4,490, or about \$70 per load. The ledge in the mine is looking as well as at any time, being of high grade. The incline is now 55 ft below the third level, which is 520 ft from the surface, and will be sunk to the full depth of 100 ft, when a new level will be opened. In sinking the shaft unusual work has been incurred, and the Trustees have deemed it best to levy an assessment to pay off an indebtedness for labor which has accrued in consequence. This is only the second assessment ever levied by the company, and will amount to \$3,000, which will pay off all indebtedness.

EMPIRE.—This mine, on Ophir hill, has been drained of water down to the 300 level. The pumps have been at work for 4 months to accomplish this, owing to a large extent of ground that was opened in the drift and stopes. A number of tributaries are at work taking out rocks from the levels that are drained. The mine is to be pumped out to the bottom (to the 1200) and the incline sunk deeper.

NEW YORK HILL CO.—The balance sheet of this company for the fiscal month ending October 15th, shows a profit on hand, after the payment of a \$10,000 dividend, of \$46,085.80. The dividend receipts for the month were \$27,024.05 from amalgam, and \$2,833.70 from sulphurets, or a total of \$29,916.75. There is a probability of another dividend being paid before the close of the present month. The stock of the New York Hill Co. has been listed on the San Francisco Stock Exchange, and is now subject to call.

YUBA CITY MINE.—*Transcript*, Oct. 22: Operations have been partially suspended at this mine since last Monday to admit of a new 5-inch engine being put in to run the hoisting works. Heretofore one engine has been found sufficient for hoisting and pumping, but as additional depth is attained greater power is found necessary. It is expected that both engines and the 10 stamps in the mill will be started Monday. This mine appears to be in a very prosperous condition and to be well managed.

A VALUABLE LEAD.—John Orissell and Wilson Foster have a valuable quartz deposit that is located in the mountain between the Yuba and Lindsey claims, Washington township. Three or four years ago they extracted some of the ore and left it on the dump, but the lot was carried off by Chinamen and crushed in hand mortars. A tunnel has just been run, cutting the ledge at a greater depth and it is found at present, holding having been experts say the rock throughout the ledge as far as prospect will mill about \$80 a ton, which will seem rather incredible to many, but we are assured it is a reasonable figure. From 500 to 600 tons of the ore are stripped and can be extracted rapidly by blasting.

YULCAN MINE.—*Grass Valley Union*, Oct. 22: The perpendicular shaft of the Yulcan mine, on New York hill, has reached a depth of nearly 200 ft. Quartz stringers are found going downward, which indicates near approach to a ledge.

NOTE.—The new skip at the Scotia mine was put in operation on Monday, and works to a charm.

SARGENT & JACOBS' MINE.—*Transcript*, Oct. 23: This drift mine at Quaker Hill continues to look well. There is a quantity of ore at present, holding having been suspended, as the pump cannot otherwise be kept running. With the first storm that comes work will be in full blast again.

YUBA G. & M. CO.—*Foothill Tidings*, Oct. 24: This company, above Washington, on the Yuba river, is about to start up its mill, with good prospects of being able to produce a large quantity of ore. This is the first time the mill and machinery have been put in, and it is working successfully; the new machinery works perfectly satisfactorily. Active work is in progress, and the recent bonding of the mine to P. & F. Coffin, of New Britain, Conn., and other Eastern capitalists, has given it a great impetus.

NOTE.—A New York capitalist, one of the new owners of the Southern Eureka and the Atlantic & Pacific mines will have this week in the interest of the owners. They have given the Orenville Iron Works an order for a 10-stamp quartz mill, on which the foundry is actively at work.

OREN MOUNTAIN NEW MILL.—*Quincy National*, Oct. 23: On Sunday we took a look at the new 60-stamp mill recently built by the Oren Mountain Co., above Crescent. It is a splendid piece of workmanship, and when fully completed will certainly prove very satisfactory to the managers of the huge mine. Sixty 300-b stamps, in a straight line, driven by a powerful Knight wheel under a

pressure of 400 ft, will certainly add grandly to the producing capacity of the mine, and the beauty of it is that the mine has enough pay-ore already in sight to keep it, with the 32-stamp mill already in use, in full blast for several years, and a certainty of an insupportable supply in the mountain below the works. Particular attention has been paid to economy in handling the ore, and after it is dumped by the miners into the chutes it goes through the stamps without further handling.

ARGENTINE MILL.—Mr. Heath informs us that his Huntington quartz mill is now on the road from Oroville, and that it will be put up as soon as possible after its arrival. The prospects are that Argentine will soon be a flourishing quartz camp, and will show what can be done by the energy of one man.

NOTES.—Loring and Leavitt still continue to extract the big bluffs from their Elizabethtown claims. They have got on a splendid lead and will be rich in "less than no time." M. Brauford proposes to the old Crescent tailings by anastasia process. They must be rich, and the venture should be a paying one. Work is going briskly on at Cherokee, near Round valley, and a big mine will soon be in full blast.

SIERRA.

DUTCH CO.—*Downsville Mountain Messenger*, Oct. 23: John T. Mason, long of the American Co. at Morrisonville, has taken charge of the Dutch Co.'s claims, at Loganville, and will immediately put them in working order.

NEW MINING CO.—The Black Jack mining and smelting company, whose property is situated in Jim Crow canyon, in this county, has reorganized in New York. The capital stock is \$250,000, in shares of \$2.50 each.

TRINITY.

TAYLOR FLAT NOTES.—*Cor. Weaver's Journal*, Oct. 23: Here at Taylor Flat operations in the mine are at present suspended, owing to the scarcity of water.

ATLANTIC CO.—This company is making the necessary arrangements for a vigorous prosecution of the work as soon as water comes, and are extending the ditch for the purpose, I understand, of opening up ground hitherto unexplored.

ITEM.—At Cox's Bar matters and things are progressing quietly and satisfactorily as I could learn. Mr. T. Price is running his drifting claim with a full crew, and I presume with the usual gratifying results.

NEVADA.

WASHOE DISTRICT.

BELZONA.—*Territorial Enterprise*, Oct. 20th, gives these official statements: On the 3000 level we have cleaned out the south drift, repaired the track and air pipe, and placed a blower in the station, so that work in the face will be commenced to-morrow. The diamond drill holes will also be continued. On the 2700 level we are running east and south from opposite the station to connect with the drift formerly run on the ore streak. This connection will give sufficient indication to show roughly prospect that portion of the mine where the ore was found.

CON. IMPERIAL.—The east crosscut, 250 ft south of the north winze, is in 54 ft, face in hard porphyry. The drift north from south winze, 2135 level, is in 44 ft. Our pump station at 600 level caved in Friday, which interfered with running the pump. In the meantime the Belcher is taking most of the work on the 2900 level.

SAVAGE.—During the week the shaft force was engaged in main shaft repairs as usual. The incline force was engaged in repairing the head of the incline, and the drift force continued the driving of the 10th level drift.

GOULD & CURRY.—The joint shaft is down 1,745 ft; 25 ft having been added since last report. There has been no change in the formation passed through.

HUNT & BELZONA.—The joint shaft has attained a depth of 1,745 ft. The Con. Virginia joint winze is down 128 ft; 7 ft having been added in depth since last report.

SUTRO TUNNEL.—During the week ending Oct. 22d, the head of the south lateral branch of the Sutro tunnel was advanced 80 ft; total length of the branch up to that date, 2,000 ft. The head has now penetrated the Exchequer ground a distance of 320 ft. and has yet a distance of 44 ft to go in order to reach the head of the Alpha ground. The air there is excellent and good headway is being made, there being an average daily progress of over 11 ft.

AURORA DISTRICT.

REAL DEL MONTE.—*Esmeralda Herald*, Oct. 23: During the past week the shaft has been sunk 13 ft, making its present total depth 330 ft. A delay of 23 hours the first of the week was caused by the bucket coming in contact with an obstruction in the working barrel of the pump, necessitating the bucket rods, which had to be taken out and straightened. Men are now at work excavating on the 750 level for the placing of a bob at that point. The excavation will be finished by the time the bob is ready to be put in position, which will be in a few days.

GRAND TRUNK.—Col. Ellis says that the Grand Trunk is a good, square, paying proposition, and he ought to know. He has just had 10 tons of rock crushed, and is more than satisfied with the result. He also says that the pulion is 996 fine, and that is pure enough for anybody.

MOUNT GRANT.—We learn from E. W. Bennett that the men at work in the Big Injun mine, Mount Grant, recently struck a ledge 3 ft in width that assays \$300 per ton. Should the ledge prove permanent, the owners have a fortune in the Big Injun. Mr. Bennett also informs us that he intends shortly to ship several hundred tons of ore from this mine to Pine Grove, there to be worked.

CHERRY CREEK DISTRICT.

MAOIE MINE.—*White Pine News*, Oct. 21: We learn from Hon. E. B. Dickenson that while the owners were doing the annual assessment work on the Maggie mine, a fire broke out on the 200 level, and the mine was closed north and adjoining the Oeneva, and promises to be a valuable property when developed.

EXCAVATOR CO.—This company still continues to haul ore to their mill. Several hundred tons have already accumulated. The repairs on the mill are completed, and they have commenced crushing ore, and we predict that in a short time we shall be able to report an output of 100 tons of ore.

STAR CO.—The tunnel of this company is now in 600 ft, and is progressing finely.

EUREKA DISTRICT.

A GROUP OF RICU MINES.—*Sentinel*, Oct. 21: Following up the West Fork of New York canyon we ran into one of the richest groups in the world, the Ricu mines, California, Bully Boy, Helena Mortimer, Uncle Sam Con, Hamburg, etc. The Dunderberg ore-raising is done on the west side of the New York mountain divide, but from whence they get their ore is over near the Connolly ground. The Connolly hoisting works are placed in a chamber stowed out many ft under the surface. They will remain up the mountain as the first shaft is sunk next month. The two Jerry Sullivan, Bill Higgins and Mike Murphy have commenced work on a lease in the Dunderberg. Heretofore they have done well with the same layout, and now they are expecting to do even better. The Bully Boy offers very flattering prospects to someone who would try it on a lease. The last parties who worked it did well, and no doubt there are men who will win away money out of it this winter.

CALIFORNIA.—At the shaft-house we found George Mendes in charge of his brother's (Joe) property, which includes a belt of claims aggregating some 600 ft in width, and including a spot in the center of the ore belt that is undoubtedly very rich. The old tunnel cut by the shaft some 30 ft from the surface. Accompanied by George we wandered in past the mine's house in westerly direction, thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. Several trips have been run on this level, and the shaft 125 ft. In working out thence southwesterly to an upraise of 75 ft. This was filled with ore of a pay quality, which had been stoped down. Descending by a ladder to the 50-ft level, we found that another drift had been run in a southwest direction, striking the same ore body. Another drift downwards and we landed on the 136 level. The Black Knot on Plum and Cherry Trees.

We have had several essays of late upon the growth of the plum and prune trees in this State and mention of the diseases which affect them. It is conceded that the trees are far more healthy in this State than at the East. The attacks of the curculio have never been reported from California plum orchards. Another foe of the Eastern grower is the black knot. Two years ago an Eastern orchardist sojourning in this State informed us that he had seen this black knot upon plum trees in Kern county, but we were not furnished with specimens of the suspected material and cannot of a surety say that his observation was correct. If any of our readers in that county can either affirm or deny the statement, we should be pleased to hear from them. As the growth of plum trees is engaging general attention, we have thought it timely to present some facts about the black knot, showing its general appearance and minute structure, so that our readers who are not familiar with the evil, may be prepared to detect it if it should intrude itself in this State.

The appearance known as the black knot is produced by the growth of a fungus, *Sphaeria morbosae*. The knots, says Prof. Farlow, are black and vary in size from half an inch to eight or ten inches and even a foot in length, and are about two inches in circumference. In some cases they completely surround the branch on which they are growing, but more frequently they extend only part way round; their course, when very long, being usually somewhat spiral around the stem. If they extend completely or nearly completely around the branch the portion above the knot dies. Frequently the upper part of the stem bends over so as to form a right angle with the lower part, and sometimes the portion involved in the knot forms an irregular coil. The surface of the knot is undulated, and flakes of bark not unfrequently adhere to it. In winter it is more or less cracked and broken open, and the inside is seen to be worm-eaten and hollow, except the woody portion of the stem, which passes through comparatively sound, generally on one side of the knot. Below and above the knot, unless the branch above has been completely killed, the stem is swollen for from half an inch to two inches, rarely for a greater distance. Under the microscope, sections show that, although the bark has been cracked in several places by the expansion of the stem, yet a new layer of bark has formed over the exposed portions. An abundance of threads (mycelium) are seen extending in streaks from the inner bark, or cambium, to the outer bark, or cuticle.

To show the outward appearance and inner growth of the black knot, we reproduce drawings made by the microscopist of the U. S. Department of Agriculture. Fig. 1 shows the general appearance of the knot as attached to the branches and twigs in the manner we have described. These masses of black substance give the tree a most sorry appearance. In the summer they are to a certain extent hidden by the leaves, but in winter the wretched appearance of a plum or cherry badly affected by the black knot is a sight which no tree grower who has seen it can ever forget. When the disease is well developed it is also quite apparent in summer time, for there will project here and there through the foliage, the dead twigs and branches laden with these unsightly excrescences. Neglected trees are a painful sight indeed.

Fig. 2 is a cross section of the mass of the knot, and shows how the branch is embraced by its enemy. Fig. 3 is an enlarged view of the outer surface of the knot, showing the little cups or conceptacles of which it is composed; and Fig. 4 is a view of the knot cut in halves, lengthwise, so as to expose these chambers or cups in which the fungus growth proceeds. The cups are enlarged so that their character may be plainly seen, although the general outline of the knot is of natural size; that is, there would be in nature a vast number more cups in a knot of the size shown. Fig. 5 shows one of these cups taken from its place in the knot, in order to show its shape more clearly, and Fig. 6 is a highly magnified view of the same body, showing the manner of cell-growth which prevails in it. These cup-shaped bodies are the seat of activity in the knot.

We have refrained from giving a technical description of this disease, because the general notes we have made, together with the engravings, will be enough to draw the attention of growers to any such growth which they may see upon their plum or cherry trees. When the black knot is really found to exist in this State, if indeed such an unfortunate day should ever dawn, it will be time enough to enlarge upon the intimate life-history of the fungus. We

will merely add a few considerations concerning the treatment of the pest, if it should ever appear. Prof. Farlow, of the Bussey Institute, of Massachusetts, remarks that from the knowledge that the knot is a contagious disease, caused by a fungus whose ascospores are ripened in midwinter, and whose mycelium does not ex-knots, and hearing in mind that the fungus is indigenous on certain of our native species of Prunus, the remedy is obvious. When a knot makes its appearance, the branch should be cut off a short distance below the slight swelling of the stem, which is found just below the knot. The question arises as to the best time for cutting off the diseased branches. We should say, cut them off whenever one sees them.

Some of our readers, who have observed the growth of the knotty excrescence on their grapevines, will enquire whether that ill-growth is not like, in character, to the black knot of the plum tree which we have described. This matter is not yet demonstrated. Mr. Moore, in his report to the State Horticultural Society last summer, stated that he had not been able to find any evidence of the existence of the true black knot fungus, or anything akin to it, although he naturally looked for such cause to produce the effect upon the bark of the vine, which is so similar to the knot on this

THE BLACK KNOT (*Sphaeria morbosae*) ON PLUM AND CHERRY TREES.

tand for more than a few inches below the bark of the plum. So far, therefore, the likeness between the two evils, is one of outward appearance only.

In the case of the dissatisfied stockholders of the Phil Sheridan mine, Judge Allen this week issued to defendants, J. M. Hinkle *et al.*, an injunction preventing the payment of money to Treadwell, one of the parties interested, and restraining the sale of some 60,000 shares until a final hearing of the case. The plaintiffs, H. S. Stone *et al.*, filed an undertaking in the amount of \$7,000, and the case was ordered to be heard within a month.

On the original Keystone mine a new shaft is down 210 ft. The superintendent says he shall make ladders and place them in the pump compartment for general convenience and safety in case of accident; also sheath the compartment to keep the air current good for drawing off the powder smoke. Great care is being taken to make the timbering of the shaft strong and durable, thus avoiding frequent repairs.

The Grand Prize mill has been shut down for want of ore. Milling will not be resumed until the ore vein is opened in the 600-ft. level.

Ledge in the Tuscarora averages three ft. and assays from \$60 to \$100 per ton.

Mr. J. MACDONOUGH, the well-known capitalist, has been elected a member of S. F. Stock and Exchange Board to succeed J. P. B. B.

Land and Land Laws.

We notice that in some parts of the State there are wild ideas still outcropping concerning sharp and arbitrary laws to reduce the size of landholdings. They seem to take the form of a yearning after some incisive law which shall decree the division of land acquired by individuals in the bonest way of purchase. It does not appear just in what way such a division is to be brought about, but it seems enough for present purposes to shout it must be done. Such shouts probably serve a purpose, else why should one strain his throat; but we cannot see how any such movement could be carried on without direct conflict with the rights of property and individual freedom which are decreed by our laws and constitutions.

We have often urged the advantage of having our vacant areas peopled with industrious homesteaders and producers, and we have cited proof to show that this is now the tendency of affairs in this State. There is a vast area of productive soil which the owners are trying their best to dispose of in small tracts and at most favorable rates to purchasers. The agents of these land

shall not see enterprise and labor toward improvement increased, because the owners will find them forced to make the land pay for itself. This will relieve the pressure of taxation somewhat from the general productive property of the State and will assure all that a just system of distributing public burdens prevails.

There are many wise principles involved in land holding and in the making of land laws which should be calmly considered and the subject should never be made the material for demagogic cries. Great Britain has long been vexed by the systems of land ownership and land laws which there prevail. We have nothing in this country which can be compared with the laws of primogeniture and entail. Our hardships are much more transient. Judging by the progress for the last 30 years in land division in this State, we may expect that the lifetime of another generation will see us well out of the woods. There are, however, several directions in which legislation may move toward hastening the desirable result. Some of these may be seen in the propositions which the latest English writer on the principles of property in land lays down as matters which laws relating to land should embody, as follows:

- "1. Land, as the root of the wealth of the community, should be dealt with so as to evoke its maximum produce.
- "2. To this end there should be nothing tending to preserve it in the hands of a hereditary caste, whether of large or small owners, but every facility should be given for its transfer from those who cannot use it properly to those who can.
- "3. Any system which tends to make the labor employed on land not fully productive should be discouraged.
- "4. The application of capital, which is saved-up labor, should be encouraged.
- "5. Large estates, implying great wealth, and consequently less inducement to production, should not be an object of legal favor.
- "6. So far as experience may show that there is no moral or economic objection, the law should rather seek to promote the division than that aggregation of landed property."

These points it would do for land doctors to pin in their hats, for they will, it seems to us, be found to cover the courses of right in these matters. They will be found to lie about midway between conservatism and the modern radical ideas which are being promulgated, and in most agitations the truth lies about half way between the new and the old. They all tend toward an equalization of burdens upon owners of lands, and causing all lands to sustain their share of the support of mankind. If these be enforced it naturally follows that the land will eventually come into the hands of those who can use it best, providing this tendency is not checked by arbitrary laws. In this country there is no such check and the right movement in ownership will surely exert itself if conditions favorable to it are assured.

It is safe to predict that all mooted measures to divide land honestly acquired will fail; in fact, they will never get beyond the platform of the political orator, or the print of his newspaper and pamphlets. But the truer measures, those which proceed in equity to adjust existing inequalities with due reference to individual rights, will advance and accomplish the desirable results within their power. Let all things be done decently and in order.

THE LOCATION FIEND.—There is not a mining community on the coast that is not cursed by the Location Fiend. That the blackmailer is bad, there is no denying; but for tricks that are mean and ways

that are contemptible, the Location Fiend is boss. Like the coyote, he is ravenous; unlike the coyote you cannot scare him off. With a copy of Copp's handbook and a tape line, he roams abroad and woe betide the old stakes that may come in his way. You might build another Chinese wall around the 1,500 ft. of ground upon which you had been at work for years and congratulating yourself upon having a clear title if not a good mine. Try to sell your claim and you will find that the Fiend had been around and swung the northwest quarter of his "Whangdoodle" through your Chinese wall, and can bring 10 good citizens to swear that they had seen him put up the location notice of the "Whangdoodle" long before you were born. It never annoys the Location Fiend to be cramped for room. He has been known to climb up one side of a pine tree and down the other, with a tape line between his teeth, in order to get all of the 300 ft. on each side of his ledge that the law allows. The Location Fiend never works a claim. He is too busy for that. He is the first at a stampede and the last to leave. You could not get up in the night and put up a monument on a new discovery without finding the Fiend hard at work staking off extensions. Lynching cannot squelch him—he was never known to die; but we would suggest as the most effectual remedy for his extermination, the enforcement of the stumpage law. Compel the Fiend to pay stumpage for the timber he has destroyed in making stakes on the public domain, and a pine board would soon mark his last resting place.

I X L District.

The Eureka *Sentinel* has made mention, on several occasions, of the above mining district; of its convenient location, and the wonderful facilities nature has afforded for the expeditions and cheap working of the enormous quantities of ore there discovered. By the arrival of Mr. John Sullivan, who is largely interested there, the *Sentinel* is put in fresh knowledge of how matters are going, and what the prospects now are for that camp. Mr. Sullivan left that section about a week ago, and has been sojourning on business at different points along the road, thus being longer than is usually necessary in making the trip.

Although the camp is suffering from the drawbacks which beset every newly discovered mining section, Mr. Sullivan thinks that I X L is now fairly on the road to prosperity. Of the New Ten-stamp Mill,

Mr. Sullivan says that it is a "sure thing." The San Francisco parties who are interested in the outcome of I X L have offered to put in a 10-stamp mill which will cost not less than \$30,000, if the outside parties, mine owners and others, will raise one-half the amount. Chas. Kayser & Co. have guaranteed to take the balance of the stock, and Mr. Kayser expects the Eureka parties who are interested in the mines there to take their proportion. There are many parties living in Eureka who are interested, more or less in I X L, and Mr. Sullivan has come down to see what they will do toward the mill. Although he has been here but a couple of days, he says all the parties have signified their willingness to do their part.

The location of the mill has not been definitely decided upon, but it is to be conveniently situated for the benefit of the entire camp. Mr. Kellogg, who owns three very fine properties, the Black Prince, Nos. 1 and 2, and the old I X L mine, has contracted to furnish Black Prince ore for the mill to run on for three months, and getting the same out at his own expense, and if his management should not prove satisfactory, financially, he is willing to turn over his valuable properties in that district to the mill company. This is a fair, square proposition on the part of Mr. Kellogg, and signifies his faith in the wealth of the district.

Taking all advices from I X L, they agree upon this one thing, that there is enough \$30 croppings within 20 ft. of the surface on the Iron Point, Bayfield and Black Prince mines, to run a 20-stamp mill 5 years. The assertion sounds big, but we have been assured of it so often, and by so many different parties who have been upon the ground, that we feel no hesitancy in publishing it to the world as a fact. Another beauty of I X L as a camp of worth consists in the fact that a salt marsh is only 15 miles away, and salt in any quantity can be put down at the mill for \$7.50 per ton. At Grantsville salt costs from \$35 to \$37.50, and the ores do not average, with 50 assays made, as much as I X L ores, which run over \$40 per ton. And again, at the head of the salt marsh is a range of hills containing copper and the other minerals—in fact, all the chemicals necessary for the treatment of ores in that district can be obtained close at hand.

The Mines.

The Bayfield is being worked by two shifts. The hoisting works are run by whim—horsepower. They are running for the east wall from the 150-ft. level, and are taking out some of the finest chloride ore ever seen in the camp, which will be tested in body very soon. An average is now here in Eureka. They have now on the dump 250 tons of ore.

The Black Prince Nos. 1 and 2 is being worked. Just now they are sinking a shaft. The ore from this mine runs from \$130 to \$135 per ton, chloride.

Chicago parties are expected along immediately to look at the Spar mine. They are sinking a working shaft upon this property, and if not sold to Chicago capitalists, ore hoisting will be in order.

All the workings of the Annie Allen mine have developed a solid mass of \$30 ore. Jim Allen, of Eureka, owns this property, and it is considered a good one.

Wm. Cox owns a mine over there, with a 4-ft. vein of bromide ore, which assays all the way from \$60 to \$300 per ton. It is known as the Estella. Mr. Cox is taking out immense quantities of ore.

The Iron Point tunnel is in 200 ft. At a distance of 180 ft. from the face a vein of \$60 ore was cut, which was 3 ft. in width, upward of one-half being gold. The workmen stoped out a little chamber and filled up the dump—40 tons of ore, of the value we mentioned above.

In the East Star is found more lead than in any other mine in this district. The owners have 40 or 50 tons of excellent ore on their dump.

Town and Buildings.

The town of I X L district is Roseville, and it was so named from being located in Wild Rose canyon. In summer the gulch is a mass of wild roses, with plenty of water and nut-pine timber all about.

TOURISTS lately arrived from the National Park bring information of the existence of another group of geysers, approaching, though not equaling, in grandeur those already famous. They are situated about 30 miles south of the headwaters of the Fire Hole river, and though they have been reached by a few tourists, are not generally known among those who have heretofore visited the Wonderland.

USEFUL INFORMATION.

Lubricating Oil.

The lubricating qualities of an oil are inversely proportional to its viscosity; the endurance of a lubricant is, in some degree, proportional to its adhesion to the surfaces forming the journal. An ideal lubricant, in these respects, would be a fluid whose molecules had a minimum cohesion for each other, and a maximum adhesion for metallic surfaces. Viscous oils adhere more strongly to metal surfaces, hence it is obligatory to use such thick lubricants on heavy bearings. With light pressures more fluid oils are admissible, and, in all cases, the oils should be as limpid as possible. Oils with great endurance are likely to give great frictional resistance, and in the endeavor to save gallons of oil, many a manager has wasted tons of coal.

The true solution of the problem of lubricating machinery is to ascertain the consumption of oil and the expenditure of power, both being measured by the same unit, namely, dollars. In some experiments recently made with castor oil, the friction was so great as to throw off the belt driving the machine. In regard to that oil it can be said, that its friction is too great for lubricating purposes. Sperm oil, bleached especially for the test, showed almost identical results with the unbleached oil. The result of bleaching does not seem to affect the anti-frictional properties of the oil, although it undoubtedly reduces its gumming qualities.

The friction of sperm oil is subject to sudden variations, which occur at certain temperatures, for the same sample of oil. The explanation of this lies in the fact that sperm oil consists of a large number of varieties of spermaceti, each of which is liquefied at certain temperatures, at which the oil is relieved of waxy, or at least, gelatinous particles, and becomes a more perfect lubricant.

SOAPS MADE FROM WATER USUALLY THROWN INTO SEWERS.—At Ivry-sur-Seine, in the Rue Champs Blancs, a manufactory of toilet soaps has prospered for a considerable time. This soap, which is perfumed with oil of roses, is obtained from the treatment of washing waters in Paris, which, instead of being run into the sewers, is now collected in casks. A manufacturer, guided by the practical indications of the chemist, M. Pierre Beauvalet, treats the suds in the laundries themselves, merely the fatty matters in the crude state being conveyed to Ivry. The process is as follows: To the soap-water obtained from washing linen a little sulphuric acid is added. The whole is then stirred up, and the fatty matter is let stand for a few hours, when it collects on the surface of the liquid. It is then collected in casks like those used by water carriers. In place of sulphuric acid sulphate of iron or ferruginous sulphate of alumina may be used, by the action of which a separation of fatty matter is obtained, which is precipitated in the form of an insoluble soap. After the action of these metallic salts the operation may be terminated by the addition of milk of lime.

TO MAKE BELTS RUN ON THE CENTER OF PULLEYS.—It is a common occurrence for belts to run on one side of the pulley. This arises from one of two causes. First, one or both of the pulleys may be conical, and of course the belt will run on the higher side. Second, the shafts may not be parallel, or exactly in line. In this case the belt would incline off to the side where the ends of the shafts come the nearest together. The remedy in this case would be to slacken up on the hanger bolts, and drive the hangers out or in as the case may be, until the shafts become parallel. This can be determined by getting the centers of the shafts at both ends by means of a long lath, or a light strip of board.

COMPRESSING AIR BY FALLING WATER.—In the *Franklin Journal* Mr. J. P. Frizell, C. E., gives the results of some experiments in compressing air by means of falling water, which go to show that this method of employing water power is not economical or practicable. The effective power obtained by the experiments never exceeded 52% of what it would have been if the water had been used directly to turn a wheel. Mr. Frizell's formula applied to a fall of 15 ft. give only 76% of efficiency, and with a fall of 30 ft., only 81%.

CEMENT FOR JOINTS.—When rubber plates and rings are used for making connections between steam and other pipes, leakage of joints may be prevented by using a cement prepared by dissolving shellac in ammonia. The pulverized gum-shellac is soaked in ten times its weight of strong ammonia, when a slimy mass is obtained, which in three or four weeks will become liquid without the use of hot water. This fastens well both to the rubber and to the metal or wood, and becomes, by volatilization of the ammonia, hard and impermeable to either gases or fluids.

HARDENING GLUE.—The only thing that will render glue perfectly insoluble, is bichromate of potash. If you add a little of this in solution to the glue, and after applying the glue to the article expose it to the sunlight, it will become insoluble even in hot water. Better expose for a good while, say an hour or so, to make sure that all the glue has become insoluble. —*Boston Journal of Commerce.*

A New Use for Steel Scale.

Messrs. Henry Porter, of the Bowesfield Boiler Works, Stockton, and John Thomas, late of the Acklam Iron Works, Middlesbrough, have recently introduced in England, an invention which is worthy of notice on account of its utility. They have established works at Bowesfield for the manufacture of paint from steel scale, for the protection of steel and iron in any position and in any climate. English papers state that the paint is finding much favor, having been applied by such firms as Messrs. Bolekow, Vaughan & Co., the Carlton Iron Company, Messrs. Pease & Co., the Tees Conservancy Commissioners, Messrs. Kirk Bros., Workington, the Moss Bay Iron Company, Workington, and others. Mill scale was certainly not altogether wasted before, but it can now be made much more valuable. Messrs. Porter and Thomas obtain from the steel works in the locality, the scale that falls from the steel as it is passing through the rolls, and this, by their special machinery, they grind, until it becomes as free from grit as flour, and it is then mixed with boiled oil and coloring matter. Two kinds of paint are manufactured—the first for the use above water, to prevent the structures from rusting, and this is named the anti-corrosive paint; the second is for use under water, to prevent fouling, and is termed the anti-fouling paint. It is stated that a portion of Redcar pier is painted with the anti-fouling paint, and there it has given great satisfaction after several months' trial. The anti-corrosive paint answers for iron bridges, railway rolling stock, coal and iron plant, iron houses, etc., ships above water lines, boilers, engines, etc. Ordinary paints, when applied to iron and steel structures, soon begin to crack and scale off, and do not prevent the formation of rust, which is so destructive to the stability of metallic structures. The anti-fouling paint answers well for ships' bottoms.

UTILIZING MILKWEED.—A writer in the *Providence Journal* predicts a useful future for the milkweed, which has heretofore been considered only a cumber of the ground. Its seed yield a finer oil than linseed; its gum can be used instead of India-rubber; and from its floss, a fabric resembling Irish poplin has been made; while the young shoots are used in the spring by some people instead of asparagus, which they resemble in flavor. Now, pertinently adds the writer, if uses can be discovered for the thistle and whiteweed, they may prove friends in disguise.

GOOD HEALTH.

Health and Pure Water.

EDITORS PRESS:—Noticing an article under the heading of "Good Health" in your issue for September 4th, copied from the *Scientific News*, which would tend to confirm many individuals in the idea that any water was wholesome to drink, I would add my testimony to the importance of using only pure water—the result of experience and experiment of several years past. First—We lived on the dry plains of Tulare county, in good health, for five years, until the boiler of the engine that pumped water from our 80-ft. well was sent to San Francisco; after which, there being no way to pump the well dry (it being 12 ft. in diameter and 10 ft. of water in it), we continued to use therefrom until we all began to have attacks of chills and fever. We could not believe it was the water, as that appeared pure and sweet. About the same time the family of a neighbor, who had lived on the edge of the plains, in good health, for many years, was all taken with chills and fever, erysipelas and other troubles that continued with great severity until they, to prove that their well was clean, attempted to pump it dry, a work which, though it was only a 35-ft. well 35 ft. deep, required three pumps with a relay of men to work them.

After failing to get anything but an abundant flow of clear water, they were about to discontinue the work with the impression there was nothing but the clear gravel, which could be seen upon the bottom, to be pumped out. To demonstrate beyond question that there was no sediment in the well, my neighbor took an iron scraper attached to a pole, and after placing the suction pipe of one of the pumps close to the bottom, he began to scrape among the gravel whilst the pump was being worked, when to the surprise of all there came forth the head-smelling remnants of decayed vegetable matter, such as fig leaves, peach seed, and such things as would naturally get into an open well. After this well was cleaned they had good health again. I then put a Hooker pump close to the bottom of my well under the 10 ft. of water, and brought out yellowish green liquid enough to poison a large body of water, the extract from which had been causing our sickness.

When we moved to Kern county, near Bakersfield, a place notorious for malaria, we used, in common with others, water from a well bored into the surface soil, which extends very deep, and, like others, suffered with chills and fever until about two years ago, when we began boiling all the water used for drinking, since which

time I have only had one attack of chills, and this was brought on by the use of unboiled water taken for the express purpose of testing the effect of it.

I could say more, but space forbids. The result is that (though I know improper use of food, especially much carbonaceous food, in this warm climate, or overeating, will and does in many cases cause bilious fever, chills and fever, etc.) the most prolific cause is the use of impure water; and I would be almost willing to insure any one to have good health on this island if they would abstain from greasy food, temperately use a grain and fruit diet, and drink no water that had not previously been boiled. Two or three of us are experimenting upon this subject, and the past summer our friends have not failed to notice and compliment us on our appearance of improved health, though the medicine we used to depend upon we have not needed to call for.

I was glad to see the article you published, "Starved to Death by Overeating," and am glad to thus see some use made of Dr. Tanner's very valuable experiment.

ISAAC B. RUMFORD.

Bakersfield, Cal.

Injurious Effects from Vulcanite Plates.

Samuel Sexton, M. D., in an article published in the *American Journal of Medical Sciences*, for January, 1880, states that vulcanite plates produce diseases that are more frequently the source of reflex aurial disease than any others worn. They have been in use for over 20 years, and their adoption is very general. The constituents of this are caoutchouc, the sulphur required in the vulcanizing process, and vermilion or the sulphide of mercury, used for the color it imparts. The quantity of the latter ingredient is believed to be equal in weight to both the other substances mentioned; accurate knowledge, however, is withheld by the manufacturers. The gradual disintegration of these plates, as they are worn in the mouth, liberates a salt of mercury whose poisonous effects are well known. But besides yielding a poison, they are otherwise injurious to health. Inquiries from dentists elicit the fact that at least one-third of all those who attempt to wear them experience great irritation of the mouth, an irritation that is frequently accompanied by hypersecretion of the buccal fluid. The sufferer usually lays aside the plate until informed of the necessity of becoming accustomed to its presence by uninterrupted use. Vulcanite is a non-conductor of heat, and the effect of its contact with the highly sensitive tissues of the mouth is to produce hyperemia and inflammation. Another source of injury is the very close contact of these plates, which is maintained by atmospheric pressure and may favor the absorption of their substances. —*Medical and Surgical Reporter.*

THE VIRTUES OF BUTTERMILK.—Few people know, says the *Country Gentleman*, the value of buttermilk. A proper and constant use of buttermilk will entirely cure the constant craving for stimulants to which many persons, from long use, have habituated themselves. Have it handy and when the appetite says whisky or other stimulants, drink half a tumbler of buttermilk; the craving desire will be satisfied, and the stomach will be much benefited and strengthened, instead of weakened. There are many good effects from a free use of buttermilk. It alone will often cure sour stomach, and permanently. The lactic acid needed by many persons is supplied by buttermilk much more largely than by any other known food or beverage. One vital and important use of buttermilk is the prevention of valvular ossification of the heart, from which, in this country, so many persons die, especially old persons. There are many other peculiar so-called heart diseases which lactic acid, if partaken of freely, prevents. The so-called fluttering or palpitation of the heart, consequent upon a disordered, dyspeptic stomach, can be entirely removed by a free use of buttermilk. There are many other unpleasant feelings thus cured, all of which have their seat in the stomach—melancholy, the blues, etc.

SAFETY FROM DROWNING.—The Sheffield *Telegraph* says that the Rev. W. Cowell Brown, Wesleyan minister, of Sheffield, has patented an invention which appears to be a simple and practical means of lessening the number of deaths by drowning. A chemical preparation is inserted in a portion of the coat, waistcoat, or dress. It does not add to the weight or in any way alter the appearance of the garment. The preparation is inserted between the lining and the cloth; in the case of a coat, it is placed on each side of the breast and up the back. The moment a man touches the water the coat inflates and he cannot keep his head under the waves. The invention was practically tested at the swimming-bath of the Sheffield Bath Co. recently. The inventor states that his apparatus, which would simply form an additional lining inserted in a portion of the garment, would sustain a person in the water as long as he could possibly endure the exposure. For 40 or 50 hours it would be effective for its purpose. In the event of a person losing consciousness, the lining in the back would form a kind of bed, and that in the breast a pair of pillows, against which his head would rest.

Oscillating Stamp Mill.—F. A. Huntington, S. F.

The Week.

We are in the very agony of the Presidential contest, and little else is heard but the shoutings of the captains and the noise of the wordy tumult. The strife is conducted with unusual intensity in this State, and for the present every other interest is absorbed. As they are now carried on our general elections are not edifying occasions; indeed, it is a question if the fierce and unbridled license of the campaign, the crimination and recrimination, the iteration and reiteration of shameless charges, and the wanton and cruel denigration of character, are not more demoralizing to the community than all other sources of evil combined. Our electioneering methods are not good; they have too rank a flavor of savagery. For the sake of our youths we hail the day that shall bring a more rational and humane system of choosing our rulers.

Of course business is not active in the city, though the indications are favorable for a brisk autumn trade. The condition of the State is unusually prosperous, and warrants our merchants and manufacturers in expecting an active and general demand for goods. It is encouraging to note that the various industries of the city have revived greatly of late, and there is good ground for the belief that they will steadily improve.

Mining in the State is generally prosperous. In many of the counties where placers and gravel deposits abound, active preparations are making for the approaching season of rain and snow. Matters on the Comstock are unchanged, and so far as the public is informed, there is no present prospect of any development of a paying ore body in any mine on the great vein.

In Oro Blanco, Arizona, there is quite an excitement in placer digging. Men are engaged with sluices and other means in taking out gold dust. The placers are said to be rich. Long

The Mining Situation.

The depression of the Comstock mines continues; indeed, their condition appears to grow worse from day to day. For months the hope of the public was centered in the group of mines at the north end, where there seemed a fair promise of developing an ore body; but thus far the explorations have discovered nothing. It is true there is still reasonable ground for expecting a body of ore in either one of the prominent mines at the north end, but from the present indications the discovery, if discovery there shall be, is likely to be distant. The condition in Union Con.—in which mine until lately the situation was most hopeful—is thus described: At the top of the winzes on the 2500 level, there are strong streaks of quartz running to the eastward; therefore, on the 2600 these streaks must be looked for to the eastward of where the winze will come down. It is to the eastward that ore must be looked for; and some authorities predict that the winze will be in paying ore when it strikes the 2600 level. The explorations on the 2500 level show that the apex of the great curve of the vein will be found in the Mexican ground. In Sierra Nevada and Union the course of the ore channel is northwest and southeast, while in Ophir it is northeast and southwest. This well-known fact leads to the conclusion that there must be somewhere a sharp curve in the vein joining together the two parts explored. Already enough work has been done on the two sides to lead to the opinion that the big bend and basin of the vein will be found within the boundaries of Mexican. It is reported that Comstock miners of great experience have declared that it is the strongest place they have ever seen on the vein, both as regards the character of the quartz and the general formation, and they expect to see it develop a fine deposit of ore.

The central mines—Savage, Norcross, Chollar and Potosi—present little to excite hope of the discovery of ore bodies. In the meantime they are assessed with frightful uniformity. This fact and their apparent barren condition, together with the general distrust of their management, seems at present to have placed them outside the pale of confidence. While this is the true condition of these mines, a strike of paying ore in either of them would at once revive the hope of the public. The condition of the mines at the southern end, particularly Belcher and Crown Point, is apparently more assuring, although the information respecting their operations which is given to the common stockholder is meager and perfunctory. It must be said, however, that the managers of these mines keep the public well advised of the levying and collection of assessments. The punctuality with which this chronic tax is paid is highly creditable to the patience and endurance of human nature.

In view of this posture of affairs on the Comstock it is a matter of surprise that so little attention has been bestowed upon the mining property in what are known as outside districts. Conspicuous among these districts are Bodie, Columbus, Eureka and Tuscarora, to say nothing of the numerous districts of Utah, Arizona, Montana and Idaho. Several of the most interesting mining properties on the coast are now in the course of development in the district of Columbus, which has already acquired substantial prestige from the splendid developments of the Northern Belle mine. The output of the Bodie mines has been large, and, from the developments in a number of its mines, is likely to continue for years. Hitherto our capitalists have neglected these outside properties, and have permitted them to seek investors elsewhere. At the present time several of the most productive mining properties on this coast are owned in New York city and give tone to the operations of its share market. We need only mention the Ontario of Utah Territory, the Homestake of the Black Hills, Dakota Territory, and the famous Standard of Bodie in this State. These splendid mines have already disbursed millions in dividends. For example: The Ontario was placed on the New York market about three years ago, at \$20 a share, and has declared about \$30 a share in dividends; is now quoted at \$30; the Homestake, which was first called less than two years ago at about \$21 a share, has since paid nearly \$7 per share, and is now selling for \$34 per share; and the Standard which has declared about \$21 a share in dividends, \$12 of which have been paid within a year and a half, sold in New York city less than two years ago at \$20 a share, and now sells at nearly \$30. These three "outside" mines, without referring to others of scarcely less importance, present a splendid record, and are calculated to inspire confidence in fissure veins yielding either gold or silver. Evidently these mines have been worked on business principles, and have not been gouged to make a boom solely for the advantage of a few reckless manipulators. Their history, as will be seen from our brief mention, shows clearly that mining property, when selected with intelligent care and managed with ordinary prudence and fairness, is at once the safest and most profitable investment that capital can find. The outside districts, and no less the gold-bearing quartz regions of California, offer the most interesting fields for investment.

J. H. LORING, Elizabethtown, Plumas county, took out \$3,000 from one set of timbers in his flume, and one day uncovered 25 ounces of gold

Old Mining Camps Reviving.

The general depression of industry in this State for several years has led to one good result. It has compelled hundreds of men to leave the cities and towns, where they had been vainly waiting for something to turn up, and go into the mining regions of the coast, strip off their coats, and go to work in good earnest. Only the hard men are impelled to take these heroic steps. They may have made mistakes; fortune may frown upon them; but their native energy and good sense prompt them to efforts which sooner or later fetch some measure of success. Much of the activity which prevails in Arizona is due to the presence of this class of men, whose experience and discipline in the mining camps of California and Nevada have fitted them for thorough, intelligent and successful prospecting. The revival of the long abandoned camps of this State is due in a large degree to the depressed condition of business and the stagnation of the mining share market, which had the effect of filling this city with idle men. Idleness led to destitution. The brave and hopeful turned their faces and steps toward the mountains, where the rock-ribbed gold and silver would reward their industry and enable them to shake off some loose habits and mend their fortunes. Hundreds of men from this city drifted into the mining counties of the State, and sought to earn a living out of some long abandoned placer, or to strike a fortune by the discovery of a valuable vein of quartz. The result of these efforts has been an unwonted activity in the gold mines of California, and the promise of an increased production from both gravel deposit and quartz vein. The depression of business, as sharp as the ordeal has been to many, has not been an unmixed evil. It has led to the revival of an important industry of the State, and has been the means, let us hope, of rescuing numbers of young and active men from the pernicious habits which grow out of idleness and the disposition to get rich by reckless speculation.

It is evident that quartz mining in California is, as a general rule, in its infancy, and that the full experience and large methods of the Comstock will be applied sooner or later. When that shall be done we may expect results as splendid as they will be unprecedented. We learn from the *Virginia Enterprise* that Mr. W. B. Shepherd, late Superintendent of the Utah mine, has just returned from a trip to many of the old mining towns of California, especially in Amador county, where, in the vicinity of Jackson, he saw several very rich quartz mines. It is the judgment of Mr. Shepherd that men who have a little money would do well in the old camps high up in the mountains, along and just above the snow line. At the time of the excitement caused by the discovery of silver in Nevada, many Californians who were prospecting very promising quartz veins gave up their claims and crossed the mountains. Few of these men ever returned, and their old mines lie about as left. Mr. Shepherd was also told of many gravel ranges that promise well for placer mines, but went to see none of these. He is of the opinion that our Comstock miners, with their enlarged ideas of mining, will yet take hold in the old camps of California and develop some fine mines. In most places the old, stay-at-home miners of California are still working in the primitive style of the early days. On most shafts is still seen the old-fashioned windlass. Few of the miners think of setting up donkey engines, and hand drills and black powder are still used in sinking shafts and running tunnels.

Gold and Silver Coin in the United States.

The Director of the Mint has furnished to the *Engineering and Mining Journal* the following valuable estimate of the amount of gold and silver coin in the country, Oct. 1, 1880:

Gold coin in the country,	June 30, 1879.....	\$236,490,693 00
Coinage of the Mints (15 months).....		66,723,499 00
Net import of U. S. gold coin (14 months).....		16,666,806 00

Total gold.....\$369,881,003 00

Silver coin in the country	June 30, 1879.....	\$112,050,985 00
Coinage of the Mints (15 months).....		34,776,437 50
Net import of U. S. silver coin (14 months).....		2,971,913 00

Total silver.....\$149,799,335 50

Total gold and silver coin.....\$519,680,338 50

Uncoined gold bullion in the Treasury.....63,040,840 00

Uncoined silver bullion in the Treasury.....5,557,759 74

Total gold and silver coin and bullion available for coinage.....\$593,273,833 24

The total gold and silver coin (\$519,680,338.50) is distributed as follows: In the treasury—gold, \$67,204,293.65; silver, \$72,454,600; total, \$139,658,893.65. In circulation and banks—gold, \$302,676,709.35; silver, \$77,344,735.50; total, \$380,021,444.85.

The ores of the Wood river mines cannot be sent to market, says the *Salt Lake Tribune*, as there are no teams in that country to haul them away. This, in itself, is the best evidence of the prosperity of Montana, as all the large freighters are busily engaged on freight for that

Back Ledges—Unexplored Region of the Comstock.

Lying west of the Comstock proper there are many quartz veins of large size, known as "back ledges," the most noted of which are the Santa Rita and the Cole. Of these ledges and that unexplored region, the *Virginia Enterprise* says: The Cole has yielded a considerable amount of good milling ore in times past, and those best acquainted with the vein say that there are still to be obtained better assays than at present in almost any of the mines on the Comstock. This ledge is about 100 ft. in width. The Santa Rita is over 100 ft. in width, and shows a great breadth of quartz that assays well, and is of excellent grain and appearance. Indeed, the side of the mountain is full of ledges of various sizes, all of which show more or less metal, gold predominating.

It is not a little curious that the ledges to the west should so long have been left unexplored. Here and there, in working the mines on the Comstock vein, drifts have been run a short distance into the rock forming the west wall, but none of these have been pushed far enough to reach any of the back ledges. Some years ago the cry of "Go east!" was raised. Since that time everybody has been going east. All who had been at work on the west or back ledges at once ceased operations. Without any good reason, people concluded that no bonanzas would ever be found to the west of the Comstock. The tunnels and shafts that had been started were abandoned, and those engaged in prosecuting work upon them turned their attention to ground further east, and to the northward and southward. Thus, nothing more is now known of the ledges to the westward than was ascertained by surface explorations made years ago.

This being the case, it would certainly seem to be worth while to start a tunnel at some convenient point, and push it far enough west to cut several of the back veins. At least one tunnel should be so run. It might be done at small cost by several interested parties combined.

Such a tunnel could be started from any level of the Comstock that might be thought most favorable or convenient. Sooner or later a tunnel of the kind will be run, as one of these days our people will determine to see what is back in the mountains.

Several of the old tunnels that were run into the mountain to the west of the Comstock years ago, are now owned by the Virginia City and Gold Hill Water Company. Although not a drop of water is now flowing from them, for some reason men have recently been set to work at retimbering and putting the principal of these in good condition. As no water now flows from these tunnels, they are no longer of any use except for mining purposes. They would be useful for air and other connections, and as they are now being put in shape, it may be that a movement is being made to the west; indeed, for aught that is known to the outside world, a tunnel may now be well on into that west country—that *terra incognita* of back ledges.

A Patent Contest Ended.

A dispatch dated Washington, Oct. 22, 1880, says one of the longest and most bitter contests ever known in the United States Patent Office was ended yesterday by the issue of a patent to Richard F. Knox and Joseph E. Osborne, of California, for a process of reducing "mercury ores." The application for this patent was filed by Dewey & Co. in April, 1875, and the opposition to the inventors' claim has been constant and aggressive, both in the United States courts and in the Patent Office up to the issuance of their patent. The opponents of the patent have defrayed the heavy expenses of the long contest by eminent counsel against the issuance of the patent, as it covers a process for reducing the turras or fine ores of mercury, which is of great importance in the future of quicksilver production, and has already been largely used both by the inventors and by others, who will now have to arrange for its further use with the inventors, or stop.

During the progress of this case, we have associated with us some of the best legal talent in Washington, and the papers which we have on file in our office and in Washington relating to this case, will aggregate some thousands of pages.

The patent was received by Dewey & Co. and delivered to the inventors this week.

A QUARTZ ledge was discovered on Pine Creek mountain, in Union county, Or., on the 2d of Sept. There have been already six claims located of 1,600 ft. each. It is a well defined ledge, cropping out of a solid granite mountain, and contains galena, silver and gold. Some of the rock has been taken to Baker City, and assayed \$40 to the ton, and some to Union, which turned out \$100. The greatest excitement prevails over the discovery.

THE Salt Lake *Tribune* of the 23d inst. says that the mines bonded recently by Col. R. H. Rogers—I X L and Northern Light, Caribon, Idaho—are said to look well. The Northern Light has 9,000 tons of \$15 free-milling gold quartz in sight, and the I X L is developing

Home-Grown Tea.

Now that tea growing is being advocated as a home industry, and the wise in such matters urge the housewives in States where the tea plant thrives, to grow tea in their gardens as they do the fragrant herbs for kitchen use, it is of interest to note the part which the ladies of Japan play in tea production. Our engraving is taken from the Report of the Department of Agriculture, and was made from a painting by a Japanese artist, which was procured by our Government. The scene is in a foothill district, and shows several incidents of the Japanese method of culture. The employment of the ladies as pickers is, however, the chief point we would note. We do not know how these Asiatic ladies deport themselves while engaged at this task, but we submit that if the American housewife should marshal her home forces and go out into the garden for an hour's tea picking, there would be a merry time of it, and much enjoyable talking would be done while the leaves were gathered. Neighbors, too, could join forces and have fully as good a time chatting over tea picking in fine weather as they can tea drinking at other seasons. There could be just as much solid information of neighborhood affairs exchanged across a tea table. Perhaps if home tea growing were urged upon the ground of its social features, there will be unusual interest excited.

The ladies shown in the engraving very properly have a male assistant to do the heavy work for them. They pick in small receptacles and empty them, when filled, into the large hamper which is seen upon the left of the house. The melancholy individual who is running along the path on the lower ground with his baskets, is on his way to carry home the tea which the ladies have ready for him. The method of plucking the tea leaves is of interest, and may be of value to those who are now testing tea making with the plants now growing in this State. The smaller engraving shows that only parts of the main leaves are plucked for fear of injuring the new buds if the leaves should be pulled off at their union with the twig. Thus a woman plucks off the terminal leaves *a*, *b* and *c*, at the line marked 1, using the thumb and forefinger of the right hand. In Japan, the picking stops at this point, but in India, *d*, *e* and *f* are torn off part way down at the lines marked 2, 3 and 4. Thus the Japanese pluck three leaves and the East Indians six leaves. The operation of picking is one of great nicety and importance.

GROWTH OF AMERICAN RAILWAYS.—One of the most instructive statistical statements contained in Mr. Poor's latest volume will be found in the following tabulation, showing the growth of the American railway system from its small beginning in 1830 up to the close of 1879:

Year.	Miles in Operation.	Year.	Miles in Operation.
1830.....	30	1871.....	60,283
1835.....	1,098	1872.....	68,171
1840.....	2,818	1873.....	70,278
1845.....	4,834	1874.....	72,883
1850.....	9,821	1875.....	74,098
1855.....	18,374	1876.....	76,908
1860.....	30,835	1877.....	79,147
1865.....	35,085	1878.....	81,841
1870.....	52,914	1879.....	88,121

The railways of the world probably stand today as follows:

	Miles.
Europe.....	98,275
United States.....	88,121
Rest of the World.....	25,000
Total.....	209,396

The Philadelphia Record deserves great credit for its successful efforts to break up the sale of bogus medical diplomas, which of late years has disgraced that city. The fact was well known that "Dr." Buchanan and others were engaged in this nefarious traffic; but it was plied with impunity because of the difficulty of obtaining positive evidence of the sale of diplomas. This evidence the city editor of the above named journal by a clever subterfuge succeeded in obtaining; and the presentation of this evidence in court has resulted in the forfeiture of the charters of two of the diploma mills.

The "Jeannette"—Views of an Arctic Explorer.

A cable dispatch to the New York Herald from London, Oct. 25th, gives the following letter from Admiral Sir Richard Collinson, respecting the probable situation of the *Jeannette*:

"I do not think that there is much cause for anxiety. You may depend upon it that if Lieut. De Long reached Wrangel Land he would push as far north as he possibly could, knowing the value and importance of any observations he might make in this locality during the winter. In the event of an accident happening to the ship, we know he was only to cross a strait 110 miles wide to bring him to a kindly disposed people, who showed hospitality to the crew of the *Vega*. It would, perhaps, be desirable to request the kind influence of the Russian government. I do not think the westerly current, encountered by Tegethoff, will extend so far to the east, and if obayed by ice the *Jeannette* would make her escape by way of Behring's straits, where we know the ice comes

JAPANESE LADIES PICKING TEA ON A MOUNTAIN PLANTATION.

to the southward in great quantities. There is another condition for which it may be desirable to provide, viz., that the *Jeannette* failed in reaching Wrangel Land, and may have been induced to follow the opening caused by the equa-

who, dazed by the glitter of big assays, forget that high-grade ore is always scarce and extremely variable in both quantity and quality; and that it is expensive to mine since it occurs only in small veins, and is expensive to mill

METHOD OF PLUCKING TEA LEAVES IN JAPAN AND INDIA.

torial current to the north of Point Barrow. Had I been in a steam, instead of a sailing ship, there is no doubt I could have penetrated much farther to the northeast than I did in 1850. Should Lieut. De Long have taken this route, the probability arises that he may make his escape from the ice by the Mackenzie river. It therefore appears to me desirable that the Hudson Bay Co. should be asked to give instructions to their traders, who traffic with the Esquimaux, to announce that a reward would be given for information of the ship being seen on the coast."

since only a small quantity is treated daily. Ores of a low grade are far more uniform in quality and occur in infinitely larger quantities than rich ores, while the large amount which can be mined and milled daily reduces the cost per ton, and leaves, if not always a larger, yet usually a far more certain profit. As a general proposition it will be found that a mine yielding \$5 a ton net profit from a \$10 ore, is a safer and better investment than one yielding \$15 profit on a \$50 ore, or than one yielding \$50 profit on a \$150 ore.

A MINE ON FIRE.—The Austin Reveille, of Oct. 22, says a very serious if not fatal accident occurred at Wardell's mine, near what is known as Moor's Side-track, 12 miles east of Wells, on the Central Pacific road, on Wednesday. By some unknown means the timbers in the shaft, which is sunk to a considerable depth, took fire, and the shaft at last accounts was still on fire, notwithstanding the most strenuous efforts to subdue the flames. Three miners who were at work below are still in the mine, the shaft mentioned being the only means of egress from the works, and there is every reason to believe that they have perished.

MAIMOTH CASTING.—The largest casting ever made in this country was cast lately at the Black Diamond steel-works of Park Bro. & Co., of Pittsburgh. It was a solid anvil block, 11 ft. high and 8 by 10 wide, intended for a 17 ton steam-hammer, and weighed 160 tons. Seven hours were consumed in running the metal into the mold, and it will be four months before the casting is cool enough to move. The hammer will stand 34 ft. high, and will strike a blow of 20 tons. Its total cost was \$52,000.

BRANCHES of the Land League are to be established in England and Scotland. They are to demand a confederacy of the three Kingdoms in place of the Union.

Important Decision on a Mining Survey.

On the 27th inst. the Secretary of the Interior rendered a highly important decision in the matter of the surveys of the Beatrice and Monitor mines in California, claimed by the Ivanpah Con. M. and M. Co., on the appeal of Julius A. Bidwell from Commissioner Williamson's instructions of Aug. 16th to the Surveyor-General of California, and a letter recently prepared by the Commissioner, directing the Surveyor-General to approve and deliver plats of said surveys to the proper parties without further delay. The Commissioner, in transmitting the appeal to the Secretary, requested him to dismiss it and to approve the recently prepared letter to give explicit authority for him to dismiss all other like appeals, and to direct the Surveyor-General to refuse to receive any protest or appeal relative to the survey of a mining claim, except from the party entitled to such survey. The Secretary, in reply, holds that under his decision concerning the surveys of the Occident, Orient and other mines, in August last, no such appeal should have been accepted or forwarded by the Surveyor-General, if that officer had received instructions in accordance with said decision; but, having been received and forwarded, it should have been promptly dismissed by the Commissioner. He continues: "The practice of permitting adjoining claimants of persons not applicants for the survey in a case like this to protest, object, file evidence and appeal, where no case in which any question of their right of possession or to a patent is involved is before this Department for decision or final action, is, in my opinion, altogether wrong, and the sooner it is entirely discontinued the better it will be for all parties concerned. Very proper objections can be made in the survey when-

ever it is put or offered to be put in evidence in support of an opposing or conflicting right or claim. The anticipation of such objection before the plat is offered in proof or support of claims, seems to me a little worse than useless. I do not think it necessary for me to approve your letter to the Surveyor-General, for it is not at all likely that he will refuse to obey your instructions. I will say, with reference to letters of that character directing the approval of such surveys, that they are not to be considered in any way as decisions affecting the merits of the cases. They will not preclude objections to surveys presented in support of applications for patent or adverse claims, and the approval of surveys, by direction from your office, are not to be considered as having any more or greater force or weight than ordinary approvals of survey of mining claims by the Surveyor-General, without reference to your office or direction therefrom. I think that the decision of Aug. 9, 1880, in the case above mentioned, gives you full authority to do what you request me specially to direct in this matter. If special instructions to Surveyor-Generals themselves are deemed necessary, that decision is ample warrant for your issuing them."

A QUARRY OF VALUABLE MARBLE.—There may be seen at the hall of the State Mining Bureau, on Pine street, samples of marble from a large quarry on the bank of the North Fork of the American river, a short two miles from the C. P. railroad station, at Clipper Gap. We learn that the character of the quarry was determined by Mr. Henry G. Hanks, the State Mineralogist, who, while on a recent tour of observation in the mountains of the Sierra Nevada, saw the splendid deposit outcropping to the height of 300 ft. The owner had been thoughtlessly burning it for lime. An examination of the deposit led Mr. Hanks to pronounce it marble of a fine quality. The material is of a delicate dove color, beautifully mottled, and is easily susceptible of a high polish. The quarry is advantageously situated. The river flows at its base, offering an abundance of the cheapest power, and quartz sand abounds in the vicinity. With such rare facilities for the manufacture of marble wares, this fine quarry ought to be speedily utilized.

A LARGE cave has been found in the Blue Belle mine near Ward, Nev.

Candelaria.

A correspondent of the Virginia Enterprise, writing from Candelaria district, says:

This is without doubt the roughest and most uncomfortable mining camp in Nevada. The houses, what there are of them, are poorly built, and the cold wind that has been blowing for the past few days goes through them as easily as it would through a sieve. A great many people still live in tents. Wood costs \$20 a cord, and is scarce and poor at that. It takes a capitalist to keep a fire going here. Water retails at five cents a gallon, and is hauled in by wagons from Columbus—eight miles. This water is not very good, being impregnated with alkali, but the average Candelarian doesn't care much for that.

Pickhandle Gulch.

This is the name of the real mining town of the section, being located in the ravine directly below the mines. The people of Pickhandle, however, object to the name, and want it to be called Metallic City, after the style of the Slippery Gulchers, who insist upon Gold Hill, and the citizens of Pizen Switch, who are indignant if not addressed as coming from Greenfield. The Northern Belle hoisting works, the most important in the district, are about half way between the two towns. The town of Pickhandle is something like a mile from Candelaria, but the people get their mail at this place. Joe Pinschower, formerly of Virginia, carries the mail between the two places.

The Mining Interest

Has had a bad hackset by the way in which the Mt. Diablo has turned out. Great things were promised for this claim, but the ore which has come from it has not milled up to the standard of expectation, being only \$90 a ton, and the stock has consequently dropped from \$15 to about \$5. The people now say that there is not enough ore in the mine to keep the mill running two weeks longer, and the chances are that the people are right. There is another reason for the present depression. The Northern Belle Company, which virtually controls the camp and all kinds of business in it, seems to be bent upon giving the place a "black eye" upon every possible occasion. For that reason business men who would be willing to invest and help along, taking their chances with the rest, are discouraged and keep out. The Northern Belle boarding-house, away up the hill, is another deadener to the place. Every man in the employ of that company is compelled to board at that particular house, and to pay \$40 a month for his board, although better accommodations could be obtained at lower prices at other places. As a consequence, the men scarcely ever come down town in the evening, and as they have no inducement to bring their families here, the money which is paid out by the Northern Belle never gets into circulation here. Miners are paid \$4 a day in all the mines.

Dull Times

Are complained of by all classes of people. This is because everything is overdone. There are too many sellers and not enough buyers. But everybody is looking hopefully forward to the time when the railroad will connect us with the outer world. This is without doubt one of the camps to be benefited by the railroad. The teamsters who haul into this place do not stop over night, as they do in other places, for the reason that it would cost a small fortune to supply their mules with water. They either push on to Columbus or go back to Belleville, and thus the money they would drop here goes to benefit other places. The railroad cannot possibly hurt us, and will help us in many ways. This entire country is filled with quartz that will go from \$17 to \$53 to the ton, but, owing to the great expense of wood and water, it doesn't pay to mill it yet. When it will be possible to transfer this ore to Walker Lake at the cost of \$2 or \$3 a ton, you will see Esmeralda county loom up in the most surprising manner.

This is not a good camp for a man to come to with the expectation of getting employment. If any one intends coming, they should bring their own bed and blankets. Lodging and room rent are very high, though meals cost no more than in the Comstock. The restaurants set up very good grub.

The system of mining in Cottonwood has undergone a change for the better. Our people seem to have settled down to the opinion that mining is a legitimate business, and are acting accordingly. The mines are being thoroughly developed by tunnels, shafts and levels, and the mania for shipping every ton of ore as soon as exposed, is about over. The City Rock, under the management of Lem Colbath, was one of the first, if not the first, in this district, to start the reform, and now most of the mines are worked on that common sense and business sense principle. Little Cottonwood is not exactly booming, but it is in better tone and spirits than for years past.—Salt Lake Tribune.

Mr. GEORGE DAILY, whose departure from Leadville we recently chronicled, says the Boston Economist, is now on a visit to Boston, the guest of Dr. H. E. Townsend. Mr. Daily, as most of our readers probably know, is largely identified with the mining interests of Colorado. He is the consulting engineer of the Brittonstone group of mines at Alpine, the general manager of the Silver Mountain mining company's mines, at Ten Mile, and part owner in the Gilpin mining company, whose prop-

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores. Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!History, Development and Action; Classification and Com-
parison; Manufacture, Care and Use of SAWS of all
kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris
Exposition of 1878.This thorough work impartially written in a clear, simple
and practical style, treats the Saw scientifically, analyzing
its action and work, and describing, under the leading classes
of Reciprocating and Continuous Acting Saws, the various
kinds of large and small hand, ash, Mulay, jig, drag, cir-
cular, cylinder and band Saws, as now and formerly used for
crosscutting, ripping, scroll-cutting, and all other sawing
operations in wood, stone and metal, ice, ivory, etc., in this
country and abroad. With appendices concerning the details
of manufacture, setting, sawing, grinding, filing, etc., tables
of gauges, log measurements from 10 to 24 feet, and from 12
to 96 inches, lists of U. S. Patents on Saws from 1790 to
1880, and other valuable information. Elegantly printed on
extra heavy paper, wide margin, copiously indexed.
Owing to an increase of nearly 100% in the price of paper and
illustrations since first projected, the price is this date made
\$2.50, postage paid.

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia

March 10 1880.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arseniurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.This work is unequalled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or-
der. It contains 120 diagrams, illustrating machinery
etc., which alone are of the greatest value. PRICE, \$7.50ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without
Quicksilver. 1880.This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed full
of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country and in
Europe, and explains the why and wherefore.It contains 156 pages, embracing illustrations of furnaces,
implements and working apparatus.It is a work of great merit, by an author whose reputation
is unsurpassed in his specialty.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

DOUBLE-WALLED GLASS FISH GLOBES.—G. P. Ross and P. Vallejo, Bristol, Nev. Patented Oct. 19, 1880. No. 233,435. This invention relates to certain improvements in the construction of globes or transparent vessels which are intended to contain gold or other ornamental fish; and it consists of a doubled-walled chamber, having an intervening space or spaces within which various colored fluids may be placed, so as to give a peculiar or attractive appearance to the contents of the globe or vessel. By this construction the globes may receive any tint desired, either to correspond with or contrast with the tint of the room in which the fish are to be kept, and the fish or other contents of the globe or vessel will be tinged with the color used by being seen through it.

WATCH CASE.—Ferdinand Ephraim, Bodie, Cal. Patented Oct. 19, 1880. No. 233,405. This invention relates to an improved construction of watch cases by which dust and moisture may be prevented from entering the case and injuring the works of the watch. Much damage is done in a very short time to watches, carried by persons engaged in occupations where there is much dust, by fine particles of dirt which get between the cases and gradually reach the operative parts of valuable watches, and in a short time destroy the usefulness of the time-piece. This device consists in making a rim to which the cases are hinged, so that a groove is formed around the periphery of the cases outside, and this arrests the dirt and prevents it entering the watch.

CAN FILLER.—J. West, Westport, Oregon, and R. D. Hume, San Francisco, Cal. Patented Oct. 19, 1880. No. 233,449. This invention relates to certain improvements in that class of apparatus which is employed to mechanically pack and fill the cans in which meat, fish or other solid substances are hermetically sealed for the markets; and it consists in the employment of a carrying-belt, operated by an automatic pawl and ratchet whereby the material is carried forward into a chute, through which it is led to the shaping and compressing cylinder; and in combination with this chute, the employment of a pair of curved shearing knives, which cut the material to the exact cylindrical-shape necessary to enable it to enter the can.

AIR COMPRESSOR.—John B. Pitchford, Gold Hill, Nev. Patented Oct. 19, 1880. No. 233,432. In this air compressor the improvements consist in providing a peculiar cut or split metallic ring, having a suitable point and covering an annular discharge-opening, said ring answering for a discharge-valve or outlet for the air compressed within the cylinder, and closing by its own elasticity the discharge port so that the air shall only enter at the inlet valve or valves. By discharging the discharge-valve in the manner described, a large or free outlet for the air is obtained without the undue friction which would be incident to the working of a large slide valve.

PIPE COUPLING.—Eugene Riley, San Francisco. Patented Oct. 19, 1880. No. 233,434. This device consists in the formation of a hollow cylinder of wood of such an exterior size as to

fit within a sleeve, and having an interior diameter which will just admit the size of the pipe to be used. These cylinders may be burned or otherwise formed at the shop in quantity, and delivered at any point where pipes are to be laid, while the pipes and the exterior sleeves may be delivered at the same point in their ordinary condition, and without any previous preparation.

PROCESS AND APPARATUS FOR REDUCING MERCURY ORES.—Richard F. Knox and Joseph Osborn, San Francisco. Patented Oct. 19, 1880. No. 233,520. A furnace is provided for reducing fine or pulverized ore which will not choke up, and in which the ore is moved and stirred by gravity, while at the same time it is retained, the whole mass is divided into thin bodies, and is in a favorable condition to be effectively operated on by the heat.

PROCESS OF PURIFYING FATS AND OILS.—A. W. Winter, San Francisco. Patented Oct. 19, 1880. No. 233,453. This process relates to bleaching, refining and purifying of tallow, lard, oil, stearic acid and other dark animal oils and fats, and also of certain vegetable oils, in an economical manner, without the use of acids or any poisonous or deleterious chemicals.

A Deserved Tribute.

It is well known to most of the citizens of San Francisco that a bold attempt was made through the Legislature of 1878, to work an almost total confiscation of a large tract of land in this city by forcing upon the owners of said property a pretended "improvement" in the shape of an expensive and needless cut through the hills of the Potrero, to be known as Pennsylvania avenue. The work was similar in character, but far more costly and disastrous, and much less needed than the Second St. cut through Rincon hill. The efforts of the property owners most nearly concerned seemed to be unavailing to stay the progress of the work of spoliation, when Mr. Peter T. Seculovich, of 504 Stevenson St., set himself vigorously to work, and at much cost of labor, time and money, organized an association for the purpose of united action against this bold attempt at confiscation by outside speculators. Success finally crowned his efforts by securing the passage of an act repealing the infamous act authorizing said pretended improvement. The property owners interested made a substantial demonstration of their gratitude for the services of Mr. Seculovich, by coming together, at his residence, on the evening of October 11th, and presenting him with an elegant gold medal, a pair of gold-mounted pebble eye-glasses, a volume of the Legislative Reports, containing his act of repeal, and a copy of Webster's Unabridged Dictionary. The medal is a very costly and elaborate one, containing on the one side the words, "veni, vide, vici," with a farther inscription detailing at length the service done and the fact that the gift was from the members of the above named association. On the reverse side is shown the outlines of the North and South American continent, upon one side of which is a miniature view of Perasto, Austria, his native city, and on the other side the Palace hotel, as emblematic of San Francisco, with a ship wending its ocean way around the "Horn," by which route Mr. Seculovich reached this coast. The presentation was made by Mr. L. J. Hardy, a member of the Legislature, who took a decided interest in the act of repeal. His eloquent and fitting remarks were properly responded to by the happy recipient of the valuable and justly deserved gifts.

INDUSTRIAL LITERATURE.—"Spons Encyclopedia of Industrial Arts" is still appearing in parts of 60 to 70 pages each. Parts 12, 13 and 14, which are the latest issued, cover the following subjects: Coffee, cotton manufacture, drugs, dyeing and calico printing, electro-metallurgy and explosives. Each of these topics is the subject of a comprehensive illustrated essay by some writer who is practically conversant with the matter of which he writes. In fact, so complete and detailed are these essays, that each would serve well as a hand-book for those seeking knowledge of the specialty treated. When such treatises are collected into an encyclopedia, the result is a work which it would be hard to improve, and this is the quality we would accord to Spons' encyclopedia. We know of no work which contains so rich a store of varied information on industrial topics.

THE PRETTIEST DINNER TABLE.—At the Cincinnati exposition, the other day, a prize was offered for the prettiest dinner table, and it was given to a man who spread a round table about eight ft. in diameter for a dozen guests. The center decoration was a round plot of fern leaves with stocks of lily of the valley in the center; radiating from the ferns were star rays of pink laid on green, and between them were a trefoil, a horseshoe, a fan, a pipe, and a slipper in flowers. The huton-hole bouquets were of rosebuds and lilies of the valley, and the ladies' bouquets were of the same flowers. The table was covered with satin damask, and the glass, china and silver upon it were worth about \$2,000. The hills of fare were of tinted silk, painted with wild flowers and landscape panels.

The Nicaragua Ship Canal.

The irrepresible projectors of this scheme have just published in pamphlet form the report of the Executive Committee to the members of Provisional Inter-oceanic Canal Society on the present condition and prospects of the Nicaragua canal. Among other statements the report sets forth the following: As soon as the concession was made by the Nicaragua Congress this committee sent one of its members to London and Paris to confer with financial firms. Satisfactory interviews were had with many leading financiers of the world. It is generally conceded that subscriptions in this country of, say \$15,000,000, to the Nicaragua canal stock, and guarantees of protection by the United States, which, indeed, is fully provided for in the stipulation treaty with Nicaragua, would secure in Europe any amount necessary for the completion of the canal. Its comparatively small cost will enable the company to earn paying dividends upon rates of toll that would be ruinous to the Panama enterprise, without crediting any amount for passenger business, and without an allowance for the growth of business and population of this Pacific States in the interval of canal construction. We have found a traffic actually awaiting its opening, amounting to 3,706,426 tons, about most of which there is very little room for dispute or doubt, but the committee prefers to adopt 3,000,000 tons as the basis of estimates, while still omitting all passenger traffic, and not making reference to the valuable land grants. A charge of \$2 per ton for canal tolls, and of 50 cents for all other charges would give a business of \$6,000,000 received; \$75,000 for expenses of a business of \$6,000,000 net gain, or 8% on \$75,000,000. A business of \$2,000,000 would, after deducting for expenses, net nearly 5% on the capital invested.

California Mining District, Arizona.

EDITORS MINING PRESS:—On the eastern slope of the Chiricahua mountains, about 20 miles from the San Simon Station of the Southern Pacific railroad, is situated the above named district. It is crossed by three living streams of water, the banks of which are lined with heavy timber, suitable for smelting and lumbering purposes.

The Mineral Belt

Of the California mining district is about 6 miles wide and 17 miles long. The ores are copper and galena, smelting ores of high grade. Assays run from \$25 to \$1,600 per ton. A claim of high grade ore has been bought by a Pennsylvania company who are working the same with three shifts, and expect soon to have their smelter in full blast. The ores of this mine out of 20 assays gave \$400 as the highest, and over \$60 as the lowest, with an average of \$111 per ton smelting ore.

There are 10 men here now to where there was but one three weeks ago. Messrs. Kimbell & Son have an assay office; Messrs. Ryerson & Co. have a general merchandise store, at which point we expect soon to have a postoffice; Messrs. Bostich & Bro., a first-class blacksmith shop, and a weekly four-horse stage line to the San Simon R. R. Station every Saturday.

R. E. MACLEOD.

Oct. 24, 1880.

An Arizona Cave.

On Cave creek, in Yavapai county, a few miles above the ranch of an Apache chief named Modeski, there is a remarkable cave. A dense growth of dwarf cedar covers the ground in the vicinity and effectually conceals the opening of the cave. A trail so dim as to be scarcely noticeable, passes through this timber and leads to the opening which is about 24 ft. square. Crawling in a few ft. on your hands and knees, you suddenly find yourself in a chamber 50 ft. square and 30 ft. high. The cave is in a lime formation, and the water percolating for ages through the crevices in the rock, has covered the arched roof with stalactites clear as petrified icicles; drawn delicate traceries of fringe and curtain on the walls, and built up numerous stalagmites over the floor; one of which is as graceful and as beautifully proportioned as a Corinthian column. The most of these stalagmites are on one side of the room. There is one that attracts attention by its singular beauty and whiteness. One side of it is covered with scars, where it has been beaten by the Indian musicians while the beaux and belles threaded the mazes of some wild dance. Leading from this grand hall are numerous low passages which run in to other chambers. The cave has never been thoroughly explored so far as we know. It is known as Thorn's cave, and the legend is, that the man of that name, who a few years ago set the country wild with his stories of wagon loads of gold and silver, was imprisoned in it. Be this as it may, the cave, when fully explored, will prove to be one of the wonders of this wonderful land.—*Silver Bell.*

A SPECIAL permit having been granted to parties to work mines on the Fort Bowie military reservation causes much feeling among the old settlers there who have been refused the same privilege.

News in Brief.

THE Methodists have two orphan asylums in New Mexico.

LOUISIANA planters are contracting for Chinese coolies.

THE Manchester fire destroyed all the telegraph wires.

THE Pope, on Sunday, reaffirmed his right to the temporal power.

PERU and Chile have accepted the mediation of the United States.

SEVERAL squatters have been arrested in the Indian Territory.

GARIBALDI has declined Tennyson's invitation to visit him in England.

A COLORED man in Tennessee has given \$11,000 to build a church.

OVER 3,000 Chinese are employed near Lake Tahoe cutting wood and timber.

THE Ute Indians are running off horses, and a war is considered inevitable.

A GERMAN editor has received a severe sentence for libeling Bismarck.

THE Pope's new journal, the *Aurora*, 10 months old, has a circulation of 5,000.

THE Appletons will publish the memoirs of Jefferson Davis early in November.

ALL the coal oil in Quebec has been seized because it is under the government test.

THE Basutos have cut the land line of telegraph between Durban and Cape Colony.

TWO road agents were killed by Mexicans, northeast of Santa Fe a few days since.

THE authorities at Havana object to Chinese laborers leaving the island for Louisiana.

MR. DARWIN's works are to be issued in Russian by special arrangement with the author.

THE French Cabinet Council has decided to continue the enforcement of religious decrees.

At the Siletz Indian Agency, Oregon, there are over 150 members of the Methodist church.

THE whole number of the insane in Massachusetts is stated at 5,000, women preponderating.

It is said that among the ministers of the Church of Scotland there are many converted Jews.

THE *Beaver*, the first steamer that entered the Pacific ocean, was damaged by fire lately at Victoria, B. C.

A DEEPENING dislike and distrust of Gladstone is beginning to be displayed throughout Germany.

SEVERAL Pinte Indians near Winnemucca are making a success of farming. They raise grain and vegetables.

COUNT VON MOLTKE Oct. 26th refused the title of Prince offered to him on the occasion of his 80th birthday.

GEN. GARIBALDI and his son Menotti have withdrawn their resignations as members of the Italian Chamber of Deputies.

TWO wagon loads of venison arrived in Helena, M. T., on the 14th, and being the first of the season found a ready sale.

THE crew and the passengers of the *Mathilde Granville*, from St. Pierre for Granville, France, have been picked up at sea.

ELIAS SIMPKINS, Chief of the Pittsfield (Ill.) police, was shot and killed by Elliott Baker on Saturday night, Oct. 23d.

THE Goldendale (W. T.) *Sentinel* says a great deal of improvement is going on in that place and in Klickitat valley.

THE town of Kempen, near Crefeld, in the Rhineland, purposes celebrating the 500th anniversary of Thomas a Kempis.

THE body of a woman was found in the water at Chicago, Oct. 26th, with her infant child tightly clasped in her arms.

THE Puget Sound Salmon Packing Co. have closed operations for the season. They put up altogether about 3,000 cases.

M. LECOCQ, the composer of comic opera, is a diligent collector of old books, and has a special fondness for editions of Rabelais.

A MISSIONARY's wife wants the New Englanders to have old-fashioned apple-parings and send the missionaries some dried apple.

PHILADELPHIA has a sensation in the death, under suspicious circumstances, of the seventh wife of Michael Connor of that city.

CHILE and Colombia have agreed to submit their disputes to arbitration. The President of the United States is to act as umpire.

THE last Congregational minister deposed for doubts as to the eternal punishment of the wicked is Rev. Joseph Wassal, of Nora, Ill.

A FIRM in New York has been making a baby's outfit, for which is charged \$3,000, and has sent it home in two large wagons.

A DOG's head embroidered on the corner of a hankerchief is the thing to stick out of a gentleman's coat pocket for the moment.

THE cow boys threatened to stop the Presidential party at San Simon, N. M., but the train was run through the village and no trouble occurred.

THE Salt Lake *Tribune* figures that the average yearly hullion out-put in Utah for the past four years was a little more than \$6,000,000.

AT Woodland, Va., on Sunday night, Frank Allison shot his unfaithful wife and her paramour. He killed the man and fatally wounded the woman.

"BEWARE of Pickpockets," was one of the decorations on the wall before the eyes of members of the recent Pan-Presbyterian council in Philadelphia.

SECRETARY EVARTS is highly honored in church circles for his success in inducing the Turkish government to promptly avenge the murder of Dr. Parsons, the missionary.

By Universal Accord,
AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable, no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

FOR SALE BY ALL DEALERS.

Stopping the Paper.

If you don't like our paper, stop it. If we are not rendering you individually, or the community around you, or the special industry or calling you represent, an equivalent for your money, we don't want it. In fact, if for any reason you don't want to pay for the paper, you can stop it at any time by sending us word; not by telling the P. M., not by putting an unstamped letter in the office; not by sending back the paper (with or without your name) without your post-office address; but by sending us notice direct in a reliable manner. None need hesitate to subscribe for this paper for fear of not being able to stop it instant by the above directions. We know of publishers who have demanded the profession by persistently and obstinately neglecting to stop papers when ordered discontinued. Their acts are a hindrance, and we have been unjustly deprived of many good subscribers by the above named sin in publishers unworthy of their calling in more respects than one. We will offer a handsome premium on all subscribers who have difficulty in stopping their subscription when written notice is sent to this office.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), he sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove, walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with
Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when ad-
visable.

STEAM LAUNCHES, Barges and Steam Tugs con-
structed with reference to the Trade in which they are
to be employed. Speed, tonnage and draft of water
guaranteed.

STEAM BOILERS. Particular attention given to
the quality of the material and workmanship, and none
but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING
MACHINERY made after the most approved plans.
Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size
made in suitable lengths for connecting together,
sheets rolled, punched, and packed for shipment ready
to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and
Water Pipe made by this establishment, riveted by
Hydraulic Riveting Machinery, that quality of work
being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam
Winches, Air and Circulating Pumps, made after the
most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City
Water Works purposes, built with the celebrated Davy
Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received
for Quartz Mill Screens, and Per-
forated Sheet Metals of every
description. I would call special
attention to my SLOT CUT and
SLUT PUNCHED SCREENS,
which are attracting such at-
tention and giving universal
satisfaction. This is the only
establishment on the coast de-
voted exclusively to the manu-
facture of Screens. Mill owners
can contract for large supplies at favorable rates.
Orders solicited and promptly attended to.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

FRUE'S ORE CONCENTRATOR OR VANNER.
Plunger Jigs. Revolving Screens.
CRUSHING ROLLERS. SAMPLE GRINDERS.

FRASER & CHALMERS

Howell's Improved White Roasting Cylinders.
REVOLVING CYLINDERS AND ORE DRYERS.
Hoisting and Pumping Machinery.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in millwork and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

PACIFIC MACHINERY DEPOT.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

Which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and See Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

DUNHAM, CARRIGAN & CO.,

LIGHTNING SCREW PLATES

WITH TAPS, DIES AND COLLETS COMPLETE.

B, Stock 23 inches long, 7 Taps and Dies Cuts $\frac{1}{4}$ to $\frac{3}{8}$ inch.
C, " 26 " " 7 " " " " $\frac{1}{2}$ to 1 "
D, " 53 " " 6 " " " " $\frac{3}{4}$ to $1\frac{1}{2}$ "

No. 0. Lightning Hand Bolt Cutters and Tappers.

ESPECIALLY FOR CROOKED WORK!

Made to be bolted to the Bench or Table. Fitted with seven sizes, from $\frac{1}{4}$ to $\frac{3}{8}$ inch. Usual assortment, $\frac{1}{4}$, 5-16, $\frac{3}{8}$, 7-16, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ inch.

SEND FOR CIRCULARS, COMPLETE.

Nos. 107, 109 & 111 Front Street, San Francisco.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which we are prepared to sell at LOWEST RATES.

No. 1. Equaling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2. Will do the work thoroughly in all but the hardest kinds of rock.

No. 3. For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Caps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Rates.

VULCAN POWDER COMPANY,

Office, 218 California Street, - - - - - SAN FRANCISCO, CAL.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. $\frac{1}{2}$ Triple Force Caps and all Grades of Fuse.

SECURE PATENTS

Through Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Number 19.

Academy of Sciences.

At the meeting of the California Academy of Sciences held on Monday evening last, Mr. J. P. Moore presided. Dwight Whiting, Daniel Cook and Mrs. Ellen M. Colton were elected life members. The donations were by J. H. Sisson, "metate" found at Hawkinsville, Siskiyou county, nine ft. below the present surface. By W. F. Walmsley, of Beowawe, Nevada, one "fisher," dug up at a point in Nevada, 25 miles from Beowawe. By J. Barker, Sumner, Kern county, a lot of fossil eel teeth, found in sedimentary deposit at Rio Brava Ranch, and fossil shells found in indurated ocean silt, 300 ft. above the present bed of the Kern river, and a mortar with ball, found at the bottom of gravel deposit 10 ft. below the present surface. By Chas. H. Gilbert, H. W. Harkness and W. G. W. Huford, some excellent specimens of fish, including a stuffed sturgeon about seven ft. in length. By Miss S. Plummer, a fossil shell said to have been found on the bluff near the Cliff House. By J. H. Clark, Catho, Mendocino county, *sciuropterus volucella*, or flying squirrel.

Mr. B. B. Redding made some comments on the metate found at Hawkinsville near the Oregon line, nine ft. below the surface of the earth. It was a sort of table of stone resting on one long and two short legs, and was remarkable for being made of Mt. Shasta lava, evidently fashioned by former inhabitants of that region or by the present Indians or their ancestors. The metate is in use in Mexico, and it was supposed to have originated there; but evidently they had nothing to do with this one. He saw a smaller one at Yreka, which was found 23 ft. below the surface of the bar of the Klamath river. The fact that these evidently uncivilized people could take that hard stone and work it into shape with the rude instruments they had adapted to that purpose, was very remarkable. The metate was used for grinding grass seed, acorns and wild oats, which those people used for food. They were placed upon the table and the women crushed them with a roller, after which the meal fell into a dish or basket made of wild grass, formed with such skill that they were capable of holding water. Long lingao, another form of metate, was in use, made very much in the shape of a shell, and it looked like the back of a turtle. Mr. Redding next directed his attention to the Indian fisher, found by W. F. Walmsley, of Beowawe, Nevada, which was formed out of hornstone, a flinty substance, and which they used in dressing skins. J. W. McCoy, by letter, explained that he had found by experiment upon those susceptible to poison oak, that green or black tea boiled down to form a strong infusion, mixed with salt and applied to the part will prove effective in curing the affection. It worked where common salt seemed to be of no avail, and he suspected that its excellence was due to the tannin contained in the infusion. He believed that oak bark, or any substance containing a great quantity of tannin would be beneficial.

The Phylloxera.

The chairman read extracts of his own translation from the recent work of M. Maxime

Cornu on the phylloxera, describing the pestiferous insect from its inception to its maturity. Cornu devoted much time to the study of the phylloxera, making numerous investigations with the microscope and preparing some very elaborate plates of the insect in the different stages. He says that the phylloxera cannot be wet by any aqueous solution or water, for it has the power to inclose itself in a globe of air. Possibly water long continued might succeed in asphyxiating it. It also hides under the corky layer of the bark of the root of the vine, which is not readily attacked by moisture and succeeds in escaping from the effects of dangerous substances and washes. Pulling up the vines will not exterminate the pest, for some remain in the little rootlets, and come to the top of the ground again. In order to destroy them, it is necessary to have some treatment for the soil, capable of emitting some noxious vapor. This is the best way to attack the insect. The chairman explained that it seemed

Influence of Cages in Mine Ventilation.

A great deal depends upon the system of ventilation employed in mines. Not only will it influence the individual miners, but the whole mine and its profits as well. And especially is this the case in our very deep mines where the extensive underground workings extend in every direction laterally from the shafts for great distances. Not only is this subject one which affects the general health of mines, but their safety also. The system of upcast and downcast shafts, which is the simplest form of ventilation, is too well known to be more than referred to. In this a natural air current is induced.

The moving upward and downward in the shafts of the cages naturally influences the ventilation more or less, but not in the way one

A New Double Drum Mine Hoist.

The accompanying cut represents an improved style of hoisting engine constructed at the Pacific Iron Works in this city. Quite a number of various sizes have recently been sent to prominent mines in different parts of the coast, and are said to give great satisfaction. A more compact, convenient and complete hoist, adapted to the requirements of practical work, has probably never before been devised. The following is a description of its construction and operation:

The hoist here shown is intended for mines having a double compartment shaft, and a pair of link motion engine attached to one crank shaft. The drums are loose on their shaft, and are brought into action by clutches sliding on steel feathers set into the shaft. The spur gear is keyed fast to the drum shaft, the bearing of which rest on solid cast brackets over each engine bed stand, and a cast bracket bolted to foundation in its center. By this arrangement the drums can be used together or separately, or one can be hoisting whilst the other is lowering into the shaft. A friction band brake is attached to the fly-wheel on crank shaft, and upright friction post brakes, with wooden shoes, act upon the brake rings of drums, the various levers for which, including the reversing gear and throttle valve, are all arranged so as to be under the control of the engineer at one point. They are made of various sized cylinders, from 10 inches to 16 inches in diameter.

RICH PLACER DISCOVERIES.—The Yuma Sentinel, of October 16th, says: During the past week considerable excitement has prevailed, caused by reports concerning the rich field of gold placers some eight miles from Mesquite station, about 40 miles west of here on the S. P. railroad. Yesterday

our news from there informs us that about 50 men are on the ground, nearly all of whom went from this town. Several men have been in during the week bringing with them from \$170 to \$800 in gold, which they have disposed of here. One dry washer is at work on the ground belonging to Hoagland and Powers, with which they are dry washing about six tons of dirt per day, averaging about \$16 to the ton. There is no doubt but that very extensive placer grounds exist there, although it may not all be as rich as the present location. Some very rich quartz ledges were located in the immediate vicinity of the placers nearly a year ago, and parties who own them are making preparations to work them immediately. From present appearances a large and thriving mining camp will spring up, which will add to the business prosperity of Yuma very materially.

The Superintendent of the Hite mine, at Hite's Cave, Mariposa county, was killed on the 29th ult. He was down in the mine, and being affected by foul air signaled to be drawn up, and just as he reached the surface and was about to step off, the cage rope parted and he fell to the bottom of the shaft, being horribly mangled. The shaft down which he fell is 700 ft. deep.

DOUBLE DRUM GEARED HOIST FOR ROUND WIRE ROPE.

that viticulturists had now overcome that difficulty by using bi-sulphide of carbon, or some kindred substance.

MEADOW LAKE.—The Truckee Republican learns from James Gould, that H. H. Hartley is still pushing ahead on his mine, the Excelsior, at Meadow Lake. Hartley is just as enthusiastic as ever, and firmly believes that section will ere long be the great mining center of the Sierras. He works his rock by hand, and has thereby made a living for himself for the last 10 years. Some of the rock in the Excelsior is said to go over a thousand dollars per ton. Hartley was the discoverer of the district, and he has remained there ever since. In winter he is generally alone, his only companions being the lonely pines and about 20 or 30 ft. of snow. If perseverance and faith go for anything, Mr. Hartley will some day become a bonanza prince.

The balance sheet of the New York Hill M. Co., Grass Valley, for the fiscal month ending October 15th, shows balance of cash on hand, after the payment of a \$10,000 dividend, of \$46,085.86. The billion receipts of the month were \$27,028.05 from amalgam, and \$2,888.70 from sulphurets, or a total of \$29,916.75.

could suppose. The influence of winding in both shafts on the amount of ventilation will be evident from the following results of a series of experiments carried out at Kirkless Hall colliery, England: The same engine winds from both shafts, so that whilst the cage is ascending in the one shaft it is descending in the other. When the winding engine is at rest the amount of ventilation was given as 62,000 cubic ft. per minute. When the cage is descending in the up-cast and ascending in the downcast shafts, the ventilation is given as 37,400 cubic ft. per minute. When the cage is ascending the up-cast and descending the downcast shafts, the ventilation amounted 67,400, or the mean during winding is 52,400 cubic ft., or 9,500 less during winding operations than when the cages are at rest. The shafts are 85 square ft. area, and the velocity of winding 15 ft. per second, or 900 ft. per minute, slightly greater than the velocity of the air current in the shaft.

BECAUSE of a rise in the price of water supplied to miners in Onion valley, El Dorado, the miners have allowed it to be shut off, but they are making money out of their claims without the aid of this water. One claim pays as high as \$1,000 per month and over with a rocker. There are some six or eight paying mines in the vicinity.

The Profusion of Life.

From the Introduction to "Life and her Children," in *Popular Science Monthly* for November:

I wonder whether it ever occurs to most people to consider how brimful our world is of life, and what a different place it would be if no living thing had ever been upon it? From the time we are born till we die, there is scarcely a waking moment of our lives in which our eyes do not rest either upon some living thing or upon things which have once been alive. Even in our rooms, the wood of our furniture and our doors could never have been if life did not exist; the paper on our walls, the carpet on our floors, the clothes on our back, the cloth upon the table, are all made of materials which life has produced for us; nay, the very marble of our mantel-piece is the work of once living animals, and is composed of their broken shells. The air we breathe is full of invisible germs of life; nor need we leave the town and go to the country in search of other living beings than man. There is scarcely a street or alley where, if it be neglected for a time, some blade of grass, or struggling weed does not make its appearance, pushing its way through chinks in the pavement or the mortar in the wall; no spot from which we cannot see some insect creeping, or flying, or spinning its web, so long as the hand of man does not destroy it.

And when we go into the quiet country, leaving man and his works behind, how actively we find life employed! Covering every inch of the ground with tiny plants, rearing tall trees in the forest, filling the stagnant pools full of eager, restless beings; anywhere, everywhere, life is at work. Look at the little water heetles skimming on the surface of the shady wayside pool, watch the water snails feeding on the muddy bank, notice the newts putting their heads above water to take breath, and then remember that besides these and innumerable other water animals visible to the naked eye, the fairy shrimp and the water flea, and other minute animals, are probably darting through the water, or floating lazily near its surface, while the very scum which is blown in ridges toward one corner of the pool is made up of microscopic animals and plants.

Then, as we pass over plain, and valley, and mountain, we find things creeping innumerable, both great and small, hidden in the moss or the thick grass, rolled up in the leaves, boring into the stems and trunks of trees, eating their way underground or into even the strongest rock. The lion, the tiger, and the elephant, roaming over Asia, Africa and India, rule a world of their own where man counts for very little. Even in our own thickly peopled country hares and rabbits multiply by thousands in their burrows, and come to frolic in the dusk of evening when all is still. The field-mice, land and water rats, squirrels, weasels and badgers have their houses above and below ground, while insects are to be found everywhere, testifying to the abundance of life. Not content, moreover, with filling the water and covering the land, this same silent power peoples the atmosphere, where tiny hats, hutterflies, bees, and winged insects of all forms and shapes and colors, fight their way through the ocean of air, while birds, large and small, sail among its invisible waves.

And by and by we reach the sea, and there we find masses of tangled seaweed, the plants of the salt water, while all along the shores myriads of living creatures are left by the receding tide. In the rocky pools we find active life busily at work. Thousands of tiny acorn shells, scarcely larger than the head of a good-sized pin, cover the rocks and fling out their thread-like arms in search of food. Small crabs scramble along, or swim across the pools, sand-sippers dart through the water, feeding on the delicate green seaweed, which in its turn is covered with minute shells not visible to the naked eye, and yet each containing a living being.

Anywhere, everywhere, creatures are to be found, and even if we sail away over the deep silent ocean and seek what is in its depths, there again we find abundance of life, from the large fish and other monsters which glide noiselessly along, lords of the ocean, down to the jelly masses floating on the surface, and the hanks of rocky coral built by drops of living slime in the midst of the dashing waves. There is no spot on the surface of the earth, in the depths of the ocean, or in the lower currents of the air, which is not filled with life whenever and wherever there is room. The one great law which all living beings obey is to "increase, multiply and replenish the earth;" there has been no halting in this work from the day when first into our planet from the bosom of the great Creator was breathed the breath of life, the invisible mother ever taking shape in her children.

No matter whether there is room for more living forms or not, still they are launched into the world. The little seed, which will be stifled by other plants before it can put forth its leaves, nevertheless thrusts its tiny root into the ground and tries to send a feeble shoot upward. Thousands and millions of insects are born into the world every moment which can never live, because there is not food enough for all. If there were only one single plant in the whole world to-day and it produced 50 seeds in a year, and could multiply unchecked, its descendants would cover the whole globe in nine years.* But, since other plants prevent it from spreading, thousands and thousands of its seeds and young plants must be formed only to perish. In the same way one pair of birds having four young

ones each year, would, if all their children and descendants lived and multiplied, produce *two thousand million* in 15 years,† but, since there is not room for them, all but a very few must die.

What can be the use of this terrible overcrowding in our little world? Why does this irresistible living breath go on so madly, urging one little being after another into existence? Would it not be better if only enough were born to have plenty of room and to live comfortably?

Wait a while before you decide, and think what every creature needs to keep it alive. Plants, it is true, can live on water and air, but animals cannot; and, if there were not myriads of plants to spare in the world, there would not be enough for food. Then consider again how many animals live upon each other. If worms, snails and insects were not over-abundant, how would the birds live? Upon what would lions and tigers and wolves feed if other animals were not plentiful, while, on the other hand, if a great number of larger animals did not die and decay, what would the flesh-feeding snails and maggots and other insects find to eat? And so we see that for this reason alone there is some excuse for the over-abundance of creatures which life thrusts into the world.

But there is something deeper than this to consider. If in a large school every boy had a prize at the end of the half year, whether he had worked or not, do you think all the boys would work as hard as they do or learn as well? If every man had all he required and could live comfortably, and bring up his children to enjoy life without working for it, do you think people would take such trouble to learn trades and professions, and to improve themselves so as to be more able than others? Would they work hard day and night to make new inventions, or discover new lands, and found fresh colonies, or be in any way so useful or learn so much as they do now?

No, it is the struggle for life and the necessity for work which make people invent and plan, and improve themselves and things around them. And so it is also with plants and animals: life has to educate all her children, and she does it by giving the prize of success, of health, and strength, and enjoyment to those who can best fight the battle of existence, and do their work best in the world.

Every plant and every animal which is born upon the earth has to get its own food and earn its own livelihood, and to protect itself from the attacks of others. Would the spider toil so industriously to spin her web if food came to her without any exertion on her part? Would the caddis-worm have learned to build a tube of sand and shells to protect its soft body, or the oyster to take lime from the sea water to form a strong shell for its home, if they had no enemies to struggle against and needed no protection? Would the bird have learned to build her nest or the beaver his house if there were no need for their industry?

But as it is, since the whole world is teeming with life, and countless numbers of seeds and eggs and young beginnings of creatures are only waiting for the chance to fill any vacant nook or corner, every living thing must learn to do its best and to find the place where it is most useful, and least likely to be destroyed by others. And so it comes to pass that the whole planet is used to the best advantage, and life teaches her children to get all the good out of it that they can.

If the ocean and the rivers be full, then some must learn to live on the land, and so we have, for example, water snails and land snails, and whereas one kind can only breathe by gills in the water, the other breathes by means of lungs in the air, while between these are some, such as the river snails of the tropics, which have both gills and lungs, and can breathe in both water and air. We have large whales sailing as monarchs of the oceans, and walruses and seals fishing in its depths for their food, while all other animals of their kind live on the land.

Then, again, while many creatures love the bright light, others take advantage of the dark corners where room is left for them to live. You cannot lift a stone by the seaside hut what you will find some living thing under it, nor turn up a spadeful of earth without disturbing some little creature which is content to find its home and its food in the dark ground. Nay, many animals for whom there is no chance of life on the earth, in the water, or in the air, find a refuge in the bodies of other animals and feed on them.

But in order that all these creatures may live, each in its different way, they must have their own particular tools to work with, and weapons with which to defend themselves. Now, all the tools and weapons of an animal grow upon its body. It works and fights with its teeth, its claws, its tail, its sting, or its feelers; or it constructs cunning traps by means of material which it sucks out of the water, as in the case of the oyster, or gives out from its own body, like the spider. It hides from its enemies by having a shape or color like the rocks or the leaves, the grass or the water, in which it lives. It provides for its young ones either by getting food for them, or by putting them, even before they come out of the egg, into places where their food is ready for them as soon as they are born.

So that the whole life of an animal depends upon the way in which its body is made; and it will lead quite a different existence according to the different tools with which life provides it, and the instincts which a long education has been teaching to its ancestors for ages past. It will have its own peculiar struggles and difficulties, and its own peculiar triumphs according

to the kind of bodily powers which it possesses, and the study of these helps us to understand its manner of existence.

And now, since we live in the world with all these numerous companions, which lead, many of them, such curious lives, trying, like ourselves, to make the best of their short time here, is it not worth while to learn something about them? May we not gain some useful hints by watching their contrivances, sympathizing with their difficulties and studying their history? And, above all, shall we not have something more to love and to care for when we have made acquaintance with some of life's other children besides ourselves?

What we most want to learn is something of the *lives* of the different classes of animals, so that when we see some creature running away from us in the woods or swimming in a pond, or darting through the air, or creeping on the ground, we may have an idea what its object is in life—how it is enjoying itself, what food it is seeking, or from what enemy it is flying.

And, fortunately for us, there are an order and arrangement in this immense multitude, and in the same way as we can read and understand the history of different nations which form the great human family spread over the earth, and enter into their feelings and their struggles, though we cannot know all the people themselves; so, with a little trouble, we may learn to picture to ourselves the general life and habits of the different branches of the still greater family of life, so as to be ready, by and by, to make personal acquaintance with any particular creature if he comes in our way.

A Railway in the Rocky Mountains.

A correspondent of the *Donver Times*, describing the extension of the Denver and Rio Grande railway from Conejos westward toward the San Juan country, gives these picturesque hits. He says: For miles the railway curved among the hills, keeping sight of the plains and catching frequent glimpses of the village. Its innumerable windings along the brows of the hills seemed, in mere wantonness, as loth to abandon so beautiful a region. Almost imperceptibly the foothills changed into mountains and the valleys deepened into canyons, and winding around the point of one of the mountains it found itself overlooking the picturesque valley or canyon of Los Pinos creek. Eastward was the rounded summit of the great mountain of San Antonio; over the nearest height could be seen the top of Sierra Blanca, canopied with perpetual clouds; in front were castellated crags, art-like monuments and stupendous precipices. Having allured the railway into their awful fastnesses, the mountains seemed determined to haffle its further progress. But it was a strong hearted railway, and, although a little giddy 1,000 ft. above the stream, it cuts its way through the crags and among the monuments and hears onward for miles up the valley. A projecting point, too high for a cut and too abrupt for a curve, was overcome by a tunnel. The track layers are now busy at work laying down the steel rail at a point a few miles beyond this tunnel. The grade is nearly completed for many miles further. From the present end of the track for the next four or five miles along the grade, the scenery is unsurpassed by any railroad scenery in North America. Engineers who have traversed every mile of mountain railroad in the Union, assert that it is the finest they have seen. Perched on the dizzy mountain side, at an altitude of 9,500 ft. above the sea—greater than that of Vets pass—1,000 ft. above the valley, with hattermented crags rising 500 or 600 ft. above, the beholder is enraptured with the view. At one point the canyon narrows into an awful gorge, apparently but a few yards wide and nearly 1,000 ft. in depth, between almost perpendicular walls of granite. Here, a high point of granite has to be tunneled, and in this tunnel the rock men are at work drilling and blasting to complete the passage, which is now open to pedestrians. The frequent explosions of the blasts echo and re-echo among the mountains until they die away in the distance. Looking down the valley from the tunnel, the scene is one never to be forgotten. The lofty precipices, the distant heights, the fantastic monuments, the contrast of the rugged crags and the graceful curves of the silvery stream beneath them, the dark green pines interspersed with poplar groves, bright yellow in their autumn foliage, that crown the neighboring summits—height, depth, distance and color—combine to constitute a landscape that is destined to be painted by thousands of artists, reproduced again and again by photographers, and to adorn the walls of innumerable parlors and galleries of art. Beyond the tunnel for a mile or more the scene is even more picturesque, though of less extent. The traveler looks down into the gorge and sees the stream plunging in a succession of snow-white cascades through narrow cuts between the perpendicular rocks.

THE 3,000 LEVEL.—The first ore bodies discovered on the Comstock, says the *Carson Appeal*, were small but frequent; then came a barren belt until the Big Bonanza was found in Con. Virginia and California. Now they are sinking through another barren belt, and below this the indications are that there is ore, and when found it will prove something wonderful. Mackey never believed that the 2,600 of Union would show anything, neither did Patton. They are making for the 3,000 level and following the stringers down

An Asiatic Mint.

The mint at Cahul, Afghanistan, does a large business in recoining English into Afghan rupees. The business is very profitable, as appears from the fact that although the Afghan rupee contains 2½ less alloy than the English, the relative values are as 12 to 15. In addition to the recoinage of rupees, Chinese silver, personal ornaments and the silver coinage of other countries are also converted into coin. A correspondent of the *London Times* gives the following description of the mint and the processes carried on therein:

"In one of the rude sheds running around the court-yard, are two rows of small, round clay hearths, elevated an inch or two above the floor, and depressed, like a plate, in the middle. A pile of rupees—generally 300—having been counted and weighed, is placed upon one of these hearths in a carefully prepared bed of hone ashes, and covered over with charcoal and wood. The charcoal is then lighted, and, when well aglow, four lbs. of lead for every 300 rupees are added to the furnace. The lead, in combination with the hone ashes, separates, as is well known, the alloy. This first process converts the rupees into a dull, unsightly mass of silver, free, or nearly so, from alloy. The pure silver thus extracted is then carried to another shed, carefully weighed, and an amount of English rupees equal to its weight added to it. Rupees and silver are then melted together in a clay crucible, and the melted mixture is ladled by hand into molds, which give it the shape of flattened bars about 12 inches long. These bars are then taken to a third shed, to be annealed by hammering and given the form of slender round rods. The next process is that of drawing these rods through a plate of iron perforated with round holes to give them a uniform circumference. This is done by means of a rude hand-wheel; after which, the rods are cut by a hammer and chisel into the lengths requisite to form the future rupees, each of which lengths is carefully weighed in a pair of scales. Any that are too heavy are handed to a workman, whose business it is to slice off a fragment with his chisel; and that, on the contrary, are too light, are handed to another workman, who notches the little cylinder by a blow on his chisel, and inserts the required fragment in the notch. The cylinders are next carried to a fifth shed, and after gently heating, are hammered into small round disks, which have a yellowish-white color. To remove this color and give them brightness, they are next plunged into a caldron of boiling water, in which they are hoiled for some time, along with apricot fruit and salt. This process imparts brightness to the dull disks of silver, and they are then ready for the last process they have to go through, that of stamping. This is perhaps the most interesting part of the operation. Two operators sit facing one another, half naked, on the ground, with a little iron anvil between them. In the face of the anvil is inserted a steel stamp, destined to give the impression which the under side of the rupee will bear. One operator places the little silver disks with great quickness and accuracy upon the stamps; and the other, who is armed with a heavy hammer in right hand, and a steel stamp, hearing the inscription destined for the upper side of the rupee, in his left, with one heavy, well-delivered blow, impresses the device on the soft lump of silver. Lastly, each rupee thus stamped is again weighed, and deficiencies in weight made up by the same rude process as noted at another stage of the work, the amended rupee passing once more under the hands of the stampers."

A GREAT QUARTZ MILL.—The Butte (Montana) *Miner*, of October 21st, gives the following account of the splendid new mill of the Alice mine: The progress made during the past two weeks towards the completion of the new mill is very satisfactory. The three batteries of boilers, with their attachments, have been successfully put up. The 450-horse power engine, the largest in the Territory, is in position, and lacks only the fly-wheel, not yet arrived, to be complete. Twelve of the 18 pans and 6 of the nine settlers are ready to begin work. The mortars for 60 stamps and battery timbers for the same are in place, and the stamps are in the mill ready for adjustment. The re-torts and a portion of the winter's salt supply have also been received. On the ore floor 400 tons of ore have been dumped, to be in readiness for the stamps when the fires are started. The Statefeldt auxiliary furnaces on the west side of the mill will be finished this week, and those on the east side are being forwarded as fast as possible. Outside the mill is a reserve of upwards of 4,000 tons of ore, to be used in case of accident to the machinery at the mine. The inside of the building is already beginning to look like a quartz mill. It will be complete in all its appointments, and will be the largest structure of the kind in the world. It is a veritable forest of timber.

It is a curious fact that every prince of the royal house of Prussia, when young, is taught some useful trade or other, for the purpose of sobering the mind and bringing it face to face with the material world and the realities of life, and among the profusion of curiosities and artistic relics which crowd the Emperor's private cabinet may be seen specimens of bookbinding, carving, carpentering, and other handiwork performed by his sons and grandsons.

A 40-STAMP mill was recently shipped from this city to the Mina Prieta of Sonora.

*Huxley.

MECHANICAL PROGRESS.

The "Anthracite."

The little steam yacht *Anthracite*, which has lately visited this continent from England, being the smallest steamer that has ever performed the voyage under steam, crossed the Atlantic in 18 days, on a consumption of 19 tons of coal. This event naturally created a great deal of interest with the public generally, as well as with scientific engineers. While she was in this country, she was examined and inspected by many of our leading engineers and ship owners, etc., who took advantage of the various opportunities given them of observing the working of the machinery during many short trips made for their convenience while the yacht was lying off New York, Philadelphia, Providence, Newport and Stonington.

Just previous to her departure, at the request of the United States Naval authorities, she was, for about a fortnight, in the hands of the engineers of the Navy yard at Brooklyn, where a board of officers, under Chief Engineer C. H. Loring, U. S. N., and appointed by Mr. Shock, Chief of the Engineering Bureau at Washington, opened up and examined her machinery, and were very much pleased with the appearance of the cylinders and rings after the Atlantic voyage. They also carried out a series of tests and experiments as to the capabilities of the boiler and engines, the consumption of water and coal, etc., taking during the trials about 300 diagrams and other data. To work up all these data and prepare a report will of course take time, and the report has not yet been made.

Her safe and successful return to England has already been reported. Immediately after her return, her machinery was carefully examined by a competent board of engineers, who reported that her engines and boiler were not one whit the worse for her run of 10,000 miles with steam at pressures varying from 300 to 400 lbs. per square inch all the time. No repairs of any kind have been made to either engines or boiler since she left England in May last, beyond the making good a circulating pump valve which got adrift after leaving Falmouth for London on her way back.

It will be remembered that the *Anthracite* is engined on the Perkins' high-pressure principle, and was commissioned for the special purpose of testing the practicability and economy of applying high-pressure engines to ocean navigation. The boilers used are of tubular construction, and are considered safe at 800-lb. pressure. Heretofore the boilers of sea-going steamers have been considered unsafe at even 70 lbs. The question of economy in generating and applying steam in ocean steamers, is one of vast interest to the entire community, and the parties who fitted out the *Anthracite* are deserving of much credit for this interest they have taken in the matter. The trial has been one of the most important and interesting ever undertaken in any country since the general inauguration of ocean steam navigation; and as the matter now stands, it looks very much as though the experiment might be the initiatory steps toward inaugurating a new era in marine engineering.

There is claimed for this system: 1st, small consumption of fuel; 2d, safety from explosion; 3d, durability of boilers; 4th, disuse of lubricants; 5th, reduction in weight and space—any one of which is an important consideration to steam users.

It may not be out of place to state here that there is an engine already in use, and being built by the Herreshoff Manufacturing Company, of Bristol, R. I., which, if we understand its construction, is designed to accomplish the same end as that proposed by the proprietors of the Perkins engine. These engines, however, are of the compound type, and the company named have issued a challenge to the English company for a competitive test, in similarly built boats, in relation as to the speed and economy of the two engines.

Hardened Steel.

The well-known fact that steel is of less specific gravity after hardening has given rise to varied explanations as to the cause, but it seems no unnatural result when viewed in connection with the general experience with other metals under heat treatment. It is indeed a matter of some surprise that so much doubt and difference of opinion should exist.

In tempering or hardening, the steel is heated to the required temperature, and then dipped into the hardening fluid, and thus undergoes a rapid cooling process.

The effect of the rapid cooling is to hastily set the outer surface of the steel with a slight contraction around the hotter and still expanded metal within, leaving the volume of the steel a trifle greater than if all the molecules had been cooled simultaneously, and allowed their own share in contraction, which would have the effect of a gradual cooling of the steel, when the metal would have returned to its original constitution prior to heating.

It is for the same reason that a steel bar, being heated and one face only dipped into the cooling or hardening fluid, will be longer on the tempered or cooled face than on the untempered face, demonstrated in the bending the bar, the hardened portion being the outer or longer surface of the bend. The tempered

face is cooled suddenly, and "set" while the bar is still of nearly a length due to the expansion of heat, and the rest of the bar cooling gradually has a tendency to shrink or contract normally, but is affected by the set condition of the tempered portion.

The bar, if of wrought iron, would not show as great a bend as if of steel, owing to the fact of wrought iron being a somewhat better conductor of heat, and to the greater freedom of action in the molecules of wrought iron than those of steel.

The result of a similar treatment of copper (gold or silver) would be much less marked than in either steel or wrought iron, with correspondingly less variation in specific gravity, the heat conducting powers and freedom of molecular action of the former metals being much greater than of iron and steel. Glass or porcelain being very poor conductors of heat, and the molecules having little freedom of action, snap asunder under the same treatment.

To recapitulate: The specific gravity, under the circumstances mentioned above, would vary inversely as the power of heat conduction and freedom of molecular action of the various metals or substances experimented upon.—*American Engineer.*

Economic Production of Steam.

The *American Manufacturer* states that for 35 years persistent efforts have been made to run steam generators inside the fire-box or furnace of steam boilers. All, however, proved signal failures until Mr. Good hit upon the true principle of keeping up a steady and continuous supply of water from the boiler into the generator. No matter how intense the heat to which the latter is subjected, the water cannot be driven from it into the boiler, which is rapidly generated and forced into the boiler. In the days of prosperous manufacturing, few men paid much attention to their fuel bills, but the close margins to which all are now subjected through competition, makes the consumption of fuel a matter of serious consideration. It has been practically demonstrated that this appliance—placed in the furnace and connected with the boiler—will save from 30% to 40% in fuel. The time consumed every day in getting up steam will also be reduced about one-half. And what is equally important with the saving of fuel is that the working capacity of the boiler will be increased nearly one-half in power by the additional area of heating surface exposed to the flames in a position where the heat will be most effective, and by the rapidity with which the steam is generated. Hundreds of boilers, now unable to do the work required of them, may be retained by their owners if this device is used. There can be no question as to durability, for experience has shown that the circulation of water being maintained through the pipes they will not burn out any more readily than the flues of a boiler. It can be as easily attached to marine or locomotive as to tubular boilers. The low cost for which this apparatus can be furnished will, it is claimed, make its use universal, as it soon pays for itself.

EARLY IRON MAKING IN ENGLAND.—In the reign of Edward III. iron was so scarce that the pots, spits and frying pans of the royal kitchen were classed among the king's jewels. Up to the end of the 15th century, English iron was not only dearer but inferior to that manufactured on the continent. During the 15th century the manufacture of iron began to be extensive in Sussex, where the ore and timber for smelting it abounded, and iron mills soon became numerous in the country. The landed proprietors entered into the business eagerly, and not only were many ancient houses enriched thereby, but several new men acquired wealth and founded families. In the forest of Dean also iron was largely smelted, but the land soon became denuded of trees in consequence of the exclusive use of charcoal for smelting; people became alarmed, and many edicts were promulgated restricting the manufacture of iron. Eventually the feeling became so strong, that from the time of the Restoration the iron manufacture of England rapidly declined. Coal, as then used, injuriously affected the quality of the iron, and it was not till the beginning of the 18th century that steps were taken to overcome this difficulty.

NEW TREATMENT FOR ZINC.—It is now found practicable to relieve zinc plates or sheets of their rigidity, and thus facilitate the working of the same into the various forms desired. In the treatment of sheet zinc, with this in view, a bath of linseed oil is prepared, and into this the plates are plunged, these being subjected to the action of oil while in a state of ebullition for some 30 minutes, more or less, according to the thickness of the metal; the plates are then removed from the bath, and after the oil is thoroughly drained from their surfaces, they are well cleaned, and are then ready for the market. Plates which have passed through this process are represented to possess great ductility, and to be capable of receiving and retaining a high polish; on this account they may be advantageously employed as a substitute for lead or pewter, at a great reduction in cost in a variety of cases—among these, for example, being the linings of sinks and cisterns, and the covering of counter and other surfaces requiring a metallic protection.

SCIENTIFIC PROGRESS.

Practical Value of Science.

Our obligations to the branch of physics are almost unlimited, but we will mention only two or three applications of a single agent in this wide field. It would seem to roll back the world into the dark ages to take from it now the benefits of electricity in its multiplied and yet rapidly multiplying applications.

It seems incredible, from our present standpoint, that so short time ago, in our congressional halls, the electric telegraph was almost ridiculed and voted into oblivion, from which it could never rise. When a bill was presented, appropriating \$30,000 to be expended, under the direction of the Postmaster-General, in a series of experiments to test the merits of Morse's electro-magnetic telegraph, one member moved an amendment requiring half the appropriation to be used for the encouragement of mesmerism. Another proposed to include Millerism in the benefits of the appropriation; others to appropriate part of the sum to a telegraph to the moon. And when the bill came to a final vote, this was so close that a change of three votes would doubtless have left us till this day without the benefits of the telegraph. After his invention was in working order, and transmitting messages between Baltimore and Washington, Mr. Morse offered it to Congress, to be attached to the Postoffice Department, for the sum of \$100,000. But it was declined, on the statement of the Postmaster-General, who reported that, while the invention was "an agent vastly superior to any other ever devised by the genius of man," he was not satisfied that "under any rate of postage that could be adopted its revenue could be made to equal its expenditures." By this short-sighted want of appreciation of science, the United States Government deprived itself of a source of revenue sufficient, doubtless, to liquidate the entire national debt in a single decade.

The application of electricity, now attracting world-wide attention, enjoys a vastly more hearty reception than did the telegraph. The telephone is constructed on the principle of the human ear. It consists of an elastic diaphragm to receive vibrations of air from the human voice or from other sources, so connected with the wires of a battery (or even with wires without a battery) as to communicate the same vibrations in every respect to another membrane or diaphragm situated at a distance. The two diaphragms of a telephone in distant places correspond, in every practical sense, to the two membranes of the human ear, and the connecting wire to the chain of bones between the two membranes. Probably no invention has come more rapidly into popular favor. Already many thousands of them are in practical use in this country and abroad.

The speaking phonograph is also copied from the human ear. The vibrating diaphragm, in this case, has a stylus connected with it, which impresses the peculiarities of vibration, due to any particular sound, upon a roll of tin foil arranged to receive the impression. By reversing the process, the indentations and prominences of the tin foil cause the stylus to fall and rise, which results in vibrations of the membrane, and these reproduce the original sound. These impressed sheets of tin foil may be preserved or mailed to any part of the world, and by putting them into a similar instrument, may be made to reproduce the pitch, tone and quality of the original sound thousands of miles, or of years distant. By this instrument, voice may be photographed, as the face is photographed, and we may listen to the veritable voice of the dead, or preserve for future comparison the voice of a person from the first infant prattle and the manly utterances of mature life even to the feeble speech of old age. Public speeches and songs may thus be preserved and delivered indefinitely or till the tin foil wears out. In public libraries may be preserved languages of different nationalities spoken from century to century "with all the peculiarities of pronunciation, dialect and brogue."—*Prof. Trowbridge in The Advance.*

Change of Climate in the Sierras—The Cause.

Prof. Legate has just returned from a trip into the Sierras of eight days' duration. He had with him two assistants and his own vehicle for the transportation of his instruments, and camped out most of the time. The object of the professor's trip was the study of recent interesting meteorological changes in the elevated regions of the Sierras. He was led to believe that during the present season the warm belt had shifted south. Beginning at a point just north of Lake Tahoe, the snow has not melted away as in former years. There are now banks of snow from 50 to 100 ft. in depth at points where heretofore at this season no snow has lain. Nearly the whole of this snow will remain where it now lies until the snows of winter again set in. Up toward the head waters of the North Fork of the Yuba river, where no snow is usually seen at this season, it has but little more than begun to disappear. In that place are to be seen huge banks of snow, under which flow the waters of the stream, forming arches or natural bridges 100 ft. in height, and from 200 to 300 ft. in width.

It was for the purpose of ascertaining the cause of this remarkable change of climate that Prof. Legate went on his expedition into the mountains. Through the results obtained by observations made at many points with various delicate instruments, but principally by means of careful thermometrical tests, this professor has established the fact that there has occurred in the range of the Sierra Nevada mountains this season a grand isothermal change. He finds that the warm current of air which ever since the settlement of California by Americans—and probably ages before—has moved upward from the Pacific seaboard to the Sierra Nevada mountains and thence turned and flowed to the northward along the west side of the main ridge of the range, thus giving to all regions in that direction a warm climate, no longer moves in that direction. It now comes up from the side of the ocean and pours eastward directly across the crest of the Sierras near Lake Tahoe.

Prof. Legate has satisfied himself that this wonderful change, which is leaving all the northern parts of the Sierras buried in snow, summer and winter, is caused by the denudation of timber which the mountains have suffered through a belt beginning at Lake Tahoe and extending some 20 miles southward. Through the great gap thus left by the sweeping away of the forests now flows the warm current of air which formerly moved—with something of the circling motion of water in an eddy—far along the mountains to the northward. Prof. Legate says it must not be supposed that the change has been caused merely on account of the gap or trough left by the clearing away of the forests. The denudation of the ground is the principal cause. The heat of the sun pouring down upon the broad belt of bare ground now reaching across the mountains causes at that point an immense ascending column of heated air which draws in from the west the current which formerly moved to the northward and now all crosses the Sierras, passing in an upward and eastward direction.

The professor is of the opinion that the only thing capable of changing the isothermal line which has been recently accidentally and disastrously established is the creation, at some point well north, of another broad belt of denudation, the influence of which will be to draw in that direction a portion of the warm current of air moving up to and along the western slope of the Sierras, and thus partly restore the equable temperature that formerly prevailed. He thinks the railroad which is to run in the direction of Oregon from Reno, and which is to strike and tap the great pine forests of the Sierras well to the north, will after a few years effect the desired change.—*Virginia City (Nev.) Enterprise.*

PHOSPHORUS IN IRON.—Of all the hindrances in the way of producing good iron, phosphorus is the most vicious ingredient to be removed, and the quantity present in most ores is much more than is generally supposed. Mr. Bell, in a recent statement, said that fully 30,000 tons of phosphorus were contained in the ores annually taken from the mines of Cleveland, in the north of England. The process of separation has not yet been fully mastered, notwithstanding great progress has been made in that direction during the last 10 years. Many minds are now engaged in this research. "It may be difficult," as remarked by Mr. Bell, "but let it not be supposed that there would be any surprise excited in the minds of chemists if a simple and inexpensive process for separating iron and phosphorus were made known tomorrow; so that only one of the latter should be found in 5,000 of the former."

ELECTRIC LIGHT IMPROVEMENT.—One of the great drawbacks to the economical use of the electric light is the waste of light attending the use of ground glass, no proper substitute for which has been suggested until now. A Frenchman, M. Clemandot, has been trying recently to use fine spun glass or "glass wool" for diffusing the light of the electric arc, his object being to decrease the waste usually attending the employment of ground glass. He builds up his globe, which is conical in shape, with a number of tubes placed side by side and well closed at the top and bottom to exclude the dust. These tubes are filled with glass spun by a peculiar process, so as to yield fibers very much finer than the finest cocoon silk. It is stated that he succeeded in reducing the absorption of light from 30% with ordinary globes to 15% by the use of his improved apparatus.

A PHENOMENON OF ELASTICITY.—If elastic gum is warmed, then expanded and wound in a spiral upon a glass tube or wire and cooled for a short time in a cooling mixture, it shows no tendency to contract, but when it is submitted to hot water it returns quickly to its original length. This phenomenon can also be noticed without the use of the cooling mixture. If one holds heated gum a second in an expanded condition it shows no disposition to return to its original length; but if one immerses it in hot water it contracts to one-fourth or one-fifth and remains contracted to the third or fourth of its original length. Maxwell found similar phenomena in gutta-percha, when this was subjected to expanding influences when in a cool condition. These are very marked phenomena of the secondary effects of elasticity.

PINES and other needle-leaved trees, and especially those containing resinous matter, absorb and exhale more water than other species.

The Osmanli, of Constantinople, says: "Let those who accuse us of perfidious procrastination come and see, as we see, the misery of our position; come and feel, as we feel, the tortures of our agony. We are not afraid; we are starving. Usury is devouring us. Poverty is seated under the shadow of the palace. It is only by ruinous loans that a pittance can be doled out to the humblest officials. An unfortunate clerk cannot obtain a couple of liras without an imperial order."

THE SEBASTOPOL MINE.—The Sebastopol mine, in Grass Valley district, continues to present well, and the work of its development is attended with very satisfactory results. A crushing will be made shortly.

CENTENNIAL MINE.—A private letter received here states that work on the Centennial mine, in Washington township, which has been suspended during the past summer and fall, will be resumed soon.

PLACER.

YUBA DITCHER.—Dutch *Fall Forum*, Oct. 30: We understand the work of replating the South Yuba Co.'s ditches is being rapidly pushed ahead and in a short time the whole line of ditches owned by that company will be put to thorough repair, when the water will be turned into them. The Polar Star and Southern Cross mines will be started up as soon as the water is turned into the ditches.

EXPLOSION.—Placer *Argus*, Oct. 30: A man named Boynton had both eyes blown out and received other severe injuries by a powder explosion while at work in a mine of the Julian mine, near Newcastle, last Sunday morning. He was in the act of removing a charge which hung from the ceiling when the explosion occurred.

FATAL ACCIDENT.—James T. McLean, superintendent of the Rock Creek mine, situated about 3 miles north of Auburn, was instantly killed by the fall of an iron mortar, which was being hoisted into place at the mine on the 23d. The mortar weighed 3,700 lbs., and was about being placed on a large block of iron when McLean reached in under to brush away some dirt or gravel that was on the blocks. Just at this moment the rope that held the mortar snapped and the unfortunate man was caught as if in a trap, his head and shoulders being crushed into an unrecognizable mass.

PLUMAS.

ANOTHER BIG STRIKE.—Quincy *National*, Oct. 30: The Cherokee company, near Round Valley, struck a ledge in the new shaft, at a depth of 40 ft., which is 8 ft. in width and prospects at from \$15 to \$50 per ton. They had run 6 ft. on it at last accounts, and it was as wide there as where they cut it. The company is hauling rock from the Bellas and Kettle ledges to the Kettle mill, which will start early in the week.

QUARTZ.—A new correspondent, signing himself "Star," gives us a few mining items, as follows: He dates his letter from the North Star mine. Times are waking up; quartz is rising. Your correspondent has been prospecting for a ledge about 2 miles north of Eureka for the last 3 years, and has finally succeeded in finding a well-defined quartz vein, extending a tunnel 250 ft., which is 12 ft. in width, and is 12 ft. in thickness, and prospects big is free gold. We have no way of working it, except by a strata process, and that is very slow. John Swan has located a placer claim on Squirrel creek, which many think is a splendid mine. Mobawak is beginning to look up as a quartz district. Mr. Newman will soon have a mill at work on his mine, put up by a Nevada company.

ORAVEL.—Greenview *Bulletin*, Oct. 28: In the Monte Christo mine, at Spanish Peak, exceedingly rich gravel is reported as having recently been found, far in advance of anything heretofore seen in the country.

THE BADGER HILL MINE.—Plumas valley ditch company has been bonded to Eastern capitalists for over \$200,000. It is their intention to literally corral all the water in that vicinity into huge reservoirs, and thus work extensive claims near there and in Butte valley.

BUSINESS.—The Plumas National mining company, with its new concentrators have been successfully working since the 16th inst., and their new building is in readiness for the furnace, which is now on the way from Chico. The assay building is also almost completed, and everything is being pushed forward as rapidly as possible.

MR. M. B. BRANSFORD, Superintendent of the Atlantic & Pacific, near the Cherokee, has let a contract to George O'Connell to build a 20-stamp mill at the mine to be run by steam. The machinery will be made by the Greenville Iron Works. Mr. Bransford has added his force of miners and will open out a new tunnel. There is a well-defined ledge in sight and this prospect good. We learn that a wood contract will soon be let; the company has advanced money to make the first payment on the mill, and more is ready.

INDIAN VALLEY.—Mr. Wm. Skinner, foreman of the Indian Valley mine, has a force of men at work in the old Union tunnel, to strike the Indian Valley shaft. They are in 1,900 ft. at present, and at this date they have 134 ft. more to run to strike the shaft. The rock is soft at present, and if it continues so, they will reach the shaft in 4 weeks. Mr. Skinner has a force of men also at work cleaning out the old Indian Valley tunnels. Mr. Skinner is a thorough miner, and will make things boom. Mr. W. F. Arnold, the Superintendent, has a large force of carpenters at work on the old Union mill, repairing the inside. They have the boiler from the Indian Valley mill, and will run the engine with 2 boilers, which will run the 24 stamps and the rock breaker. The mill will be fed by self-feeders. The cars will run directly from the mine to the mill. The mill will be ready to run Dec. 1st.

THE SATEVCO MINING COMPANY, near Prattville, is having long timbers sawed at Lawrence's mill which are 25 inches square.

RUSH CREEK MINES.—Quincy *National*, Oct. 28: At the head of the creek we find H. Hoffman & Co. running their 9-stamp quartz mill from \$10 to \$14 rock, from their ledge which was opened 3 years ago. They are now having a new smaller string which assays \$175 per ton. They have struck another ledge about 1 mile below the mill, which is 7 ft. wide and shows finely. Further down the creek Roadie & Fritsch are taking out some fine specimens from their gravel mine. Martin & Huffman are running a tunnel for a gravel channel, near the old Bull Frog mine, with good prospects ahead. Mining has been going on at Rush Creek since 1851, and it once was a very lively mining camp. The present prospects indicate that it will be lively again. A number of Obinamen are at work in the old creek and getting good pay.

SIERRA.

RUBY.—Mountain *Messenger*, Oct. 30: Six carpenters are now busy at the Ruby gravel mine, 3 miles northwest of the Ruby City, in addition to 20 laborers engaged in grading and other work. A road has been put in from the old Piochone down Rock creek. A boarding house and powder warehouse—containing 10 tons—have been recently constructed. New machinery for running a Burelligh drill, and a good second-hand compressor, have arrived at the mine. Contractors, James Bradbury and James O'Connell, are now working on 500 cords of wood. Twenty-five tons of working material and winter provisions are en route from the lower markets. The Ruby has one of the best tunnels in the State, now in air-line 230 ft. through a formation of hard quartzite. Under the able direction of Supt. H. W. Wallis, and his foreman, A. Ravannah, work will be vigorously prosecuted for the best interests of all parties interested.

THE BUTTE COMPANY at the Gold Bluff mine will be ready to commence crushing next week. They have no difficulty in keeping the water out by "Chinese cheap labor" with a hand pump. The workmen are sinking on the ledge at a point where over \$3,000 was taken out in a few weeks when the last work was done on the ledge.

PROSPECTING above Sierra City is in steady progress, and more and more is confidently expected that several good paying gravel mines will be added to the list in that portion of the county. Quartz interests also are looking up some in that direction.

GOOD HEADWAY.—The Savage gravel company is now making 40 ft. of tunnel a week with their Ingersoll Burelligh drill, through slate and granite.

THE WILLOW CON. MINE.—Work will be commenced on the Willow Con. mine, with 2 shifts of men, in a few days. The company intend to push this winter.

TRINITY.

QUARTZ SALE.—Trinity *Journal*, Oct. 30: We learn that Waver Sebastian, of Deadwood, has disposed of his quartz claim in that district to San Francisco capitalists. This has been one of the best ledges ever discovered in Trinity, and with machinery and extensive working will doubtless prove as good as can be found any where.

NEW RIVER.—Since water gave out, little of interest to anyone has transpired here. Very little mining has been done on this river for 2 months past, with this exception at a few places where the Chinese have wing-dammed the river, and those have met with more or less success. The shrewd of the miners are now getting ready for the coming season, such as cleaning ditches, repairing flumes, etc., while others, as usual, wait to do all such work until the rains set in, and thus lose the best of the season's work. These last, of course, next spring will have but little to show for their winter's work and will throw the blame upon "a poor winter for mining; no gold in the ditches," etc. If it is comparatively dull above, such is not the case a few miles below here; I mean at the New River hydraulic mining company's work. The company has at present some 70 or 80 white men and about the same number of Chinese at work for them. The most pressing work, of course, is the erection of a dam across the river, and things are pushed with the greatest possible activity on it, no less than 60 men being at work at this. Others are busy on erecting a steam saw-mill to cut the lumber necessary for the flume, while others are grading, bining, logging, etc. It is said that this winter has been a very successful one for the company, and seems hardly possible, but Mr. J. Lufkin, the contractor, seems to know what he is about, and is confident of success. The boiler, steam-rim and smoke-stack of the mill are ready to be put in position, and the engine is expected to be in soon from the city. The boiler is a big tubular one about 14x4 ft. and of course had to be put together here, the iron having come from the city ready cut and punched. The mill, it is said, will cut 20,000 ft. of lumber per day. The camp itself reminds one of the days of early mining, and looks like a large village. There are at present 2 hotels, 3 saloons and 1 store, and other buildings are being put up at a rate of about 2 every week, while mule trains come in with supplies and material from 3 to 4 times a week. The contractor pays the men from \$2.75 to \$3 per day without board, the latter costing \$6 per week.

TUOLUMNE.

IMPORTANT STRIKE.—Tuolumne *Independent*, Oct. 30: Last Tuesday a very important strike of rich rock was made in the south shaft of the Evans mine, at 42 ft. in depth, where a rich feeder entered the shaft from the footwall side. In about 10 ft. more in depth it is expected the vein, sunk on the feeder, will make together when, if it continues as rich as at present, the low chute which this shaft exposes may outrun any former development on this valuable property. Supt. Silver has shown us the prospect from this new chute (which is about 300 ft. from the present rich ore body) taken from a small quantity of decomposed quartz, which is considered, in mining parlance, a big thing. The gold is coarse and bright.

NEVADA.

WASHOE DISTRICT.

The following statements were made on Nov. 2d in regard to the leading mines:

BECKER.—On the 2760 level the east crosscut from opposite the station is in 157 ft. The face shows quartz and porphyry. On the 3000 level the south drift is in 453 ft. from the incline station. The face is in fine-looking quartz and some porphyry. Some necessary repairs have been done on the boilers. A substantial floor has been put in the engine-room at the pump shaft.

ORVINO.—Our mine has been generally timbered 22 ft.; total depth below 1000 level, 238 ft. The material we are now sinking in is hard, gray porphyry. We have completed the station for the engine at the bottom of the upraise and put the engine in place.

CON. IMPERIAL.—The north drift, 2135 level, is in 75 ft. It will require the remainder of this week to complete the timbering of the shaft.

CATERPILLAR.—Our mine has been run an average of 14 hours per day, consuming 5 cords of wood per day. On the Forman shaft we have made good progress in cutting stations at the Suro tunnel level and for the 1500 pump and balance box.

BELMONT DISTRICT.

THE BARCELONA MINE.—Belmont *Courier*, Oct. 27: The Barcelona mine is undoubtedly one of the most promising mines in eastern Nevada, the ore being of a high grade, and as the work progresses the ore bodies look more and more encouraging. Reduction works are badly needed near the mouth of the tunnel. Enough ore can be easily extracted to keep a 20-stamp mill pounding away for years. Some of the ore is of a high grade, and the mineral belt well worthy the attention of capitalists, and they may rest assured that they will never regret the expenditure of any money they may put up for their development.

BRISTOL DISTRICT.

AN OPINION.—Pioche *Record*, Oct. 27: Mr. John A. Church, the expert sent here to examine the Hillside property by the Easterners, was agreeably disappointed upon his arrival in Bristol. He went there expecting to see old and dilapidated works, but upon discovering that everything was new, with the latest improvements, he did not feel like to express his opinion. The Hay State, in Bristol district, recently purchased by the Hillside company, spoke highly of and estimated 1,200 tons of ore in sight. He was so well satisfied with the management of the affairs of the company at Bristol, and the high things that he saw, that he decided not to go down to San Francisco to examine the books there, as was his intention.

BRISTOL CO.—The Bristol company is experiencing considerable trouble by the continual breaking of the pump shaft at the wall. The Mayflower mine is improving work progress, and there is no telling how valuable that property may eventually prove.

CENTRAL DISTRICT.

RICH ORE.—Silver *State*, Oct. 27: S. W. Hammond had a lot of 376 lbs. of ore from the Hammond mine, in Central district, worked at the Humboldt reduction works. It yielded 163 lbs. of bullion of the assay value of \$244.50, or at the rate of \$1,203 per ton. That is good enough ore for anybody.

CHERRY CREEK DISTRICT.

STARTED UP.—Ward *Reflex*, Oct. 23: The Exchange mill and mine, at Cherry Creek, we are informed by Geo. W. Parker, has been started up with a force of 25 men. The first bar of hullion was shipped on the 21st.

DUN GLEN DISTRICT.

ENCOURAGING.—Silver *State*, Oct. 27: Very encouraging reports from the Dun Glen mine are received. The Lang Syne continues to yield the usual supply of ore, and the 10-stamp mill is running steadily. An officer of the company from New York visited the mine a few days ago, and is said to have been well pleased with the prospects. The outside mine, on which work is being carried on, are looking well, and the general outlook is as good as could reasonably be expected.

EUREKA DISTRICT.

A REPORT.—Sentinel, Oct. 23: It was reported on the street last night that the workmen in the Eureka tunnel had run upon a body of ore, 14 ft. across the face of the drift. Inquiries at headquarters were of no avail, and the reporter went away none the wiser.

HOLISTO.—From a gentleman who took run over Parkersburg mine, it is confidently expected that ore-hoisting is going on slowly at the Williams, the Silver Connor, Williams & McNaughton and several other mines, but work will not be pushed until after election.

I X L DISTRICT.

MILL.—Reno *Journal*, Oct. 27: J. W. Richards, of Churchill county, informs us that negotiations are pending between capitalists and the owners of one of the leading mines of I X L district for the erection of a mill. If an agreement is effected, Mr. Richards thinks I X L will be heard from soon.

KINGS RIVER DISTRICT.

LOOKING WELL.—Silver *State*, Oct. 25: Richard Merritt, who has been prospecting the Good Hope mine, on Kings River, informs us that the ledge is looking splendidly

diddly and carries considerable gold and silver-bearing ore. A shaft has been sunk on the lead to the depth of 65 ft., and the ledge is about 5 ft. wide at the bottom of the shaft.

PROSPECT MOUNTAIN DISTRICT.

SPRING VALLEY.—Eureka *Sentinel*, Oct. 30: Mr. E. H. Rose has been over, with some workmen, on the west edge of Prospect Mountain district, opening up and developing the Woodchopper and Five-Twenty mines. He returns this morning with supplies, and says he is much encouraged with the present outlook of the above-named properties.

SECRET CANYON DISTRICT.

NOTES.—Eureka *Sentinel*, Oct. 29: Capt. Foley told us about Judge Dougherty driving a tunnel through a belt of argillaceous slate to strike at depth the great ore body that extends from the Geddes & Bertrand mine through Austin hill. If the tunnel is continued, other bodies of ore will be struck upon the contact, for it is a fact that where the contact is found in Prospect mountain and its spurs, ore bodies are found. Another tunnel, the Imperial & Hart, is being driven by Joel Dodge to tap a body of rich ore that lies in Austin hill, immediately ahead of the tunnel. The Berryman Bros. are contemplating driving another tunnel through some of the spurs of Prospect mountain on the west side. On the east side of the canyon, Pat Devlin will soon run a tunnel for the ore channel known to exist all the way from Ruby Hill to the Page & Corwin. In the Foley & Hansen tunnel, which is in some 100 ft., we noticed a small seam of ore which is very rich. It is a good, roomy tunnel, being about 01x4 ft.; is being driven through the great slate belt to strike the Commodore, Foretop and Foley mines, and the running upon such a prospect is not to be "snatched at" in so short distance. Doc Hamilton and E. R. Dennison are working on lease one of the Geddes & Bertrand series in Cave canyon. D. J. J. McLaughlin is still running a gang of men at the Irish Ambassador. Further away to the southwest is the Menagerie Groupe, the Lion, the Tiger and Leopard, owned by Pope & Co. They will finish up assessment work after the 1st of next month. Back of them is the famous Page & Corwin, the Marston and Guilford's White mine. They are all good properties, and will be worked this winter. Parties are now working the Monroe on lease, and the Scorpio mine is being worked by Messrs. Lamoureux & Potter.

WARD DISTRICT.

CROSSCUTTING.—Ward *Reflex*, Oct. 29: Crosscutting was commenced in the Martin White main tunnel last week at a point 2,000 ft. from the mouth, on the south side of the tunnel. This crosscut is headed for the old Clay chamber, where a large body of ore was found in the upper workings.

ARIZONA.

SILVER DISTRICT.—Territorial *Explorer*, Oct. 29: The Silent mine is increasing its force to 100 men as rapidly as possible, to keep the 3 1/2-mile teams, with trail wagons, busy on their 20-ton contract. A 500-ft. vertical shaft, 7x16 will be commenced at an early day on the Mesa and pushed as fast as money and muscle can drive it, and when the ledge is tapped stoppage will be started. The bottom of the present shaft shows the richest body of ore yet struck. A force of men, under the superintendency of Mr. Williams, of San Francisco, is rushing the furnaces at the river, but it will yet some time ere the "frying" commences. There are now 9 wagons rolling in the camp, and they appear to have all they can attend to. The teams owned by the Silent and Iron Cap Co.'s go to Yuma this week to haul in a lower for the furnace. It comes from the "Iron" Co. W. Wilson, of the Silent, arrived from California on the 22d.

SILVER KING.—Silver *Belt*, Oct. 27: A well-known citizen from this place, just returned from Silver King, gives us a wonderful account of the richness of the Silver King mine. The ore is accumulating so rapidly on the dumps that even the 20 stamps, as well as the concentrators and newly erected leaching works, are insufficient to keep up with the production of the mine. The ore contains so much free silver that a force of 4 men is employed in separating the pure metal (silver specimens) from the ore hoisted to the surface; boxing it ready for shipment to San Francisco. The last dividend declared only a few days ago in addition to a heavy reserve fund in the company's vaults substantiate fully all the good news we are constantly receiving from that king of silver mines in Pinal county.

OLDFIELD DISTRICT.—Silver *Belt*, Oct. 26: Winne, Thomas & Barnes have sunk a shaft on the Nantucket, 26 ft. deep, and found a body of ore 3 ft. wide which averages \$75. Charles Hayse had 140 tons of Emeline ore worked at the Baldwin mill which gave eminently satisfactory results. W. Lowther has finished a contract on the Aztec mine, of sinking 50 ft. in the shaft. That makes it 100 ft. deep. It is in ore all the way, but it is low grade. We were shown to-day some of the ore they are taking out of the Centennial mine. It is immensely rich. Excellent news reaches us from the Nugget, and from what we consider a reliable source. At 130 ft. they are taking out as rich ore as the mine has yet produced. There is 3 ft. of this rich ore, the balance of the vein carrying what would be considered a low grade. That makes it 100 ft. deep. Since the slight alterations in the Townsend mill it 5 stamps "wake the echoes" of the beautiful valley of Lost Oulch daily and nightly. This is a real little gem of a mill, and will repay any pleasure parties that are out riding to make it a visit and see how gold bullion is produced. The Olden Eagle mill is fast approaching completion, and when finished, will be the largest and best gold quartz mill in the district. The shafting and the 6 stamps are already in place.

MINERAL CREEK.—Gold *Chronicle*, Oct. 24: Mr. Sands, Dr. Lawrence and others have made some discoveries of very valuable ore that show indications of permanence. These discoveries, together with the fine ledge found by the Mineral Creek M. & Co., along the line of their main tunnel, speak well for the staying quality of ore in this camp. The fact that the company has undoubtedly a fine mine, judging from the appearance of the ledge and quality and quantity of ore now exposed. The mill is well toward completion, and the time is not far distant when bullion shipments will show the world that Mineral Creek has a bright future in store for it.

IDAHO.

IDAHO BULLION.—Silver *State*, Oct. 23: The following bullion shipments were received at Wells, Fargo & Co.'s office to-day from Idaho: Two bars, valued at \$3,501.30, from Silver City; 4 bars, valued at \$4,532.23, from Banner, and 4 bars, valued at \$4,133, from Atlanta.

BOISE COUNTY NOTES.—Yankee *Fork Herald*, Oct. 23: Operations have been going on for some time at Shaw's mountain, there being some law suits pending on them that cannot be settled till the August term of the District Court. A good deal of ore from them was worked in Plowman's mill this year and payed well. As soon as they are out of litigation work will be resumed and Boise and Ada counties will reap much benefit from them. The Gold Hill mill, at Quartzburg, commenced running on a high grade ore, and the owners are every day growing more wealthy. Work of development is still going on in the town mine, which is looking splendidly. This mine is the east extension of the Gold Hill, and at one time yielded a large quantity of exceedingly rich ore. The pay chute has again "come in" in the Sub Rosa, which is 9 miles from Idaho City, in Gambrinus district. The ore now being taken from it is a fine one. The mine is now being worked by Banner. The Wolverine shaft was down 203 ft. as usual at Banner. We were on our return. At the depth of 225 ft. a crosscut is to be run for the vein preparatory to stopping. All the mines in the district are looking well, and Banner will before long be the banner district of Boise county. The mill was to have ceased crushing Wolverine ore and started up on 100 tons from the Banner last week. The attention than heretofore is being paid to quartz. There are so many good ledges through that whole section of Idaho that it looks strange quartz has not received more attention in the past. Now that the people are looking in the right direction there is no doubt but that in the near future several more mills will be erected and general pros-

perity prevail. The anticipated good times coming, however, could be hurried if the owners of the mines would send specimens of their ore to California and Eastern companies and offer inducements to men acquainted with them to negotiate sales.

MONTANA.

STUCK UP.—Butte *Miner*, Oct. 20: It is our pleasing duty this morning to announce that they have "struck it" the Opheim. Since sinking was resumed on Thursday last, at which time the vein was about 12 inches above a depth of about 4 ft. has been added to the shaft, and the vein has widened to 4 ft. and carries ore samples of which assay as high as \$240 per ton. There is little doubt now that a large body of high-grade ore will be uncovered. Mr. Allen is certainly to be congratulated.

THE PARROT SMELTER.—Ore was yesterday broken for the Parrot smelter, southwest of the Silver Bow mill. The contract for this required amount of lumber, about 75,000 ft., has been let to Messrs. Thompson & Dodge, and the work of construction will begin immediately. The necessary machinery will be forwarded to Butte within the next few months.

FURNACE.—The matting furnace at the smelter of the Montana copper company was fired up yesterday. All the departments of the new works are in running order. The 1,500-ft. tramway leading from the mine has been completed, and ore is now regularly shipped over the track. The jiggers and vanners are doing excellent work, and the reverberatory furnaces, in which the ore goes through the desulphurizing process, are found to work to perfection. Considerable pulp has accumulated during the last week, as the matting furnace was not quite completed, but now that it has finally started up, we may expect that the fine copper matte shipments will soon be made to the refineries of the East.

LINGTON.—The stoppage west of the main working shaft continues to yield enough first-class ore to keep the Lexington stamps constantly busy. No striking is at present being prosecuted in the prospect holes west of the shaft, as enough work was done in them to prove the continuity of the vein in that direction.

MOUNTAIN BOY.—A very reassuring activity prevails in the development of this property, indicative of the faith the owners, Messrs. Wampler & Jackey, have in its permanence and value. The main incline has attained a depth of 200 ft.; a station has been cut for the 200 level and the sump is now being dug out. The vein in the bottom holds its own as to value, and has exactly doubled in width in the last 100 ft., being 15 inches wide at the first level.

MAONA CHART.—The depth of the main shaft is now 200 ft., and within the past few days crosscuts north and south have been started from the bottom to find out the precise location of the main ledge. At a depth of 65 ft. a 6-ft. vein of good ore, base in character, was passed through, but an attempt was made to follow it, as the main ledge is known to be much larger and is supposed to be of better quality.

BELL.—The Bell continues to add a heavy proportion to the ore product of the camp. The south vein, which yields only free ore, is improving almost daily, and is already in excellent shape to keep the stamps of the Clipper mill busy when the latter shall be fired up. The free ore dump contains almost 400 tons of ore. Regular shipments of ore continue to be made to the refineries of the East, and the mine may now be considered as having settled down to a solid, paying basis.

It may be positively stated that within 1 year from the present time, the stamp capacity of the Summit Valley mining district will be more than double what it is now, as there is no doubt whatever that 250 stamps will be in operation. The smelting capacity will be increased more than threefold.

NEW MEXICO.

GOLD.—News and Press, Oct. 21: Col. Bergmann brought in last week some fine-looking specimens of gold-bearing, decomposed quartz, from a new discovery above Clear creek on the Cimarron canyon. The ore has not yet been assayed, but if it goes even \$8 or \$10 a ton the mine will prove a bonanza, as the vein is clearly defined and 20 ft. wide of soft, easily-worked ore. Should this prove a valuable mine it will open up an entirely new district.

OREGON.

GALACE CREEK.—Democratic *Times*, Oct. 29: James Hansen of Galice creek, was in town this week, from whom we learn that great preparations are being made for the winter by the miners of that section. He is about putting pipe and a giant on some diggings he proposes working next season. Green Bros., of Galice creek, are taking out ore worth \$75 a ton, and have plenty of it in sight.

WALDO.—Wimer, Simmons & Co., of Waldo, were unable to clean up entirely, but they nevertheless took out nearly \$10,000 on their last run. Their previous clean-ups were also first-class. They no doubt have one of the best pieces of mining property on the coast, and expect to prove it before long.

UTAH.

BINGHAM.—Cor. Salt Lake *Tribune*, Oct. 23: The most noted experts have pronounced the mammoth gold belt of Bingham the most extensive ever yet discovered, taking in a scope of country 3 miles wide by 10 miles in length. Among the most prominent and valuable mines yet discovered on this belt are the Jordan, Stewart No. 1 and 2, Essex, Mineral Point, Overland, Highland Boy and Harriet, all of which show vast bodies of gold ore. Small capital and more enterprise is all that is required to develop this vast source of wealth. The Bonham, adjoining the Stewart No. 1, that two years ago was the Fort Sumner of Bingham, having a small army of men stationed there to protect it, we learn from good authority, is about to start up. The ore is to be milled in the Stewart No. 2 mill. The mine has immense bodies of ore in sight, some assaying up in the hundreds and averages about \$27 per ton.

FRISCO.—Times, Oct. 27: The new concentrating works at the Carbonate were started this week and work like a charm. The Horn Silver mine is not worked on Sunday now. The Horn Silver & Yolum will commence shipping iron from the Wah Wai the first of the week, and will employ all the teams they can get for the purpose. The Nahob mine, of which we have had occasion to speak 2 weeks since, shows up remarkably well. At a depth of 50 ft. the ore vein is 1 1/2 ft. thick, and indicates greater thickness as work progresses. The ore that is being taken out is exceedingly rich and the owners feel sure that they have struck a bonanza at last.

PINE GROVE DISTRICT.—From parties returned from Pine Grove a day or two ago, we learn that the numerous prospects in that district are looking remarkably well. The Carrie Lucille is opening out in grand proportions. Pine Grove holds fair to become one of the richest camps in Southern Utah, and that too in good authority.

SOUTH STAR DISTRICT.—A rich strike has been made by W. S. Martin, in South Star district, near the Creedmoor mine, between it and the Buckhorn. Two ore veins have been unearthed, one of carbonate ore 2 ft. thick, and another in close proximity 1 ft. thick, of solid galena and carbonate ore. The latter ore is very rich, and assay of it showed 70 ozs. silver and 70% lead to the ton. The best test that has been made in Star district for some time. We shall await further developments with interest.

SILVER REEF NEWS.—Miner, Oct. 30: One of the highest strikes, and by far one of the most important, that has yet been made in the camp, was made at the Buckhorn mine yesterday. A bonanza—the repeat working of the mine—which is simply immense, and the extent of which is yet unknown. The ore assays up in the hundreds, and is some of the prettiest rock we have ever seen in this district. It is needless to say that the Stormont folks are smiling clear to the back of their ears. The bullion shipments from Silver Reef through Wells, Fargo & Co. from the 14th to the 26th inclusive, aggregate the sum of \$19,867.12. Total for the month, to date, \$70,354.04.

The Remedy for the Phylloxera—No. 1.

EDITORS PRESS:—It is not here necessary to detail the enormous amount of destruction accomplished in our vineyards by this insignificant aphidian, the phylloxera. California has begun to groan under its effects. It has been found in most parts of the State, and many vineyards show by the yellow leaves, the drooping appearance of the vines, the greatly diminished crop of grapes and other accompaniments of the evil that this much dreaded "bug" is to figure largely in our grape interests in the future. Nor do I deem it necessary to enter into an entomological discourse on the phylloxera. Those whom this article may concern have already become sufficiently informed of its nature, habits and destructive propensities to appreciate the necessity of an immediate remedy for the evil. It is to this, therefore, that I propose to address myself exclusively.

The conditions favorable to the support of the phylloxera are found throughout the State. The insects thrive alike in rich and poor soil, on the red hill sides as well as in the rich, heavy loam of the bottom lands. Their influence may not be so well marked on strong luxuriant vines as on those of the poorer soil; but the conditions to support them are, nevertheless, there, and there are they found. Wherever the *Vitis vinifera*, or what is vulgarly termed the foreign varieties, exist, there may we look expecting to find, and if not finding, arrive at the unhappy conclusion that time is the only element necessary to produce them. France is at this day literally inhabited by them and has been subject to their depredations for many years past; but not until recently have they proved themselves so formidable as they now appear. Germany, Spain, Austria, Italy and other countries of less importance to the wine industry are badly infested; but France has suffered most. Her many hundred acres which have been rendered desolate are the world's principal monument to their destructive march. We are becoming injured now and are following in the wake of France. Therefore, let us see what France has done to prevent and remove, that we may not needlessly repeat her unfruitful efforts. Let us profit by her experience as far as available, and take up the work where she has left it. We may do this, because the California insect is found to be identical with those of France, the vines are the same and our soils have been proved to act similarly.

No nation could have acted more energetically than the French people have in this cause; prompted, as they were, by its influence on the national wealth, and robbing them, as it seems inevitable it must, of their most remunerative and important industry. Great prizes were therefore held out to those who should invent or obtain a remedy for the phylloxera. The greatest inducements have, ever since the advent of the pest, been held out to individuals and companies to experiment and try every means within their power, with what result we shall proceed to examine. But the question arises, shall we go over the same ground that they have? Fearing the impetuosity and hasty propensities of our California farmers, I am induced to present in what may follow the result of the study of the remedies for the phylloxera as far as it has concerned France.

The Records of French Experience.

The French have innumerable publications on this subject running back into 1865 and beyond. Among these many books and pamphlets we see the evidences of millions of dollars which have been spent in experimenting with different substances. Many methods were introduced and some largely entered into as money-making schemes, which, on authoritative examination, proved worthless, or nearly so. Among those most prominent were the sulphocarbonate of potassium, mixture of the green and heavy oil of anthracene, numerous antiseptics and "Rohart cubes." These and the many more worthless remedies have now all been abandoned for the two complete and only remedies as yet discovered, which together satisfy all the requirements. These are, inundation from 20 to 30 days where the land is such that it may be flooded, and where not such, the proper application of the bisulphide of carbon.

Now, any substance which will fulfill the following requirements is a good remedy. These are: First, there must be an easily diffusible, toxic atmosphere formed underground, which will kill all the phylloxera and not injure the vine; second, it must not be too expensive, and with proper directions expedient to apply.

The sulphocarbonate of potassium destroys wherever it passes; it favors the construction of the vine and serves to revive the vine when nearly dead, but the requisite most difficult to satisfy with any remedy here arises how to completely saturate the soil with it. M. Mouillefert experimented largely in 1875, and after many endeavors reported as follows: "Out of the many ways in which it might be applied the following is the most feasible, viz., to dissolve the salt in water, and with this water deluge each vine, in fact, the whole affected portion of the vineyard. This treatment will cost at the least 600 francs per hectare" (about \$50 per acre).

The oils of anthracene were found not sufficiently strong to kill the insect, although all combinations and proportions were tried. At a late date the plan was suggested and carried into experiment, of mixing these oils with the bisulphide of carbon, this latter being known to be a certain destruction to the phylloxera, but

owing to its easy and sudden volatility, and also to the fact that it injured the vegetation when applied directly in excess, it was deemed of no use unless it was mixed in such proportions as to remove these two difficulties. This was the plan, therefore, and, carried into effect, became quite famous about 1876. The bisulphide killed the insect and the oil of anthracene served as a carrier. Now it becomes plainly visible that if a means could be devised of applying the bisulphide directly, it would save the expense of the oil of anthracene and also a portion of the energy of the bisulphide, which it was afterwards proved conclusively to be absorbed by the oil, as it caused a sudden diffusion of the vapor of the bisulphide at first and then retarded it so as to diminish its effectiveness as a destroyer of the phylloxera. Such a means was soon devised of applying this bisulphide directly without injury to the vine, and in consequence the mixture was abandoned.

Another carrier of the bisulphide of carbon was a cube of wood. This saturated with the liquid and placed near the root of the vine effected the partial destruction of the phylloxera. These formed the famous "Rohart cubes" (which were tried unsuccessfully at Sonoma, in California). With the cubes as with the mixture aforementioned, we may observe that when the application, direct, of the bisulphide itself, which was to work the destruction, could be had, the carrier became a useless expense and also served to weaken the force of the vapors while they continued. The Rohart cubes became important for a time and did a great deal of good, but were afterwards superseded by the pure bisulphide.

It will be seen that carbon bisulphide has, as the essential element of destruction, entered into nearly all the remedies which have been proposed, but its beneficial effects were canceled under the names applied to the various mixtures.

It was long known that inundation was an effective means to the end, but owing to the hilly nature of the vineyards in France it seldom became available; furthermore, it came to be known that the bisulphide of carbon was efficacious, the only question being as to the manner of its application—how to kill the phylloxera and yet not injure the vine? We conclude immediately, that the proper procedure was to make careful experiments and determine its effect. The French people did, too, but not until it had, as we have seen, been many times ineffectually combined with other substances. In 1877 the pure unadulterated bisulphide received official attention, and by the experiments which followed it became and is now an effectual remedy.

The Bisulphide of Carbon

(Symbol CS₂ consisting in 100 parts of 15.8 parts of carbon and 84.2 of sulphur) was discovered in 1796 by Lampadius at Freiberg. When pure it is a colorless liquid, strongly refractive and exhibiting extremely bright colors when in the sunlight; its odor somewhat resembles that of chloroform; the taste is aromatic. Its specific gravity=1.2684; the boiling point is 54° Fahr.; consequently the liquid is very volatile at the ordinary temperature of the air. As commonly used, somewhat impure, it has a very disagreeable odor.

The bisulphide of carbon does not combine with water or spirits of wine; in ether and chloroform, however, it is freely soluble; it is an excellent solvent for resins, essential and fixed oils, caoutchouc, gutta-percha, camphor, sulphur, phosphorus and iodine. It is highly inflammable, burning with a red-blue flame; the products of complete combustion are sulphurous and carbonic acids. The vapor of bisulphide of carbon with oxygen or air constitutes an explosive mixture. It is used largely at present for industrial purposes. These purposes are very varied, but consist chiefly of the vulcanization of caoutchouc, the extraction of fat from bones and oils from oil seeds and olives, the extraction of sulphur, which dissolves freely in it, from its concomitant rocks and of fat from crude wool. It is used in electroplating to obtain a bright and polished surface, and is highly valued for killing all kinds of vermin in corn and grass, and the destruction of gophers and squirrels, for which latter purpose it has been found very valuable to California, and large quantities were last year consumed for that purpose.

Enough of its chemical properties. As an insecticide it was completely tested in 1877-78 by the *Comité Regionale*, instituted at Marseilles under the patronage of the *Compagnie des Chemins-de-Fer de Paris a Lyon et la Méditerranée*. Their experiments, as far as is consistent with an article of this kind, I propose here to give; knowing their results to be those of accurate determination, and that by authority rendered reliable by the high standing of those who were engaged in the prosecution of this work. The authenticity of this report is further proved by complete reliance on their results by the National Committee of France and all of the many societies and associations instituted for the purpose of investigating the phylloxera question. They are also cited as authority by all writers subsequent to their determinations.

The report is divided into two parts. The first comprising all the experimental results of the committee itself, both on a small and those on a large scale. The second part is devoted to the work of vine growers and experiments of each individual who has in his own vineyard tried, on a large scale, the action of bisulphide of carbon. Among these are included the leading vine growers about Marseilles and L'Hérault, etc.

The report is opened by M. A. F. Marion (Professor of the Faculty of Science of Marseilles and delegate of the Academy of Sciences), and I will give a resume of his introduction. He speaks of the progress the bisulphide of carbon has made as an insecticide, of what the committee have in their work accomplished, as evidenced by the consumption of this chemical, up to December 31st of 1879, to the extent of 1,972 barrels (100 kilograms per barrel), or a total of 433,840 lbs. avoirdupois; and further, that their experiments have proved the following, which he gives as one of the results attained: A single application at the rate of 20 grams of bisulphide per square meter permits the survival of from 6% to 8% of the phylloxera. With charges of 36 grams there remains from 2% to 4%, and it is only by the employment of 55 grams per square meter, if confined to a single application, that complete destruction of the insect has been accomplished, and this amount greatly injures the vine and may kill it if already weak from phylloxera. On the other hand, by two injections, from 4 to 6 days apart and 10 grams per square meter each time, there is found only 1% of the phylloxera living; sometimes they are all killed. By making this a total in the two applications of 28 to 32 grams per square meter, the total extinction of the insect is affected and the vine suffers no injury, a result which in a single application requires from 50 to 55 grams and risks the vine besides. He further remarks on the necessity of conforming exactly to their directions in order to realize the beneficial results which they have obtained, namely, the complete destruction of the phylloxera without any consequent injury to the vines. As to the time best adapted to the operations, he states as a conclusion of study of the different transformations the insect undergoes, of its metamorphosis and periods during which it exists in the winged form, and consequently could not be attacked by a subterranean application, that in winter when all are underground, in whatever form that may be, they are best available to the insecticide bisulphide. Furthermore, the diffusion of the vapor, owing to the colder weather and the moist condition of the soil, and also its uncultivated state, is much less rapid, and this is a great desideratum; that the vapor shall not pass off so suddenly as to have no effect on the parasites. The effect of the reagent on the vine itself is no more in summer than in winter, though, perhaps, more apparent in the color of the leaves, which, if the dose be large, are apt to turn somewhat yellow, or lighter, but in a few days regain their vigor and original color. However, this is of all other times the best, namely, during the winter before the agitation of the soil has begun by plowing. In the summer the phylloxera takes wings and does not enter the ground again until the last week of May. As soon, therefore, as they have gone down on to the roots another application is necessary, and this, the last, equal to the first in amount, completely terminates their existence. Because of the higher temperature of the summer the two successive applications, which in the winter should be 6 days apart, should in the summer be only 4 days apart. To sum up then, the bisulphide should be applied in doses of 14 to 16 grams to the square meter (usually put into two holes on opposite sides of the vines, 7 to 8 grams to a hole). Two such applications about the last of November or during December, with an interval between of 6 days; then again, soon after the month of May, repeat this double dose of 7 to 8 grams each to the square meter, with an interval of 4 days between the first and second application.

Mr. Marion closes his introduction by saying: "We are now permitted, after the operations which we have completely examined, to say that we are in possession of an efficacious method which has by practical proof resisted all difficulties; we do not desire that our statements appear preclusive nor prejudicial, but from all the proof we are convinced that the bisulphide of carbon will play the part of the all-important remedy in this great struggle against the phylloxera, in which no well wisher of our agricultural interests will be disinterested."

I will here remark that, in relation to the times for the best application of the bisulphide, the climate of California being very much similar to that of France, we may suppose that the changes which the insect undergoes are the same in California, and that the best times for the application would be similar—this is not definite, however, and until ascertained, we may have to rely principally upon the winter time, during which we are certain of catching all of the phylloxera within the area treated.

After the introduction by Mr. Marion, comes the "first part," in which are detailed experiments and the results obtained. These experiments I will, in the next issue, give more or less in detail. I will also sum up all the directions relative to the proper handling of the bisulphide of carbon, the instrument by which it may be injected into the ground, the dangers arising from its use (it being explosive and poisonous) and all that may apply particularly to California respecting the expense of using it, our plan for its immediate manufacture on this coast, and all else which may appear necessary on the subject of the remedy.

JOHN H. WHEELER.

San Francisco, Cal.

The recent large advance in lead and copper has greatly stimulated exploration and development in this class of mines, which promises to become one of the most important branches of mining on the coast.

Utah Mines.

"What's the mining outlook for Utah," asked a *Tribune* reporter of one of our prominent mine owners yesterday.

"The outlook is bright, was always bright, in this Territory, if men would only realize what they've got."

"What do you mean about realizing what they've got?"

"Why I mean this: If any other Territory or State in this Union turned out the same amount of refined bullion that we do right here, every man having an extra dollar to invest, would be breaking his neck trying to get there. But here we are actually shipping more bullion than Colorado, and yet you cannot pick up an Eastern paper that has not something to say about that State, but not a word about Utah. Look at your bullion receipts. The *Tribune* tells the whole story every morning in the 'City Jottings.' Money talks the world over, and we are turning out the money and doing it so quickly that men don't realize it."

"Have you seen the mine of Colorado?"

"I have been over the whole State. Why you don't suppose I am here for my health do you? The climate of Colorado is as good as this and the facilities for sliding out of there are better than they are here. That State is being cut up by railroads and towns are springing up every day. The class of people there are better than ours, and a man can get more fun for his money than he can get here. But that is all right. I am not ready to retire from business yet, and while I have any money to invest, Utah is my field."

"You feel that Utah, as a mining region, offers all the inducements capitalists require; but you must remember that the activity in mining matters here will not bear you out in your enthusiasm."

"I am enthusiastic because I am successful. If you mean by activity stampedes created by land speculators or railroad corporations, I am willing to admit what you say. But don't you stampedes. Where is the mine in Colorado that can show up like the Ontario, where is the camp in Colorado that yields bullion like Silver Reef and Frisco? There is not in the whole State of Colorado as much ore as there is to-day in sight and on the dumps of the mine around Frisco, Colorado! Why it's enough to make a mining man sick to read the exaggerated reports we read of that State every day in those Eastern mining papers. Colorado men will borrow \$20,000 to make a shipment and then go in debt \$5,000 advertising the shipment. Did you ever hear of Greg Chambers, Capt. Lubbock, the Stormont folks or the Horn Silver people paying out a cent to advertise the output of their mines? Not much."

"You have funny notions of your own on mining matters, but—"

"There you go. You ask me for my views and then laugh at them; but I have made money by my notions, as you call them, and am certainly very well pleased. You can etate in your paper that they may roam from the Gunnison to the Pole, and wander as far out of the way as they wish, mining men and capitalists have right here in Utah more ore to the square acre than any mining country I've been in, and I have been in every one of them that amounts to anything."

Our reporter left with the thought that if one-half of Utah's mining men were as sanguine as that man, they might make it lively in our mountains, even though they were not half as successful.—*Salt Lake Tribune*.

Increase of American Production.

The following table, showing the great increase in production in the United States during the last 20 years, has been compiled by the Hon. J. Hay, Assistant Secretary of State for the United States:

TWENTY YEARS' INCREASE IN PRODUCTION IN THE UNITED STATES.			
	1860.	1880.	Increase per cent.
Population.....	31,443,321..	43,500,000..	55

CURIOUS FIGURES.—Baron Kolb, a German, who has been ransacking the figures of the universe, says that the English is the most widely spread language, being spoken by about 80,000,000 people; German by 50,000,000 or 60,000,000; French and Spanish, 40,000,000 each; Russian, 55,000,000. Every advance made by a people in morality and healthy employment and useful knowledge adds to its tenure of life. The average of life among the well-to-do is 50 years, among the poor 32 years. Clergymen average the longest lives—66 years. Idlers are shorter-lived than the industrious, and statistics prove that in countries where consanguineous marriages are permitted there are to be found a greater number of deaf mutes and idiots than elsewhere.

THE ENGINEER.

Improving the Upper Mississippi.

The scheme for improving the Mississippi river by means of what is known as the reservoir system, though less talked about than when first advanced, has not been allowed to languish. It has been steadily and persistently pushed, and measures are now fairly under way for giving it a practical test. Col. Platt B. Walker, who has recently visited Washington in the interest of the project, has recently returned to Minneapolis with copies of official charts showing the results of surveys and the details of the proposed improvement. The first dam, for which a congressional appropriation of \$75,000 was obtained, will be built across the Mississippi at its outlet from Lake Winnebago, and its construction will be commenced as soon as an arrangement can be made with the Indians of the Leech Lake reservation, upon whose reserves the contemplated improvements are to be made. This dam will be 1,114 ft. long, 14 ft. high, and will flood the country for 20 miles back, holding sufficient water to effect quite perceptibly the stage of water through the dry season. Of course this is but a small portion of the projected improvements; but a large number of such dams can be constructed, with sufficient capacity to maintain a navigable stage of water, throughout all the region now seriously affected by the drouths of summer.

JAPANESE RAILROADS.—The following is the present state of railways in Japan: A line from Tokio to Yokohama, 18 miles in length, was completed early in 1873, and has not since been extended. Since that time a railway from Higo to Osaka, 22 miles long, and about 230 miles south of Tokio, was built and afterwards extended to Kioto. Still more recently a further extension was made to Otzu, on the south bank of Lake Biwa. These include all the railways in Japan, the length being about 60 miles. Another line has, however, been commenced from Tokio to Mayebashi, more than 60 miles long. This railway, the construction of which offers but few difficulties, will be of great commercial importance. A railway is projected in the northern island, and it is in contemplation to extend the southern system from Kioto to Lake Biwa, and for some distance up the center of the island.

THE ENGLISH CHANNEL TUNNEL.—It is said that within 18 months 2½ miles of the channel tunnel between England and France will have been excavated, and that the work will be completed in four years, probably by boring from each end. There are evidently, however, contingencies, such as a break in the rock, which may destroy the whole enterprise. Meantime another bold scheme for crossing the channel contemplates a line of steel tubes 16 ft. in diameter, ballasted so as to make it weigh one and a quarter tons to a foot less than the water displaced, and beld at the depth of 35 ft. below the surface (so as not to impede navigation) by being anchored by chains or caissons sunk to the bottom. Through this floating tunnel of 20 miles or so it is proposed that railway trains shall pass. The scheme appeals too strongly to credulity.

THE EAST RIVER BRIDGE.—The great East river bridge between New York and Brooklyn is still in course of construction, and much remains to be done. The steel for the roadway which is to be hung from the cables is not yet delivered. The stone work on the approaches is expected to be finished by Dec. 1st; one large building remains to be torn down, the elevated railway station in Chatham street will have to be removed and a bridge must be built over the elevated road at Franklin square. The Brooklyn approaches are also yet to be constructed. The approaches on both sides of the river are expected to be fully completed in about six months, unless the weather is so severe as to retard the mason work. The engineers had hoped to have the bridge open to the public on July 4, 1881, but the delay in getting the structure has disappointed them so that they do not expect to finish it until Sept., 1881.

THE ISTHMIAN SHIP RAILWAY.—Capt. Eads is in earnest about the construction of a ship railway across either the Isthmus of Panama or of Tehuantepec. As to the feasibility of the enterprise he entertains no doubt. To illustrate the sincerity of his convictions, he was to have sailed from New Orleans on the 4th inst., with a party of engineers, who will examine the Isthmus of Tehuantepec, in order to verify the Captain's opinion as to its suitability for the work proposed. It is said, Capt. Eads will, at the same time, endeavor to secure Government sanction for his proposed survey, and to ascertain what the Mexican Congress will be willing to do if he decides to build the railway.

ENGINEERS' CONVENTION.—A very interesting convention of surveyors and engineers, resident in Pennsylvania, is now in session in Harrisburg, the call having been issued by the Engineers' Club of Philadelphia. The topics suggested for discussion by this body were wholly technical, and refer to revision of the laws so as to provide for periodical tests of surveyors instruments, the establishment of standard meridians in each county, a uniform system of fees and compensations to surveyors, a geodetic survey of the State, the creation of a Board of State Engineers, etc.

USEFUL INFORMATION.

Chrome-Tanned Leather.

It is stated by *Engineering* that an important improvement in tanning leather has been brought out in Germany which promises to be of great importance, as it dispenses with the ordinary tanning materials. Dr. Christian Heinzerling, of Frankfurt-on-the-Main, is the inventor. His process involves the use of inorganic chemical compounds only, the special member of which is bichromate of potash. Generally speaking it may be said that the other compounds, all of which are readily soluble in water, have as their function the decomposition of the bichromate of potash, so as to set free its contained chromic acid, which is really the chemical agent that exerts the tanning effect on the tissue forming the corium or lower layer of the animal hide. There are many considerations which seem to justify us in expecting great results from the adoption of the Heinzerling process. One leading fact is, that it requires for its completion a period of only from four to five or six weeks, whereas the bark-tanning process requires from 12 to 20, or occasionally, even 30 months for its completion. It has already been adopted in 14 tanneries in Germany, and is being introduced into Russia, Belgium, France and Italy.

It is claimed that chrome-tanned leather has several properties which render it superior to the bark-tanned, the upper leather being more elastic, tougher, and very enduring. It is closer and finer in the grain than bark-tanned leather, the weight of the two descriptions being equal. It is also said to be much more impervious to water than any other. A prominent citizen of Biedenkopf says: "I have given the leather a trial, and now beg to state my opinion of its quality. I have been able to test them in the heavy snow, through which we have been obliged to walk through the forests, etc., and never had wet or damp feet, as was invariably the case with bark-tanned ox leather and calf leather. I must draw attention to the fact that during the whole time I never used any sort of grease, and to-day the boots are as soft as at the beginning. I then tried, after walking long distances through snow and rain water, putting the boots before the warm stove to dry, and found to my great surprise that the leather did not get hard, as it does in the case of bark-tanned leather. I may just add that I never had a pair of boots that kept out all dampness and were as strong as those made of chrome-tanned leather."

PARAFFINE AS A PROTECTION TO WOOD AND IRON.—A German scientist recommends paraffine as an efficient means of protecting wood against damp, acids and alkalis. The wood is first well dried, and then covered with a solution of one part melted paraffine in six parts petroleum, ether or bisulphide of carbon. The solvents evaporated quickly, leaving the paraffine in the pores of the wood. Great care must be taken in the use of this preparation, as paraffine, as well as petroleum, ether or bisulphide of carbon, is especially inflammable; and even the vapor of the two last mentioned substances, if mixed with air, may give rise to dangerous explosions. Paraffine melted, with equal parts of linseed oil and rapeseed oil, is also very useful to protect iron from rust.

FINE LINEN.—According to the *Building News* a piece of linen has been found at Memphis containing 540 picks to the inch, and it is recorded that one of the Pharaohs sent to the Lydian king, Croesus, a corselet made of linen and wrought with gold, each fine thread of which was composed of 360 smaller threads twisted together! The ancient Egyptians wove a fabric called the "linen of justice," or "justification." So beautiful and valuable was it that it was esteemed the most acceptable offering to the "Restorer of Life." A few hand looms can be seen at work in the Eastern bazaars of Cairo, the cloth woven in which rivals in texture, color and design the finest glass screens of Munich.

CAOUTCHOUC dissolves more or less perfectly according to its condition in various liquids; among which may be mentioned the various fixed and hydro-carbon oils, chloroform, ether and carbon-disulphide. Unless, however, the caoutchouc has been masticated or otherwise degenerated, it is doubtful whether a true solution is obtained. When a clear, limpid solution is required, one of the best solvents is that proposed by Payen, namely, carbon-disulphide, mixed with 5% of absolute alcohol. If one part of masticated caoutchouc is dissolved in 30 parts of the above solvent, a solution is obtained which can be filtered through paper, and may be employed in covering the most delicate mold with layers of caoutchouc.

ODORLESS BENZINE.—Ten gallons benzine mixed with one gallon cottonseed oil, subjected to slow distillation till nine gallons have come over, yields a benzine which evaporates without leaving any smell. The same oil can be used three times, but then seems to become so impregnated with the impurities of the benzine as to lose its effect.

MARINE GLUE is made by melting together one part of unvulcanized caoutchouc, first softened or dissolved in cool naphtha, and two parts of shellac.

HOW CHICKENS GET OUT OF SHELLS.—Take an egg out of a nest on which a hen has had her full time, carefully holding it to the ear; turning it round, you will find the exact spot which the little fellow is picking on the inside of the shell; this he will do until the inside shell is perforated, and then the shell is forced outward as a small seal, leaving a hole. Now, if you will take one of the eggs in this condition from under the hen, remove it to the house or other suitable place, put it in a box or nest, keeping it warm and moist, as near the temperatures of the hen as possible (which may be done by laying it between two bottles of warm water upon some cotton or wool), and lay a glass over the box or nest, then you can sit or stand, as is most convenient, and witness the true *modus operandi*. Now watch the little fellow work his way into the world, and you will be amused and instructed as I have often been. After he has got his opening, he commences a nibbling motion with the point of the upper bill on the outside of the shell, always working to the right (if you have the large end of the egg from you and the hole upward), until he has worked his way almost around, say with one-half of an inch in a perfect circle; he then forces the cap or butt end of the shell off, and then has a chance to straighten his neck, thereby loosening his legs somewhat, and so, by their help, forcing the body from the shell.

DIAMOND CUTTING, formerly monopolized by Amsterdam, is now done so much better in New York, that many of the best Amsterdam cut gems are sent to New York to be recut and returned. The Amsterdam cutters aim to diminish the weight of the diamond as little as possible; the American plan is to cut mathematically, according to recognized laws of light, thus developing to the utmost the brilliancy of the gem. The average increase of value given to diamonds by the New York cutting is \$5,000 for each person employed for 12 months.

A NEW OIL FROM GRAPEVINES.—M. Laliman, a French savant, has discovered that an oil can be distilled from the American vines which will not congeal above 8° Fahr., while other oils congeal at 27½ Fahr. M. Laliman, therefore, recommends this oil for watch-making and similar uses.

VERMIN IN BIRDS.—A lady "who loves birds" writes us that to rid canary birds of vermin, put 10 to 15 drops of carbolic acid into about a quart of warm water, and bathe the bird quickly therein. Scald every portion of the cage and perches and wash with the acid and water.

HORSE LEATHER, it is reported, has been officially adopted as the material of which the boots issued to sailors of the German navy are in future to be made, experiments in the use of this material for the past 18 months having been so satisfactory that calf skin is to be abandoned.

GOOD HEALTH.

The Secret Out.

A very imprudent physician has done his brethren a great injury by thoughtlessly divulging one of the most valuable secrets of the profession. "How is practice now? you must be making a great deal of money, for every third person seems to be ailing?" "True; there is much serious sickness, but I get no practice. The panic has made the times so hard, that people cure themselves by eating nothing."

There are few bodily ailments which are aggravated, and in some cases rendered incurable by insufficient diet; but with the exception of diphtheria and a few others, nine out of ten of all ordinary ailments are controlled, are arrested, are permanently cured by a wise diminution of the amount of food eaten. This is particularly the case when there is no decided ailment, but a general feeling of discomfort or of unwellness. In all actively inflammatory maladies, where there is acute pain any where, total abstinence from all substantial food, from everything liquid or solid, except hot teas, is the sheet-anchor of safety, when not extended beyond 36 hours. No one should venture on a longer abstinence on any occasion without the advice of a physician.

All pain is caused by over-distended blood-vessels pressing against some neighboring nerve. Hence the quickest way of relieving any ordinary pain is to diminish the amount of blood in the vessels of the part by bleeding. But there is a safer, a better and a more enduring relief in cutting off the supply of blood; and as blood is made out of the food we eat, it must be apparent, that if on the feeling of pain or discomfort, we cease eating absolutely, that pain must begin to diminish within six hours, that being the time required for converting food into blood, and if no more food is eaten no more blood can be made, while if the amount in the system is diminished at the rate of two or more pounds in every 24 hours of invalidism, there must soon be relief.

A USEFUL TOOTHWASH.—Moisten the brush on a piece of lime or lemon and rub the teeth and gums well; then rinse with water, which will not only clean the teeth, but improve the breath. If any of our readers consider the above injurious to the teeth, we would like to hear from them.

Coffee Drinking.

How strong should coffee be taken? is an inquiry of much practical importance. How much should be taken at a meal? is scarcely of less moment. Coffee, like any other beverage, may wholly ruin the health; the very use of it tends to this ruin as certainly as does the use of wine, cider, beer or any other unnatural stimulating drink. There is only one safe plan of using coffee, and that is, never, under any circumstances, except of extraordinary character, exceed in quantity, frequency or strength; take only one cup at the regular meal, and of given, unvarying strength. In this way it may be used every day for a lifetime, not only without injury but with greater advantage than an equal amount of cold water, and for the same reason that nothing cold should be drunk at a regular meal, except by persons in vigorous health.

One pound of the bean should make 60 cups of the very best coffee. If a man takes coffee for breakfast only, one pound should last him two months, or six pounds a year.

One pound of coffee should be made to last a family of 10 persons, young and old, one week. Put about two ounces of ground coffee in a quart of water, or rather divide the pound into seven portions, one for each breakfast in the week, and make a quart of coffee out of it, which will be 64 tablespoons. Give the youngest two tablespoonsful and the oldest a dozen; the remainder of the one cup being filled up with boiled milk. This will give a cup of coffee sufficiently strong for all healthful purposes, for the respective ages; and for various reasons, pecuniary as well as physical, some such systematic plan as this should be adopted in every family in the land. How to make a good cup of coffee? is a third question. It is perhaps as good and as easy a plan as any to buy the coffee in the grain, pick out those that are imperfect, wash it, parch as much as will last a day or two, with your eye upon it all the time until it is of a rich brown, with no approach of black about it. Grind enough for the day's use; grind it fine, for the greater the surface exposed to the hot water the more of the essence you will have; pour the boiling water on the coffee, close it up, boil it 10 minutes, let it stand to clear 10 minutes, then use.

There are additional devices for husbanding the aroma, but as people who are so very particular about every thing they eat being done to the nicest shade, are but a shade above the brutes, and generally die 20 years before their time of inanition, of chronic diarrhea, it is not thought important to initiate the readers of this journal any further into the mysteries of coffee-making and drinking.—*Journal of Health.*

EFFECT OF PERFUMERY ON HEALTH.—An Italian professor has made some very agreeable researches, resulting in the discovery that vegetable perfumes exercise a positively healthful influence on the atmosphere, converting its oxygen into ozone and thus increasing its oxidizing influence. The essences found to develop the largest quantity of ozone are those of the cherry, laurel, clover, lavender, mint, juniper, fennel and bergamot; those that give it in smaller quantities are anise, nutmeg and thyme. The flowers of the narcissus, hyacinth, mignonette, heliotrope and lily of the valley develop ozone in closed vessels. Flowers destitute of perfume do not develop it, and those which have slight perfume develop it in small quantities. Reasoning from these facts, the professor recommends the cultivation of flowers in marshy districts, and in all places infested with animal emanations, on account of the powerful oxidizing influences of ozone. The inhabitants of such regions should, he says, surround their houses with beds of the most odorous flowers.—*The Mechanic.*

SUDDEN DEATH.—The chances of escaping sudden death are nearly two to one in favor of women. Death always begins at the head, the heart or the lungs; therefore,

1. Keep the head cool by taking the world easy.
2. Keep the lungs breathing deeply and fully about 17 times a minute, by cultivating alacrity in all the bodily movements.
3. Keep the heart heating about 68 times a minute, that is, let the pulse heat four times while the lungs breathe once, by eating temperately, sleeping fully and soundly, exercising moderately and avoiding all temporary excitants, mental or liquid.

THE TREATMENT OF RATTLESNAKE BITE.—A professional snake catcher of Holyoke, Mass., treats rattlesnake bites as follows: He first ties a cord tightly around the member bitten, so as to cut off the flow of the blood toward the heart. The bleeding wound is then sucked out thoroughly to withdraw as much of the poisoned blood as possible, after which strong spirits of ammonia is applied. After a while the string is loosened a little to allow the remaining poison, if any, to be so slowly absorbed into the system that no serious results are likely to follow.

TROPICAL DISEASES.—The *Journal of the Society of Arts* for February has a paper on the tropical diseases and the proper means of avoiding them. Sojourners will not adapt their food to the new conditions of a warm climate, but "stuff themselves" as before, instead of imitating the natives of the country. Common sense teaches people at home to eat less in summer than in winter; and this rule would be the proper one for the tropics. The author recommends diet and moderate exercise, instead of feeding and resting and taking quinine.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Academy of Sciences; Influence of Cages in Mine Ventilation; A New Double Drum Mine Hoist, 289. The Week; Local Manufacturers; Loss of Life in Mines; New Water Supply for the City of Oakland, 296. The Scenery of the Columbia River; New Dredging Machinery; The Mining Laws, 297. Patents and Inventions; Notices of Recent Patents; A Growing Vice, 300.

ILLUSTRATIONS.—Double Geared Hoist for Round Wire Rope, 289. La Tourelle Falls on the Columbia River, 297.

MECHANICAL PROGRESS.—The "Anthracite"; Hardened Steel; Economic Production of Steam; Early Iron Making in England; New Treatment for Zinc, 291.

SCIENTIFIC PROGRESS.—Practical Value of Science; Change of Climate in the Sierras—The Cause; Phosphorus in Iron; Electric Light Improvement; A Phenomenon of Elasticity, 291.

NEWS IN BRIEF. on page 293 and other pages.
THE ENGINEER.—Improving the Upper Mississippi; Japanese Railroads; The English Channel Tunnel; The East River Bridge; The Isthmus Ship Railway; Engineers' Convention, 295.

USEFUL INFORMATION.—Paraffine as a Protection to Wood and Iron; Chrome-Tanned Leather; Fine Linen; Odorless Benzine; A New Oil from Grapevines; Vermin in Birds, 295.

GOOD HEALTH.—The Secret Out; A Useful Tooth-wash; Coffee Drinking; Effect of Perfumery on Health; Sudden Death; The Treatment of Rattlesnake Bites; Tropical Diseases, 295.

MINING SUMMARY. from the various counties of California, Nevada, Arizona, Idaho, Utah, Montana, Oregon and New Mexico, 282-3.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 282.

MISCELLANEOUS.—The Profusion of Life; A Railway in the Rocky Mountains; An Asiatic Mint; A Great Quartz Mill, 290. The Remedy for the Phylloxera—No. 1; Utah Mines; Increase of American Production; Curious Figures, 294. New Way of Gravel Mining; Executing Criminals by Electricity; Rich Gold Quartz, 298.

Business Announcements.

Dodge's Unequalled Concentrating Machinery.
Gold Quartz Mine for Sale.
Dividend Notice—Standard Consolidated Mining Co.

The Week.

The mining news this week, though abundant enough, does not indicate any new features in the situation. On the Comstock no bonanzas have been struck, and there are no special indications of any near at hand. As a consequence the share market keeps dull, as it has been for a long time.

The all-important and overshadowing event of the week has been the Presidential election, and it is highly probable that everybody, including the candidates, is heartily glad the botchy contested campaign is over.

So far no indications of rain have shown themselves, but the hydraulic miners are pretty generally prepared for it. The quartz miners, in the more elevated and colder districts, have already provided themselves for the winter. In these latitudes pleasant warm weather has been the rule for a week or so.

Now that election is over, we hope those who have had their attention occupied by the campaign, and who are interested in mining, will return with renewed vigor to the development of their properties, so that California will continue to hold her second place in the list of bullion producers.

No official report has yet been made of the receipts of the late Mechanics' Institute fair, but we are informed unofficially that about \$14,000 will be cleared over and above all expenses.

The Empire mine at Grass Valley, which was abandoned a few years ago, is being pumped out. The water has already been lowered to the 800 level, and will be still further lowered to the 1200 level.

The *Santa Independent* says that to satisfy a number of judgments, the Eureka mine, Como, will be sold at public auction on Saturday, November 13th. San Francisco parties are expected to make the purchase.

Local Manufactures.

We hope from this on to see California take a better position as a manufacturing center than she has hitherto done. Rates of interest have materially lessened, the country is more thickly populated, means of transportation have increased and improved, and the State has "waked up" generally. It takes time to develop an industry of any magnitude, and it also takes a good deal of money and energy to start it. But we have the energy and the money, and now is the time. There are a good many small towns throughout the State where no particular impulse has been given to any branch of business that can be widely developed, and in any one of these places, if a start were made and a manufactory established, it would not be long before that establishment would make a name for itself if managed properly.

It has been noticed that when a certain kind of manufacturing industry has started up in a small town or new settlement, it finally becomes the prominent industry of the town. Hundreds of Eastern and European towns indicate this. Some are famous for iron work, some for cars, some for clocks, knives and forks, toys, brass goods, firearms, etc. We haven't any of these places in this State, yet they are the localities which make other communities prosperous.

Most of the manufacturing industries of the State of any magnitude are concentrated in San Francisco. The small towns have been left out in the cold, and have to depend on the agricultural or mining communities near them for support; and, unfortunately, the result has been that very few of the interior towns are in as prosperous a condition as they should be.

Manufacturing establishments of any character must first acquire a local reputation, and this will in time spread as their business increases. San Francisco is now mainly noted, from a manufacturing point of view, for its mining machinery and its woolen goods. The woolen mills have sent their products all over the coast. The foundries, from small beginnings, have multiplied in number and in usefulness, and have for some years manufactured mining machinery, not only for the Pacific Coast States and Territories, but for Mexico, Japan and South America. California has set the pattern for mining machinery of all kinds, making it hotter and cheaper than elsewhere.

Of course, there are many other branches of manufacture in this great city, which are prosperous and flourishing, and which are gradually becoming better known. The plea we are making now is for similar works to be started in the interior towns. Low rents, cheap living and convenient facilities may be had in many places. Any of these communities will give any assistance in their power. Let the new industries grow up with the country, starting in some small town, and developing gradually with its growth a class of population who shall be producers in a branch requiring skill, mechanical knowledge and ingenuity. Nothing will make us more prosperous than this. Agriculture and mining are very well in their way, but we must educate mechanics and artisans, or it will take all the miners and farmers make to pay for appliances and materials which they need.

TIN MINES IN MAINE.—Referring to our recent article on tin mining in Maine, says the *Scientific American*, a correspondent in that State writes that the promise of the mine at Winslow continues to be most encouraging, indeed far better than that offered by the best Cornwall mine at an equal depth from the surface. He adds that "with every day's work the seams are widening and rapidly converging toward what must at no great depth prove a champion vein of large dimensions." Our correspondent is of the opinion, however, that the western portions of the State give indications of more valuable deposits of tin. In this region are extensive belts of gneissoid ledges interspersed with fluor spar, and in several places in Cumberland county fine specimens of cassiterite have been taken from what appear to be well defined seams. Some of these seams were laid open in rock cuttings for railways some years ago, but those who did the blasting knew nothing of mineral ores, and the geologists were looking for other things.

NEW CONCENTRATING MACHINERY.—Mr. Miles B. Dodge, of this city, who has an improved concentrator of his own invention at work at No. 143 Fremont St., has been doing some very good work with his machine lately. He recently concentrated 1,690 pounds of gold quartz from the Last Chance mine, Mariposa county, down to about seven and one-half lbs., and out of this obtained \$84.78 in gold. This same ore only worked \$20 per ton in the mill; but after being concentrated and properly worked the result was very satisfactory. Mr. Dodge says he is prepared to demonstrate to those who will send their ores to him, that he can obtain with his concentrator from 25% to 100% more than any other machinery now in use.

The troublesome bar which has formed at the mouth of Feather river—known as the Fremont Bar—has been considerably improved by the building of over 1,000 ft. of wingdam at that place, under the supervision of Colonel Mendell.

Loss of Life in Mines.

We have not, in this country, any government mining commission, or any official organization of any kind for collecting statistics connected with mining. The office of U. S. Mining Commissioner was abolished some time since, and to the Director of the Mint was left the duty of collecting statistics of production of the precious metals. The U. S. Geological Survey, as at present organized, is engaged in collecting information concerning mines, but it exercises no supervising functions whatever. Any kind of machinery can be used—good or bad; and any plans carried out without danger of hindrance from either Government or State officials. There is no means, therefore, of our getting at the proportionate loss of life to the number of men employed, or to the product of the mines. We do not know whether it is greater here than in Europe, or whether the accidents which cause loss of life are greater in one class of mines than in another.

In Europe, statistics of this character are carefully kept, with a view to lessen, if possible, each year the loss of life by investigating the causes and providing remedies. Comparisons between the systems in vogue in different districts and different countries can thus be made, and the best one adopted.

At a recent meeting of the North Staffordshire Mining Institute, in England, Mr. R. A. Sawyer gave a comparison of the proportion of lives lost to the number of persons employed, and to the output in Great Britain and Ireland, and Prussia. In 1878, in Great Britain, there were 103,183 tons of mineral raised per life lost, and for every life lost there were 336 persons engaged. In Prussia, there were 401 persons employed and 95,868 tons raised for every life lost. But 1878 was an exceptionally fatal year in England, owing to two large explosions, which together caused the death of about 450 persons. Taking previous years, it was found that England was far in advance of Prussia respecting the proportion of lives lost to the number of persons employed. Thus, in 1877, there were 409 persons employed in Great Britain and 407 in Prussia for every life lost; in 1876, 551 to 378; in 1875, 430 to 333; in 1874, 510 in Great Britain to 377 in Prussia. How was it that, notwithstanding the technical education possessed by all in authority in Prussia, the comparatively small depth of many of its mines, and its stringent mining laws, how was it that the death rate was so much smaller in Great Britain than in Prussia? He believed it was the result of the English Coal Mines Regulation Act and the most practical system of inspection for which it provided. In Prussia the system of inspection was bad.

In this country we haven't any system of inspection at all. If the hoisting works' cable breaks and drops a dozen or so men down a shaft, their families have a chance to sue the company, and if the company have anything and the jury thinks proper, the heirs get damages. Oftener they don't, however, and the whole thing "blows over." Our investigations of these disasters seldom amount to much, and any attempt to provide against them is left wholly to the mine managers, no Government or State officials having any authority to call attention to deficiencies or enforce any regulations which shall protect life. As before stated, we can make no comparisons with systems of mining in other countries, as affecting loss of life, simply for the reason that we have no full statistics here upon which to base a comparison.

A few weeks ago an old prospector named Alexander Swift, who had gone into the Skagit mines to seek for gold, was found by miners wandering in an almost famished state among the mountains of that inhospitable region. He had been out for 29 days, and was taken into camp, fed, clothed and started on the way toward the town of Fort Hope, on the Frazer river. He never reached that place. News has been received that the body of the lonely old man had been found near the boundary line between the United States and the British territory, wrapped in its blankets and bearing evidence of having been dead many days. The discovery was made by an Indian. Swift has many friends in San Francisco, who will be saddened to hear of his miserable end.

The North Bloomfield gravel mining company has declared a dividend of \$1 per share, payable on the 5th. This is the 16th dividend, and aggregates \$45,000. The previous 15 dividends aggregated \$180,000. It took a long time to accomplish this, however, a great many successive assessments having been paid before the mine was put on a paying basis. The North Bloomfield is one of our representative hydraulic mines.

The steamer *Princess Louise*, from Fort Wrangel, brought 150 passengers to Victoria from the Cassiar mines. She experienced a hurricane on her voyage down and came very near being lost.

The deposits of bullion for coinage at the San Francisco mint for October were: Gold, 123,822 ounces; silver, 990,525 ounces.

New Water Supply for the City of Oakland.

(Written for the Press by A. V. D. N.)

Near the summit of the Coast Range dividing Alameda and Contra Costa counties, six or seven miles north of the city of Oakland on the Morago Valley road, is situated the property known as the Luch's ranch. On this ranch and near the road above named, a tunnel was started in the side hill, about four years ago, with the purpose of prospecting for coal. After more than two years of persevering and unremunerative labor, for no coal was found, and an expenditure of many thousands of dollars, the company was about to withdraw from the field when a last attempt was decided upon, and a winze ordered to be sunk from the extremity of the tunnel. After a few days' work, instead of striking coal, the astonished miners met with a stream of water so powerful, that they had to flee for their very lives; and planks, timbers, wheelbarrows, picks and shovels were washed out of the tunnel with a frightful velocity. The company, being apprised of the fact, went out to see the phenomenon. After having tasted the water, ascertained its quality by analysis and determined by further investigation that the extent of the underground water basin was of considerable magnitude, the idea of supplying the city of Oakland with pure water originated with the owners of the tunnel. They at once sent for Mr. John Graham, an expert in water works, to have his opinion about the feasibility of supplying the city of Oakland with pure water from the tunnel. Mr. Graham was formerly the superintendent of the Temescal reservoir. This reservoir with its enormous dam was built by Mr. Graham, who also laid the distribution mains clear into Oakland. This Temescal water system, a part of the Chabot water supply, having proved a success in every particular, and no accident whatever having happened during the construction of the works, the tunnel company thought that Mr. Graham would be the proper person to take charge of its works, if it was deemed advisable and profitable to erect them. Mr. Graham, moreover, had built successfully a whole system of water works near Edinburgh, in Scotland, at a place named Dunbar, and also has erected water works for the village of Worcester in New York State, this country. Mr. Graham, after considerable investigation of the tunnel water supply, and of the water shed between the summits, which is over 10,000 acres, with many beautiful springs oozing from the hillsides, concluded that water enough could be accumulated there to supply the city of Oakland with its future extensions for 40 years to come. Mr. Graham, after mature reflection, proposed a double system of supply, which is at present under way of being carried out. The magnificent water coming from the underground basin in the tunnel, so delightful in its quality and coolness, would be carried to Oakland in a separate system of mains to be used for drinking and culinary purposes only. The water derived from the springs in the hillsides, and from the rain shed (the lands here are all rock and gravel) although of as pure a quality as those of the San Francisco Spring Valley, would be carried in separate mains to Oakland to serve for laundry purposes, washing carriages and irrigation, and also for the extinguishing of fires occurring in the city. These last waters would be kept in a gigantic reservoir, formed by a dam 150 ft. high, erected at a place in the canyon 725 ft. above the grade of Oakland. As the waters of this reservoir would be conducted directly to the city in a 16-inch main pipe, it is expected that the pressure would be such as to need no fire engines in case of fire to throw the water on to the highest building possible. This, it is expected, would be a great saving to the city, and this alone would be a feature to commend it highly to the favor of the inhabitants of Oakland. Mr. Graham has commenced the construction of the work in earnest and has been actively at work building a cement and brick-work reservoir to receive the pure waters from the tunnel as they flow out of it. This reservoir, or kind of filtering basin, is intended to catch any gravel or small stones that might be kept in suspension through the velocity of the tunnel waters. These on leaving the basin will be carried through a 12 inch pipe into a reservoir built of masonry and cement, situated near the Deaf and Dumb Asylum, opposite Judge Garber's place. This reservoir is 430 ft. above the level of the city of Oakland, is 150 ft. in diameter, 60 ft. deep and at a distance of four miles from Oakland. The grading for a line of pipes leading from the filtering basin to the reservoir is being dug along the sidehills, and will soon be ready for the laying of the pipes. Soon after this work is performed, and while laying the pipes to conduct the tunnel water to Oakland, the erection of the immense dam across the canyon will be commenced. We expect at some future day to publish in this paper, illustrated with plans and profiles, the whole scheme of the Summit water works to serve as instruction to the interior towns who have not the good fortune of having at hand such a practical man as Mr. John Graham.

The California and Ophir mines have made a connection between the 2000 and 2300 levels.

The Scenery of the Columbia River.

There will soon be published by the Continent Stereoscopic Co., of New York, an illustrated tour descriptive of the upper Pacific coast, entitled "Picturesque Northwest," by E. Conklin, of the Frank Leslie publishing house. It is pronounced by a New York critic, who has seen the advance sheets, to be "a superb volume." By the courtesy of the author we are enabled to give our readers a glimpse at a few scenes which the book will present, choosing for this page La Tourelle falls on the Columbia river, and in connection therewith we shall quote from an advance sheet the authors' comments upon these falls and the scenery leading thereto. "The Columbia river drains over 400,000 superficial square miles in its course. It rises in the Rocky mountains, in British America, just north of the United States line. It takes a due southerly course and holds this general course south, traversing the eastern half of Washington Territory until it reaches Oregon. It then turns directly westward, forming the boundary line between Washington Territory on the north and Oregon on the south. Near the point where it first touches Oregon, it connects with the Snake river from the east. The Snake, a large and navigable stream, rises far to the south in Idaho, comes north to a point a short distance north of the northern boundary of Oregon, and then turns east to join its waters with the Columbia in its grand march to the sea. A sail up the river is a continuous revelation of nature's most charming diversions of foliage, hill-creeping forests; loyal, verdant plains, stretching back on each side of you, and little heads and islands which lend the finishing enchantment to the whole.

"At the end of 125 miles, having passed the mouth of the Willamette river, you enter the region of the great cascades of the Columbia, and what is known as the 'Cascade Route.' This is a section which justly claims a place among the natural wonders and phenomena of the United States, and what is laid openly and boldly before you, on each side of the river, warrants this assertion. Being comparatively unexplored, little is known of this section but what is conspicuously laid open to the sight in the trip on the river; but the sturdy pioneer, in search of agricultural pursuits has, even at this present writing, found ample to award him, and settlements can now be seen in many cases, occupying the very brink of the river.

"The Cascade trip comprises a distance of 60 miles; and the upper portion—or the last five miles—is the portion where the waters of the mighty Columbia forces its way through the Cascade mountains. Roaring and surging, with immense walls and mountains, 3,500 ft. high, on either side, to assert that this is one of America's premium sights, and makes the traveler feel there is yet more in this country of ours than was ever dreamed of. Huge mountains from 1,000 to 3,500 ft. high fret the surrounding country to the very water's edge and ever find their way beneath this current in such promiscuous and ponderous masses as to throw the boats out of recognition of their courses.

"One of the first points of interest is that known as Cape Horn, a peculiar formation of concrete and sandstone rock rising perpendicularly from the water's edge to a height of 250 ft., and extending along the river for one-half a mile. The formation resembles large posts, pillars and cones cemented together to form some immense wall or barricade. The river boats, in their passage, run within stone's throw of it, and one gets his first sense of inspiration of the region he is now passing through. Following for a distance of eight miles is a region where the nymphs seem to have resorted; in their greatest ecstasy, to fulfill the delights of their wanton spirits. It would be hard to say how many water-falls there are in this limit. The La Tourelle fall is one of the grandest on the river, and to those who will stop at the La Tourelle Mountain House, and visit the fall, there will be at least one lasting reminiscence of a successful tourist. The falls are about 400 ft. high. Coming from an overhanging wall projecting from the land a distance of about 50 ft., the water is thrown in rain-how style, far out from the main land; and coming through mid air with great force, dashes itself to pieces in a basin carved from the rocks by its own power, and ornamented with wild flowers and vines in gorgeous profusion. Behind the falls there is a distance to the main land of about 80 ft. This is ample room for a drive-way between the fall and the back wall. You look out upon a broad open vacuum and up to a spotless azure sky; and between you and infinity there comes dashing down, in appearance, one colossal water column from heaven."

THE Tombstone Epitaph of Saturday says: "The first shipment of silver bullion from the Boston and Arizona reduction company's mill was made on the 28th, consisting of six bars—627 lbs.—valued at \$918,610. This bullion is the product of the experimental run, and the results are most satisfactory throughout. The Boston mill has another contract with the Vixina company for 1,000 tons of ore."

A BAR of mixed bullion recently taken to Nevada City was over half lead, washed out by the hydraulic mines at the old town of Mores Flat.

A Southern Coast Harbor.

Between 30 and 40 years ago, when the commercial interests of California were entirely confined to the shipment of hides, there were four harbors which were used by the hide droghers, and these were the only practicable places of any moment where vessels could load. They were San Francisco, Monterey, San Pedro and San Diego. Those who have read Dana's well known "Two Years Before the Mast" can recall the difficulties experienced in loading the hides, especially at San Pedro, or Wilmington, as it is now called, the sea port of Los Angeles. Both San Diego and San Francisco were natural harbors, secure in any wind; but at San Pedro the vessel had to anchor in an open roadstead, a mile or more from shore, and exposed in the winter to the furious southeasters and south-westerly winds which prevail in the winter months on this coast. The old *Pilgrim*, like many another vessel, had a narrow escape from laying her bones on Deadman's island, and they all had to have good ground tackle to ride out a blow in that roadstead. These same harbors are still the principal ones in California. Monterey is

an open roadstead. Cost of lighterage has been done away with, and, as has been stated, vessels now load grain there for foreign ports. This is a result which we are glad to note. The people of this section need not send their grain all the way to San Francisco first and then ship it to Europe. It goes to Europe direct now. We should be well pleased to see other shipping points along the coast where products could be shipped, but unfortunately California is rather barren of good harbors.

MINING COMPANY BALANCES.—The following companies had a balance on hand November 1st: Con. Virginia, \$15,570.59 in cash and \$79,849.91 (assay value) in unsold bullion; California, \$23,771.22 in cash and \$142,117.01 (assay value) in unsold bullion; Maxioan, cash, \$43,511.19; Opbir, \$2,284.92; Northern Belle, \$165,802.75 (October expenses unpaid); Standard Con., \$165,679.87 (October expenses unpaid); Sierra Nevada, cash, \$13,222.65; North Bonanza, \$11,356.47; Potosi, \$31,599.38; Con. Imperial, \$9,134.22; Chollar, \$10,085.04; Silver Hill, \$10,019.02; Challenge, \$6,530.69; Gould & Curry, \$32,809.96; Occidental, \$12,913.87; Alta, \$30,000; Bismarck, \$2,001.05; Flowery, \$322.44; Deliance, \$318.22; Navajo, \$172.54; North Belle Isle, \$8,316.72; Belle Isle, \$650.97; Independence, \$6,125.76; Argenta, \$990.88; Tioga,

LA TOURELLE FALLS ON THE COLUMBIA RIVER.

visited mainly by steamers, and while good enough in winter, is poor in summer. It is, however, practically a roadstead.

But the dangers and difficulties of the San Pedro anchorage are of the past, for this week we read that the British ship *Eskdale* sailed a day or so ago with 2,000 tons of wheat for Liverpool; and that the British brig *Orient*, which brought coal to Wilmington from England, has begun to load with wheat for Europe. Both discharged and loaded their cargoes inside the harbor at Wilmington.

This result has been entirely due to the government works at San Pedro, where nearly half a million dollars has been spent in building breakwaters to form the harbor. Before the artificial harbor was formed, all the vessels were loaded and discharged by means of lighters, and were, in the winter season, always in danger lying in the open roadstead.

A breakwater some 6,700 ft. long extends from Rattlesnake island to Deadman's island. This wall has been made partly of wood and partly of stone. On the inner side and parallel with it is another wall, intended to direct the current. Between these walls the shallow pontoons, reef and har have been dredged, so that our vessels can carry 15 to 20 ft. of water for about a mile from the entrance. Small vessels go all the way up. In spring tides 12 to 13 ft. of water may be carried all the way up to the wharves.

The improvement of this harbor was accomplished under the supervision of Col. Geo. H. Mendell, of the United States Corps of Engineers. The work was skillfully and economically carried out, and has accomplished more than was expected of it. As an engineering work, it has been an ensured success, and it has exercised a very marked influence on the commercial interests of the southern country. A good harbor has been made where before was

\$12,585.01; Summit, \$7,886.98; Bechtel, \$6,515.58; Booker, \$3,488.69; Double Standard, \$4,825.71; Bodie Con., \$11,552.98; Richer, \$446.25. The following companies had an overdraft at the bank or other indebtedness on November 1st: Union Con., \$15,242.25; Hale & Norcross, \$35,718.36; Lady Washington, \$10,557; Benton Con., \$15,818; Utah, \$4,161.35; Exchequer, \$18,720; Metallic, \$5,748.39; Best & Belcher, \$5,339.68; Equator, \$4,716.39; McClinion, \$277.63; Mono, \$487.73; Alpha, \$13,522.23; Bulwer Con., \$17,052.01; and Grand Prize, \$1,454.61.

IMPORTANT LAND DECISION.—On the 28th of October, the Acting Commissioner of the General Land Office rendered an important decision, in which he sustains the action of the Marysville (Cal.) Register and Receiver, in the matter of the application of Asa C. Ford, to enter under the law of June 15, 1880, the land embraced in his homestead entry of December, 1879, during the pendency of a contest of Thomas Gorham for cancellation of said entry, on the ground of abandonment. The Acting Commissioner, in rendering this decision, announces the following important construction of the two apparently conflicting laws for the relief of homestead settlers, which were enacted at the last session of Congress. He rules that when a person had commenced proceedings for cancellation of a homestead entry, in order to avail himself of the privileges and rights secured by Sec. 2 of the act of May 14, 1880, he has acquired such an adverse standing and interest as will prevent the contestee from making payment under the act of June 15, 1880, for the land embraced in the homestead; or, in other words, that the right of entry conferred by the last mentioned act is confined to cases wherein the United States and the applicant to purchase are the only parties interested.

New Dredging Machinery.

We have had a pretty good experience here in California with dredging machinery. Our tule land experiments have called for exceptionally good dredgers. We have left beaten tracks and experimented a good deal one way or another, not always with success; in fact, the proportion of failures has been great, and the old style of "bucket" and "clam shell" still hold their own, notwithstanding the many rivals which have come forward. In addition to those built for work around the tule lands, others have been constructed with special reference to mining work, and intended to bring up dirt and gold from river bottoms. All of these have been failures without exception.

The latest thing in the dredger line is a new steam dredger and levee builder, which is lying in the Channel St. waters, at the southern end of the city. It is said to have a greater dredging capacity than any machine of the kind ever before constructed. It was built by the Golden State Miners' Iron Works for General Thos. S. Williams, and is to be used to cut a canal through Grand Island, 12 miles long and 25 ft. deep, to carry off the surplus water of the Sacramento river. The earth raised will be thrown on the banks each side of the canal, and will form the levee. Seen at a distance, it looks like a grain elevator, and consists of a large scow, 100 ft. long by 80 ft. wide, upon which the massive machinery and lumber are placed. The dredging apparatus consists of a heavy ladder projecting over one end of the scow, around which revolves an endless chain, to which is attached 35 scoops that will hold 16 cubic ft., or about a ton of mud each. When worked to its utmost capacity, it will dredge 4,000 yards in 10 hours. The ladder will go down to a depth of 25 ft. and raise the mud to a height of 40 ft., from whence it is dumped into a large iron hopper. Attached to this hopper is a new invention for throwing the earth on the banks. It consists of an iron pipe 36 inches in diameter and 100 ft. long, attached to the hopper by a turn-table which permits the dredger to swing from side to side when at work, while the pipe remains stationary. The mud from the buckets is dumped into the hopper and, after a fall of 12 ft. is shot through the iron pipe at a rate of 1,500 ft. a minute, on the banks. The machinery is run by two 100-horse power engines, and the machinery, helting and running gear is on an immense scale. When at work a "spud" pile is let down through the scow and around which it swings as the ladder changes its position. When completed the dredge will have cost about \$40,000.

The Mining Laws.

We receive frequent applications for information concerning the requirements of the law as to work on mining claims—that is, the date when such work must be done. We have several times answered these questions, and now reproduce the amendments to the law passed in January last. We advise our mining friends to cut this out and place it where it can be seen for reference:

An act to amend sections 2324 and 2325 of the Revised Statutes of the United States concerning mineral lands.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that section 2325 of the Revised Statutes of the United States be amended by adding thereto the following words: "Provided, That where the claimant for a patent is not a resident of or within the land district wherein the vein, lode, ledge or deposit sought to be patented is located, the application for patent and the affidavits required to be made in this section by the claimant for such patent may be made by his, her or its authorized agent, where said agent is conversant with the facts sought to be established by said affidavits. And provided, That this section shall apply to all applications now pending for patents to mineral lands."

Sec. 2. That section 2324 of the Revised Statutes of the United States be amended by adding the following words: "Provided, That the period within which the work required to be done annually on all unpatented mineral claims shall commence on the 1st day of January succeeding the date of location of such claim, and this section shall apply to all claims located since the 10th day of May, A. D. 1872."

Approved Jan. 22, 1880.

C. H. SWAIN will soon institute suit against the Silver King mining company to recover \$300,000 damages for an alleged breach of contract. The Silver King folks made a contract with Mr. Swain whereby he purchased all their tailings. When it appeared that Mr. Swain was working the tailings at a big profit, it is stated that the Silver King management broke the contract. The suit promises to cause a big sensation in mining circles.

THE Bodie and Mono companies have purchased the Lady Washington pumping machinery, which will be removed from the mine of that company on the Comstock to the new joint Lent shaft of the Bodie and Mono at once.

EX-GOVERNOR H. G. BLASDEL has sold one-half of the Prospectus mine, Bodie, to Seth and Dan Cook. The latter have taken possession of the property.

New Way of Gravel Mining.

Just across Feather river, and almost opposite the town of Oroville, is the Oroville Mining and Irrigating Co.'s claims, one of the most valuable in the State. O. P. Powers, the principal owner, has the management of it. A few hundred yards below where he has worked for several years past, is a flat piece of ground that in summer is but little above the level of the river, and in winter, when the river is high, is entirely covered with water. The bluff near by is soon to be worked, which will cover the flat above referred to with tailings and other debris. But how to work the flat was the question with Mr. Powers. There was no fall, and of course no place to dump the tailings. He has been for the last month working in this way. He has made a flume and laid it on top of the ground, commencing at the river and running back, say 400 ft. The last piece of the flume is 48 ft. long and connected with the next box in such a way as will admit of its being raised or lowered, and stands at an angle of about 45°. A bead of water of 100 inches, with 200 ft. pressure, was being used. The nozzle of the pipe entered the head of the flume about one ft. The bead of the box was otherwise closed tightly, and covered on top about one ft. The balance was open, the same as any other flume box. Where this piece of the incline flume connected with the next box was covered on the top to prevent water, gravel and stones from going over, they would thump up against the top, fall down and be carried off.

This is the whole process. Shovel the earth into this open flume, set up at an angle of 45°, turn on the water and it will go up the flume like a shot out of a gun, bump up against the top after going through the first joint of flume, fall into the second box to be carried off the same as in any other flume. While watching the four men engaged shoveling the earth into the flume, Mr. Powers tumbled a 60 or 70 lb. rock in, which was carried up the incline with ease into the flume beyond. They have been at work only one month, and burrowed a large hole in the earth, into which Mr. Powers has placed a chief and turned on the water, loosening gravel by the carload, which flows into this slanting flume and is driven up into the level box. As they are near the river, and below its surface, from 75 to 100 inches of seepage water is constantly coming into the works, but does no damage; it soon runs into the slanting box, and it, too, is driven up the 48 ft. of incline into the almost level flume beyond.

We desire to state here that this slanting flume box, 48 ft. long, is lined on the bottom and sides, inside, with wooden blocks, the same as those usually found at the bottom of flumes, so that the space inside of this flume was one ft. wide, by something over two ft. in depth. It is a simple contrivance for mining level ground, where a bead of water for driving purposes can be obtained. Any man who ever made a flume box, can make one, and that, too, at a cost of less than \$100, including the blocks to line it. It is one of the simplest things on earth, and ought to have been found out years ago. It has been in operation over a month, and been examined by mine owners in this and adjoining counties, who pronounce it a complete success. No part of it wears out faster than the ordinary flume, except at the upper end where the rock and gravel bump against the covering, which wears out very fast. Should timber be used for covering instead of boards, it would last a longer time.—*Oroville Mercury.*

EXECUTING CRIMINALS BY ELECTRICITY.—The adoption of electricity as a mode of capital punishment has, says *Iron*, enthusiastic advocates in Germany, as well as in France, as witness the following imposing description of a method proposed by a German writer: "In a dark room, draped with black, and which is lighted only by a single torch—the chamber of execution—there shall stand an iron image of Justice with her scales and sword. Stern Justice is popularly supposed to have no bowels; but this German goddess will carry a powerful electric battery in her inside; and this battery will be connected with an arm-chair—the seat of death. In front of the chair shall stand the Judge's tribunal, and only the Judge, jury and other officers shall be present with the criminal during the ceremony of the execution. This will consist in the Judge reading the story of the crime committed by the prisoner, who will be rigidly manacled to the aforesaid arm-chair, and when this is done, the Judge will break his rod of office and toss it into one of the scale pans of Justice, at the same time extinguishing the solitary torch. The descent of the pan will complete the electric circuit and shock the victim into the next world."

RICH GOLD QUARTZ.—We mentioned last week, says the *Auburn Herald*, of Oct. 23d, that the Conrad mine was turning out rock that fairly glittered with gold. This week, we understand from those who have seen it, they are taking out gold that has a little quartz among it. It is said really that some of the pieces taken out are fully half gold. Another party tells us that no less than \$1,500 was taken out in two tubfuls last Monday.

INDIANS HAVE KILLED IN FOUR MONTHS 260 PERSONS in Grant county, New Mexico, so far as known. The people are holding public meetings to urge more active measures upon the Government and to denounce the course hitherto pursued.

A NEW BOOK.

A Treatise on the Horse and his Diseases.
By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year.

It is printed on fine paper and has nearly 100 pages, 7 1/2 inches. Price only 25 cents, or 5 for \$1, on receipt of which we will send by mail to any address.

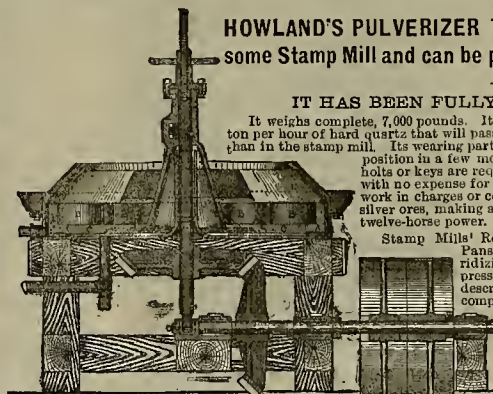

DEWEY & CO.,
202 Sansome St., S. F.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and grind in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Dills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supp. Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

GOLD SAVING

SILVER PLATED

Amalgamating Plates,

FOR QUARTZ MILLS AND GRAVEL CLAIMS.

ALSO, CHALLENGE SWINGING PLATES,

For use in sluices for saving FLOAT GOLD. Constantly on hand PLATES of all Sizes; are prepared to fill orders on short notice. Old Copper Plates Purchased. Replated or Gold extracted by our process, whereby we save the Copper and remove the Gold at a very small expense.

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from prominent Architects in this city.
Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review" we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huene, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newson, B. Henriksen

The Explorers' and Assayers' Companion,
By J. S. PHILLIPS, M. E.
(Third edition.) Price of Vol. 1, \$3.

**Scientific and Practical Books
on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by DEWEY &
CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arseniurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Millman, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or
der. It contains 120 diagrams, illustrating machinery
etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without
Quicksilver. 1880.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed full
of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country and in
Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces,
implements and working apparatus.

It is a work of great merit, by an author whose reputation
is unimpaired in his specialty.

Price, \$3.00, cloth, postage free.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Com-
parison; Manufacture, Care and Use of SAWS of all
kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph.D., M.E.,

Member of the Jury on Wood-working Machinery at Paris
Exposition of 1878.

This thorough work, impartially written in a clear, simple
and practical style, treats the Saw scientifically, analyzing
its action and work, and describing, under the leading classes
of Reciprocating and Continuous Acting Saws, the various
kinds of large and small hand, sash, maul, jig, drag, circular,
cylinder and hand Saws, as now and formerly used for
crosscutting, ripping, scroll-cutting, and all other sawing
operations in wood, stone and metal, etc. Ivory, etc., in this
country and abroad. With appendices concerning the details
of manufacture, setting, sawing, gumming, filing, etc., tables
of gauges, log measurements from 10 to 24 feet, and from 12
to 36 inches. Lists of all U. S. Patents on Saws from 1790 to
1880, and other valuable information. Elegantly printed on
extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and
illustrations since first projected, the price is this date made
\$2.50, postage paid.

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia

March 10 1880.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT
FOR DIAMOND POINTED DRILLS, now brought to the
highest state of perfection, are prepared to fill orders
for the IMPROVED PROSPECTING AND TUNNELING
DRILLS, with or without power, at short notice, and
at reduced prices. Abundant testimony furnished of
the great economy and successful working of numerous
machines in operation in the quartz and gravel mines
on this coast. Circulars forwarded, and full infor-
mation given upon application.

ket Street, corner of Fremont.

Well Tested Mining Devices.

ORATE BARS - Hydraulic. A saving of about half the
usual expense. GROOVED RIFLES - Hydraulic or quartz.
Will largely increase the yield of gold. Concentrators No.
1 and 2. Former without machinery. Latter for fine gold,
Sulphurets or Black Sand. BRYAN TYSON, Patented.
Manufactured by Rankin & Co., Pacific Iron Works.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.

FOR WEEK ENDING OCTOBER 23rd, 1880.

233,658.—GATE.—J. M. Cheney, Sonoma, Cal.
233,692.—WATER WHEEL.—L. A. Pelton, Camptonville, Cal.
233,698.—TAP AND FAUCET.—P. F. Gardner, Hills Ferry, Cal.
233,697.—COAL HOD.—W. S. Ray, S. F.
233,647.—STURRUP.—H. E. Woelke, San Jose, Cal.
233,740.—BURN AND FAUCET.—F. Engleken, Brooklyn, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WATER WHEEL.—L. A. Pelton, Camptonville, Yuba county, Cal. Patented Oct. 26, 1880. No. 233,692. This device relates to certain improvements in that class of water-wheels known as "hurdy gurdy" wheels, which are driven by the momentum of a stream of water delivered into buckets, on the periphery of the wheel, through a nozzle and under a high pressure. When the water is delivered upon flat or flat-bottomed buckets in this class of wheels, it splashes and reacts against the bottoms of the succeeding buckets, thus retarding the wheel. Buckets having pointed and other shaped bottoms, have been used to overcome the difficulty named, and with some success. In this invention a wheel is constructed having a flat face, and upon this face peculiar-shaped buckets are secured which are adapted to receive the stream from the nozzle and divide it so that the two parts of the stream are directed into the curved bottoms of the two halves of the bucket, and by means of the inclined or flaring sides the two streams are caused to react and escape smoothly at each side, so that the whole reactionary force of the water is utilized, and the water is discharged clear of the wheel and the following bucket.

COAL HOD.—W. M. S. Ray, No. 12 Market street, San Francisco, Patented Oct. 26, 1880. No. 233,697. In the shipping of light, bulky articles considerable cost for freight is entailed by reason of the space occupied, and coal-hods with their flaring bottoms and the projecting side-handle could not be economically packed. If they are shipped in the knock-down or incomplete form, they cannot be japanned or finished; would be spoiled in putting the hod together. This invention is intended to remedy this, and enable coal-hods to be packed or nested so that a dozen complete hods may be packed in a space not larger than would ordinarily be occupied by two hods, by forming the projecting parts separately, and providing means for uniting them without the aid of skilled labor after they arrived at their destination.

FARM GATE.—John M. Cheney, Sonoma, Cal. Patented, Oct. 26, 1880. No. 233,658. This invention relates to certain improvements in that class of farm gates which are constructed in such a manner that they may be opened and closed without the need of the driver of a team leaving his wagon to move the gate. The improvements consist in a peculiar combination of cords or chains and rollers applied to a gate, suspended on rollers and moving in a horizontal plane, said cords and rollers being adapted to be moved by crank from either side of the gate, whereby the gate is readily and smoothly opened and closed.

TAP AND FAUCET.—P. F. Gardner, Hill's Ferry, Stanislaus county, Cal. Patented Oct. 26, 1880. No. 233,668. The object of this invention is to provide a plug or tap which will stop the cask or vessel when drawn forward, and which may be moved back by the action of screwing the faucet in so as to open a communication between the interior of the cask and the faucet, while the said tap is at the same time guided in its movement and prevented, when forced in, from dropping into the cask and avoid the necessity of opening the cask, after the liquid has been withdrawn, to recover it.

The pending sale of the San Jacinto tin mine, San Bernardino county, Cal., has fallen through. The purchase price was to have been \$1,500,000. The purchasing company put up a forfeit of \$75,000 and sent an expert out to this coast, whose report was satisfactory, but the New York company failed, and their creditors have attached the \$75,000 which had been paid over.

At the Receiver's sale, recently, the Bullychoop and Occidental quartz mining property, Trinity county, was sold to James Johnson, of Indian creek, for the sum of \$5,200.

Diamonds in India.

In the "Journal of the Scientific Proceedings of the Royal Dublin Society," Mr. V. Ball, of the Geological Survey of India, gives an account of the mode of occurrence of diamonds in India and of their distribution, and adds references to the most important authorities on the subject. There are in India three extensive tracts, widely separated from one another, in which the diamond has been sought for. The most southern of these has long borne a familiar name, which is, however, to a certain extent a misnomer. There are no diamond mines in Golconda. This name, originally applied to a capital town, now represented by a deserted fort in the neighborhood of Hyderabad, seems to have been used for a whole kingdom; but the town itself was many miles distant from the nearest of the diamond mines, and it was only the mart where the precious stones were bought and sold. The second great tract occupies an immense area between the Mahanada and the Godavary rivers; and the third great tract is situated in Bundelkund, near the capital of which (Punna) some of the principal mines are to be found. The work of the Geological Survey has demonstrated that the diamonds occur in the Vindhyan rocks of northern India. In the upper division of this formation there is a group of clay slate (Kewah), and in the lower a group of sandstones (Semri), in both of which diamond-bearing beds are met with. It is still very doubtful, however, if a diamond has yet been found in India in its original matrix. Mr. Ball gives an account of the chief mines, describing in detail, from personal observations, that of Sambalpur, which has now for some time ceased to be productive. The Punna mines are still productive, yielding a mean annual produce of between \$40,000 and \$60,000 a year. Europeans have attempted diamond mining in each of these three tracts, but in no one instance have their operations been attended with success, and yet there does not appear to be the least ground for supposing that there has been any real exhaustion of the localities where mining is possible. In diamond mining there must necessarily be a considerable amount of individual handiwork. There are immense facilities for speculation. It would almost seem that to work it profitably a system of slavery must be adopted. It is, therefore, to be distinctly understood that, except by a mere chance, diamond mining will not prove a rapid road to fortune. Still, writes Mr. King, "for those content with a slow paying occupation and a hard life, involving close personal supervision of the workers, it would pay, provided such persons possessed capital sufficient to last them a few years."—*London Mining Journal*.

THE TRANS-SAHARA RAILWAY.—On his return to Marseilles recently, the chief of the Trans-Sahara railway expedition, Colonel Flatters, reported the practicability of a route about 200 kilometers south of El Golea, in 24° north latitude. The expedition found a reasonable amount of water, never having been three days without it, and in the course of the exploration a lake was discovered full of fish and surrounded by vegetation. The general character of the soil was a hard sandstone, though for 80 kilometers there was an arid belt of very hard limestone. The whole country is much infested with snakes and lizards, and among the wild animals are antelopes in great numbers. The tamarisk tree grows luxuriantly in the Sahara, acquiring a development of three and one-half yards in circumference. The price of salt is enormous, 100 kilos of this necessary article being valued at four slaves. As each slave is valued at 900 francs, the cost of two and one-quarter lbs. of salt is about 28 shillings. Col. Flatters met with great friendliness on the part of the Tovarais, and he entertains no doubt as to the feasibility of the project.

BUREAU OF ENGRAVING AND PRINTING.—During the last fiscal year the Bureau of Engraving and Printing delivered 7,143,241 sheets of notes and securities, of a face value of \$789,240,950; 15,252,306 sheets of Internal Revenue and Customs stamps, containing 330,822,266 stamps, and 765,251 sheets, and checks, drafts, etc., for the Treasurer of the United States and the disbursing officers of the several Departments, besides a large amount of miscellaneous work. The expenses of the Bureau for the year were: For salaries of officers on the pay roll, \$26,863; for labor and other expenses, \$383,171; total expenditures, \$910,034.

The San Francisco mint coined in October \$3,630,000. Of this \$1,580,000 was in twenty-dollar pieces; \$920,000 in ten-dollar pieces; \$530,000 in five-dollar pieces; and \$600,000 in standard dollars. During the last four months our mint has coined \$14,090,000, as against \$12,906,000 during the same time last year.

The Barbee & Walker Mining Co., of Utah, paid a dividend of 10c per share at New York last Monday, aggregating \$10,000. Milton S. Latham, formerly of this city, is President, and Richard L. Ogden, also formerly of this city, is resident manager.

At the Murchie mine, Nevada City, the new shaft, which has three compartments, is down over 400 ft., and is timbered as far down as 280 ft. The engine to be used for hoisting will be 180-horse power, and will hoist 1,000 ft. in one minute.

A Growing Vice.

During the month of October the police of this city made 2,103 arrests for various offenses. One might imagine we were somewhat of a lawless community judging from these figures; but on segregating the offenses it is seen that the greater majority are for what are known as minor offenses. Thus there were: for battery, 160; carrying concealed weapons, 23; disturbing the peace, 23; profane language, 110; misdemeanor, 142; vagrancy, 25; drunk, 1,071; common drunkards, 29.

It will be noticed that over half of the arrests were for drunkenness, a most deplorable feature, since this leads so frequently to grave offenses against the laws. There is hardly room to doubt that eight out of ten of the entire number of offenses owe their cause originally to the vice of drunkenness.

It is rather out of our province to write temperance lectures, even if we felt the inclination; but we cannot let the opportunity pass to call attention to the above figures which form in themselves a stronger temperance lecture than could be delivered. Out of a little over 2,000 arrests in this large city in a month over a thousand are for drunkenness. The respectable and sober citizens have to keep a force of men employed night and day to look out for a class who cannot take care of themselves. When over 1,000 men have to be arrested for drunkenness in any one month in our city, the spread of this insidious vice can be appreciated. The damage that these individuals may have caused during their drunken spree, it is impossible to calculate. The heartache, distress and destitution which has been brought upon their families must be imagined. It cannot be pictured or described.

AN AFRICAN "GRAPE" VINE.—The French are scouring the corners of the globe in the hope of bringing to light something in the form of a grape vine which will withstand the phylloxera. They have been growing wild American vines, wild Mexican vines—in fact wild vines from nearly every where in the hope that native wildness may be found some where with such vigor that the insects which lay low their fine cultivated grapes may be powerless against it. The latest report of a discovery of this character comes from the French explorer, M. Lacart, who is at present on the banks of the Niger, writes home from "Koundian (Ganganar), July 25th," that he has discovered a new vine which promises to be of great economical value. He says the fruit of the vine is excellent and abundant, its cultivation very easy, its roots tuberose and perennial, while its branches are annual. It can be cultivated as easily as the dahlia. He himself had been eating the large "grapes" of the vine for eight days, and found them excellent, and he suggests that its culture ought to be attempted in all vine-growing countries, as a possible remedy against the phylloxera. He is sending home seeds for experiment, both in France and Algeria, and will bring home specimens of the plant at all stages. This announcement comes direct from Paris, and must have some basis to it. Accepting it, therefore, until we know better, it must be acknowledged to be a flank movement on the phylloxera, for if we can grow grapes on what is not a grape vine there seems nothing left for the pest to do but to step out of the controversy.

THE QUEEN BUYS AN AMERICAN MACHINE.—Those readers who know how much English merchants and mechanics set store by the right to announce themselves as merchants or manufacturers "to Her Majesty," it becomes a matter of much interest to know that an American manufacturer has gained the right to place the Queen's arms over his door. We learn from Scotch papers that at a trial of self-binding reapers at Aberdeen, September 16th, the Queen was present, and was so well pleased with the working of Woods' string-binding reaper that she ordered one for her farm at Abergeldie, to be delivered for the harvest of 1881. The Aberdeen Free Press of September 17th, says: "In the course of the afternoon, and while the machine was at work, Her Majesty, accompanied by Princess Beatrice and attendants, arrived at the field. Her Majesty closely examined the binding of the sheaves, and graciously expressed her admiration of the work performed. In reply to Her Majesty it was explained that the machines had been at work in this country for five years, but that now twine had been substituted for wire in binding. The spectators, who had stood at a respectful distance during her Majesty's stay, lifted their hats as the Royal carriage drove off." It is not American to express much more elation at the favor of a sovereign than of any other well-disposed person, but the significance of the event lies in the position granted to an article of American design and manufacture, while there are several English machines contrived and claiming to do the same work. It is in fact a tribute to an American invention which is a credit to the progress of our industrial interests.

In the Ord district, Los Angeles, a 10-stamp mill is to be put up on the Stanway ledge. The ore runs \$20 per ton, and can be mined and milled for \$14.

News in Brief.

NAPA grapes are being shipped to Chicago. The Pondas of South Africa have rebelled. The steamers plying on Feather river have been doing an immense business the past three months.

The public debt was reduced over \$7,000,000 in October.

The miners at Columbiana, Ala., have struck for higher wages. There was a shock of earthquake on Sunday night in Newcastle, Ont.

During the month of October the police of this city made 2,103 arrests.

Five hundred of Sitting Bull's band have surrendered to General Miles.

Mount Vesuvius continues in active eruption, and streams of lava are flowing down the western sides.

A LIFE BOAT capsized recently in Harbor Wells, Norfolk county, England, and 11 of the crew were drowned.

The Princess Olga, youngest daughter of the King of Greece, died at Athens this week, after a few days' illness.

The Porte is sending troops and ammunition to the Greek frontier. Unless the Turks retire to a new frontier, war is certain.

The bark County of Richmond of New York foundered on Oct. 14th, off Brazil. Her Captain and most of her crew were drowned.

ULYSSES S. GRANT, second son of Gen. Grant, was married this week to Miss Fannie Chaffee, only child of ex-Senator Chaffee, of Colorado.

ONE HUNDRED AND EIGHTY-SIX British and foreign wrecks were reported last week. Of these, 161 vessels were lost on the British coast.

ANOTHER terrific hurricane, accompanied by a blinding storm, has passed over Denmark. The railways are blocked and a score of wrecks are reported.

SEVEN THOUSAND Montenegrins are preparing to collect at a camp near Antivari by Sunday night. An attack on Dulcigno is considered possible.

THREE car-loads of lumber were shipped from Sacramento market to Arizona last Friday—one to Tucson, one to Benson, and the other to Maricopa.

FIGHTING continues along the Russian lines in the Turkoman Steppes. Gen. Skobeloff proposes to declare a state of siege in the Trans-Caspian region.

THE Department of State is advised by our Ministers to Chile and Peru, that the conference between the Powers, under the good offices of the United States, closed without results.

SHEIK ABOALLAH has sent a communication to American missionaries in Kramiah requesting them to hoist the American flag above the Mission building, in order that it may be recognized and respected when the city is attacked by the Kurds.

On Sunday last, the Los Angeles train when within five miles of the city, broke a wheel and ditched seven cars, but fortunately injured nobody. The engine was not thrown from the track. The passengers were badly shaken, but escaped with only a fright.

THE mate and one of the crew of the bark County of Richmond, from New York, were taken from a raft, after six days' sail on it, near Leghorn, by an Australian bark. Their vessel foundered in a hurricane on Oct. 14th, and all the rest of the crew were drowned.

THE Peruvian Guano Co., of New York, have received this telegram from Chile, October 28th: "All the negotiations for peace between Chile and Peru were fruitless. Peru refuses to cede Tarapaca. Preparations are being hurried for a Chilean expedition against Lima."

A SAN ANTONIO telegram received from Gen. Grierson says that a band of about 30 Apaches, a remnant of the Victoria party, has crossed Rio Grande to Texas, and killed a corporal and two private soldiers. The Indians were pursued by Baldwin's company and driven back to the mountains of Mexico.

THE Chicago Tribune recapitulates the results of the great storm on the lakes on Oct. 16th. Over half a million dollars' worth of damage has been done to vessels and cargoes, and 92 persons have perished; 17 vessels were totally wrecked, and involving a loss of \$153,000, and 66 vessels were damaged.

GOVERNOR PERKINS has presented to the California Rifle Association a handsome gold medal to be shot for annually at the fall tournament of the Association, under such terms as may best promote skill in the use of the rifle and stimulate an interest in rifle practice. The trophy will be known as "Governor Perkins' Medal."

BALTIMORE papers estimate that nearly 80,000 people were brought into that city on October 12th, the day of the great celebration there. Of these the Baltimore & Ohio road is estimated to have brought 45,000, the Northern Central, 15,000, the Philadelphia, Wilmington & Baltimore, 10,000, and the Western Maryland 7,033. No accidents occurred in handling this great multitude, and the railroads must have made a handsome amount out of it.

PARNELL, speaking at the meeting in Limerick on Sunday, said that Parliament would not reduce rents, but when farmers had reduced them, Parliament would interfere and render the continuation of the agitation useless. It was necessary to adopt a platform which would profit laborers as well as farmers. They had got rid of the proprietors in France, Prussia and Belgium; why not in Ireland? He advised the people to offer a just rent to the proprietors, as then the question may be settled this winter.

HALL'S VEGETABLE SICIALIAN HAIR RENOWER is a scientific combination of some of the most powerful restorative agents in the vegetable kingdom. It restores gray hair to its original color. It makes the scalp white and clean. It cures dandruff and humors, and falling out of the hair. It furnishes the nutritive principle by which the hair is nourished and supported. It makes the hair moist, soft and glossy, and is unsurpassed as a hair dressing. It is the most economical preparation ever offered to the public, as its effects remain a long time, making only an occasional application necessary. It is recommended and used by eminent medical men, and officially endorsed by the State Assayer of Massachusetts. The popularity of Hall's Hair Renower has increased with the test of many years, both in this country and in foreign lands, and it is now known and used in all the civilized countries of the world.

FOR SALE BY ALL DEALERS.

The Californian.

THE RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. **AGENTS WANTED** in every town and village of the United States to canvass for this popular magazine. Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwice Boittho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

DEWEY & CO., American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

SECURE PATENTS

Through Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

The Clayton Air Compressor.

It has been the subject of frequent remarks by those most familiar with practical mining operations, that while great improvements have been made in the means employed for draining mines of surplus water, properly ventilating the workings, and for elevating the products of the mine to the surface, since the advent of the steam engine, that but little effort was made, and less accomplished in the way of lightening the labor of the miner, or rendering his efforts more effective, until the introduction of the power rock drill. True the miner's pick in form and general adaptability for its work was a marvel of lightness combined with strength, but its effectiveness depended solely upon the

the head, in a length of "one mile and 15 yards." Its escape into the surrounding atmosphere after performing its work in the "drills," "coal-cutting machines," engines or pumps, furnishes the supply of cool, pure air, which under any circumstance is a necessity. In considering the expenditure necessary to its introduction, it should not be forgotten that it eliminates from the mine's expense account the large amount which would be otherwise expended to secure ventilation.

Of late years air compressors have become a recognized necessity in mining operations, and all interested in this field of enterprise will be pleased to note the efforts made by manufacturers to improve their construction and increase their efficiency.

The accompanying illustration shows a Duplex Air Compressor, built at the Clayton Steam Pump Works, Brooklyn, N. Y. While it bears

first around the ends of the cylinder, one of which, at the completion of each half-stroke, is exposed to the greatest degree of heat developed by the compression of the air. The object of this arrangement is to correct any tendency to unequal expansion in different parts of the cylinder.

The induction and eduction valves are both placed in the cylinder covers, and are arranged so that the "valves" and "seatings" can be unscrewed and removed by simply taking off the cover. Discs of semi-elastic material are interposed between the valve faces and seats, which diminish the shock due to the quick seating of the valves, and protect the metal faces from wear, besides being quickly and cheaply replaced when worn.

Those who are familiar with indicator diagrams taken from air-compressor cylinders have noticed the "hump" on the cards, occasioned by

fill up the "clearance," has long been practiced by many builders. The improvement herewith shown consists in the manner of controlling and regulating the amount.

The general practice of allowing a small stream under pressure to flow in with the air and without automatic adjustment and control was open to serious objections. The revolving lubricating cock, seen in position between the two air-cylinders, and connected by belt with the main shaft, supplies a measured quantity of fluid to the cylinders at each stroke, maintaining a uniform supply per stroke regardless of the speed at which the compressor is run, and shutting off the supply when not in operation.

The suction-valves which open into the air-cylinders are supplied with "safety stems," which will prevent any accident from following the breakage of a valve from its stem, which has hitherto been one of the most fruitful

THE IMPROVED CLAYTON AIR COMPRESSOR.

strength and skill of the individual miner, while the hand drill and sledge were their sole reliance for removing rock, and the mule and boy monopolized the conveyance of the "output" of the mine to the foot of the shaft.

The power rock drill, as originally made, was designed to be operated by steam, and for quarrying and surface drilling the escape of the "exhaust" steam was no objection; but in the remote workings of the mine, its mingling with the already impure air was so objectionable, that it would have been a serious drawback to the general introduction of power drills, and in many cases would have led to their abandonment.

The success which attended the employment of compressed air at the Hoosac Mountain and Mt. Cenis tunnels as a means of conveying power through long distances, suggested its employment more generally in mining operations. Aside from the convenience with which it can be conveyed through crooked and difficult passages to the most remote points in the mine, and with so small a loss in transmission, that at the Hoosac tunnel the average loss of pressure from leakage, etc., was, on an average, but 2 lbs. after traversing 7,150 ft. of 8-inch pipe; and at the Mt. Cenis the loss sustained was but 3½ of

a close resemblance in many respects to the machines manufactured by this concern (illustrated and described at length in the PRESS of January 10, 1880) during the past six years, it possesses a number of new and distinctive features, and shows that Mr. Clayton has bestowed particular attention upon the construction of the air cylinder and its adjuncts. In this compressor a connecting rod is substituted for the sliding boxes formerly placed in the yokes, which are now allowed to remain sufficiently far apart for its admission, the yokes being rigidly connected on top by a brace rod, and at the bottom by a distance piece, which also serves as a slide, running an adjustable slipper guide (not shown in cut), which takes all the weight of the yokes, rods, pistons, etc., from off the cylinder bore.

This mode of construction allows the fly-wheel to be placed in the center of the machine and admits of the machine being braced from cylinder to cylinder, in such a manner as to secure great strength without an unreasonable weight of iron.

Instead of allowing the water to enter the jacket and follow its own course to the outlet, it is received at the center of the top of the air-cylinder, and the construction of the jacket is such that the cold water is compelled to travel

the excess of pressure (above that in the receiver) required in the cylinder acting upon the reduced area exposed to its pressure, as compared with the extent of surface upon which a counter pressure is exerted by the air in the receiver and delivery pipes. This excess of pressure frequently amounts to 30% and even 50%, and causes a loss of power as well as subjecting the whole machine to a succession of unnecessary shocks and jars. This difficulty is obviated in these machines by the use of a tripping device receiving a positive motion from an eccentric on the main shaft, and which admits of being adjusted to lift the valve at such a period in the stroke as corresponds to the air pressure maintained in the receiver.

Probably no one point in the construction of compressors has received more attention than means for reducing the "clearance space" to a minimum. In the air-cylinder any air remaining unexpelled at the completion of the stroke will re-expand to its original volume and pressure before any more is admitted through the proper valves, consequently the capacity of the compressor is reduced at each half-stroke by an amount represented by the volume of unexpelled air at its normal density. The introduction of some fluid, usually water, into the cylinder to

sources of accidents to air compressors.

The patent air governor (of which we understand Mr. Clayton is the sole licensee) is attached to these compressors. It can be set to any required pressure, which it will maintain without variation, it being immaterial whether steam is at 50 or 100 lbs. pressure, or the number of drills or other machines which may be working at one time.

To assist our readers in forming their own judgment of the value of the foregoing features, we give on page 316 of this issue a series of "indicator diagrams" taken from the air and steam-cylinders of these compressors, [which very clearly show the percentage of economy effected by their use.

By applying the indicator to the compressor-cylinder when the different parts are in position a card is given showing the results obtained through the use of the special appliances employed, and when these appliances are omitted, one by one, in subsequent diagrams, a comparison of results will show the relative value of each feature.

These cards are worked up by the same rules as are, followed in working up steam-engine cards. The resistance of the air to the advance

[CONTINUED ON PAGE 316.]

The Granite Basin Quartz Mines.

On Saturday last a *Plumas National* reporter made a trip to this portion of Plumas, and spent a day or two in looking over this district. He says: There are now about 40 men in the basin, several of whom have families, and who have gone there with the intention of making permanent homes. The mines are all quartz—not a washed gravel stone in the district. It was one of the first mining camps in the county, and the numerous ravines were worked out years ago, and yielded very rich returns for the slow and crude methods of mining in the early times. The gold was all of a character known as "quartz gold," and must have been washed into the gulches from the innumerable ledges which cross them in every direction. Most of the lodes now claimed are comparatively small, ranging from 12 inches to four or five ft. in width, and in most cases the country-rock is granite, occasionally one being found with porphyry on one side and granite on the other. Nearly all of them contain a large percentage of gold-bearing sulphurets, and there is no doubt but that these will prove the most valuable portion of the quartz as soon as the proper method or process for extracting the gold from them is brought into use. At present the gold in the sulphurets is lost. The rock is nearly all rich in free gold, ranging from \$5 to \$50 to the ton, with an occasional "spot" or "bunch" which would pay 10 times that. There has never been anything like a fair test of the rock, and although hundreds of tons have been crushed, it is plain to a practical quartz miner that the returns have not been one-half what they should have been, and the tailings now deposited in the beds of the streams will show a prospect equal to the best rock of many mines in other places.

One of the largest ledges in the district, called the Frenchman ledge, is now owned by the Franklin company, all of Susanville, Lassen county. The ledge is some three ft. in width, or that should be about an average, as it runs from two and a half to six ft. It was purchased by the present owners from a Frenchman named Lose, who had made it pay well by working the picked rock in an arastra, or pounding the very rich portions in a hand-mortar. The present company have had some of the rock crushed since they got possession, and although imperfectly worked it yielded at the rate of \$17 or \$18 per ton. The ledge is well developed to the depth of about 100 ft., is well cased up, and a clay seam is found on one side of it in every opening. A new tunnel has been started on the west side of the hill, and the grading for a new mill has been done. The mill machinery is expected every day from San Francisco, and will be put up as rapidly as possible. The cars will run from the tunnel directly into the mill, which will be a 10-stamper, run by steam. The rock is easily worked and but very few miners are required to keep a supply for a mill of that capacity. The new company certainly have very flattering prospects, and will probably be running 20 or 30 stamps before another winter after the coming one.

Swan & Ament own the first extension east on the Frenchman ledge, and have taken out considerable money from the little 9-stamp mill. The ledge in their claim has proved fully as good as in the other location, and some of the red sulphurets are wonderfully rich. They have a good property.

Close to the Frenchman is a smaller lode, owned by Jos. Peppin, and named the "Basin Beauty." No work has been done on it until lately, but it shows up rich in free gold, and at one of the openings a pile of rock is waiting for the crusher which will give big returns.

Over the hill, about three-quarters of a mile is situated the 8-stamp quartz mill owned by Rev. A. P. White. This mill has been at work on rock from different ledges, and Mr. White has not worked any rock from his own mine, the Granite, this summer. It is said to be a fine vein, and will make a good showing. Near this is located the "Jenny Lind," now idle, owned by Gov. Perkins, and the Sparks ledge, both counted good property by the miners in that section. An Eastern capitalist, named Parker, is now negotiating for the Sparks, Granite and some others, and if the sale should be made, work would commence on them on a grand scale.

A short distance down the ravine is located the "Irishman's Ledges," owned by Sullivan & O'Brien. On Tuesday they sold one of their claims to a gentleman named Christy, for \$4,800. This vein is small, but prospects and pays very richly, the rock being worked at present in White's mill. The wall rocks are soft and the quartz is easily mined. O'Brien & Sullivan still retain another ledge across the ravine, which is one of the finest prospects in the basin. A short tunnel has been run, and a small stope put up, showing the lode about three ft. wide going straight down. A run was made from this rock in an arastra, and from 20 tons the result was 18 ounces. The owners will run a tunnel into it this winter, and propose to put up a mill the first thing in the spring. They have a valuable mine, and deserve it, for they are hard workers and "mean business."

Across the creek, on the first extension of the same lode, Pres. Lyttaker has developed a splendid looking ore body, carrying fine sulphurets. He thinks he has got a small fortune, and it looks as though he was right.

Mr. Morgan Williams, of Susanville, is putting up a new 10-stamp mill to crush rock from his mines, the "Homestead" and "Mexican." He is said to have an abundance of gold quartz, and is sure of success.

See & Jolly are working a small vein a mile or

so from the Franklin. It is wonderfully rich, and they work considerably by "hand mortar process," getting \$15 or \$20 per day for their labor. They are storing their rock in the mill dump, and will crush it as soon as the winter storms set in. We intended to give them a call on Monday, but got off on one of the innumerable roads of that section, and missed the mine entirely.

Several other ledges have been discovered and located, and show well for the work done. The future of the basin is certainly very promising, and a flourishing mining town is sure to spring up there. There is an abundance of quartz, and rich quartz, too, and all that is needed to make it valuable is intelligent management.

The Green Mountain Mill.

The editor of the *Greenville (Plumas county) Bulletin* has been visiting the Green Mountain and Cherokee mines. Concerning the new mill of the Green Mountain Co., he says: In the construction of the mill there was used the following: 175,000 ft. of lumber, 40,000 shingles and 5 tons of iron bolts. The building is 50 ft. wide, 95 ft. long and 55 ft. high from the sill to the ridge, and is surmounted with a fine large cupola, from which is obtained a magnificent view of the valley beneath. As the building is built in the bank, excavations had to be made and a place graded 80x100 ft., leaving a bank in the rear of the building 30 ft. high. The rock room has a capacity of 1,500 tons.

In the mill there are 175,000 lbs. of machinery, which are propelled by a Knight burdy wheel, 6 ft. in diameter, for which there is a supply of 150 inches of water, with 420 ft. pressure, giving 144-horse power. There are 12 mortars of 5 stamps each, making 60 stamps in all, and each mortar weighs 5,000 lbs. These are fitted with patent self-feeders, requiring but two men to attend to all the stamps, and so convenient is the mill that 6 men on each shift are all the force required while it is running.

The cam shaft is 5 inches in diameter, and the main driving pulley on the wheel shaft is 3 ft. from which, by an immense 5-ply rubber belt 36 inches wide, power is transmitted to a 12-ft. pulley on the counter shaft, weighing 5,000 lbs. From this there are 4 48-inch pulleys belted to 7-ft. pulleys on the cam shaft, so that each 15 stamps can be run independently of the others.

The dump has a capacity of 1,000 tons, and is connected with the mill by a tramway 1,025 ft. in length, having 2 tracks on which cars are run, holding 1½ tons each, the loaded car down pulling up the empty one, a drum and brake regulating the speed. The cars can make 10 trips per hour, carrying 15 tons, or 150 tons in 10 hours, which will keep the stamps at work for the 24 hours.

To cover the numerous area of battery aprons 1,750 lbs. of silvered copper plate are used. The frame of the building is composed of massive timbers, generally 12 to 16 inches square, of which 10,000 ft. were used, smoothly hewed. The frames of battery and shafting are planed and nicely painted. Substantial stairways lead to all the upper portions of the building, every part of which is easily accessible. The company intend to have a complete system of fire hose and water pipes throughout the building, connected with the pressure from the main pipe, so that the entire mill could almost instantly be flooded in case of fire. The supply of water comes from Round Valley reservoir, which is owned by them and covers 700 acres, and reaches the mill through 7 miles of ditch and flume.

EUREKA COAL COMPANY.—The Eureka Coal Co. are still pegging away with their tunnels and shafts, headed toward the center and base of Bald mountain. They have been rewarded for upwards of 18 months' work in that they have found coal of a first-class character, but the stoping and freighting have been considered too expensive a feature to offset the work necessary. Yesterday fresh supplies and hands were sent out and the prospecting will be continued at least two or three months longer. The coal found in this company's ground is of the class for which our blacksmiths pay enormous sums, to use in welding, and if the next four months' work does not develop a large vein of coal, the body now in sight will be stowed out to help defray the expenses of the company. That coal of an "A No. 1" quality exists in close proximity to Eureka has long ago been demonstrated, and the quantity is the only matter of question now, and it is the point which the above company propose to solve before spring. —*Eureka Sentinel*.

BAD NEWS FROM MAMMOTH.—We learn that about everybody is leaving Mammoth City. More than half the business houses are already closed up, and great depression prevails. The principal hope of the camp centered on the Headlight and Monte Christo tunnel, but it is now long past the point where it should have tapped the ledge. We regret this bad outlook for that Mono county camp quite as much as if it was within our county lines; it is bad for Inyo interests every way. A large portion of the late residents of Mammoth, however, are coming in this direction to seek their fortunes, and some good may eventually come to us in that way. —*Inyo Independent*.

New pumping machinery has been purchased for the Lent shaft, now being sunk jointly by the Bodie and Mono Cos., at Bodie, and will be erected at once.

Eureka Mining District.

Hitherto the channels by which the capital of English investors has found its way for the promotion of mining enterprise in the far West have lain chiefly in the direction of California. Large sums have been spent in the development of the famous mines existing there. The profits resulting from the employment of capital in that mining country have been enormous. The operations carried on have been useful as demonstrating the vast mineral resources of the New World. It must not be forgotten, however, that other mining districts beside the above afford a lucrative opening for English capital now lying idle. The success and well-merited reputation of such companies as the Richmond and Eureka Con. point out a new field in which skilled enterprise will meet its reward. Eureka county, Nevada, as proved by the operations of these and kindred associations, is developing a richness which will probably place it in the first rank among American mining centers. Constant reports come to hand of the active opening up of the district of Eureka.

New mines are continually being started, and in most cases with very encouraging results. The success of local miners will undoubtedly attract investors here, and no reason exists why capital on this side of the water should not participate in the profits which are at present being realized in Eureka district. Among the numerous paragraphs in the local newspapers relative to current mining operations we quote for the information of our readers the following from the *Sentinel*: In regard to the Ruby and Dunderberg it is stated that "The Ruby and Dunderberg have their working shaft down a depth of 600 ft., and before stoping will sink 100 ft. more. The prospects of the mine are very flattering.

In regard to the Williamsburg it is remarked, by the *Ruby Hill Mining News*, that "there is a general feeling among miners on the mountain that the Williamsburg is destined to prove one of the big mines of the district. There is no diminution of the ore output, and it is thought that when more thoroughly prospected it will prove a veritable bonanza."

The Albion mines, near neighbors of the Richmond have discovered a most valuable ore body, which is spoken of as one of the most important ever made in this district. One of the favorable features of Eureka district mining is not so much the high grade ores as the marvelous supplies which in each well-managed mine are brought to light. There is not a single instance where a fairly opened mine has not richly repaid the fortunate adventurers engaged therein by the vast paying ore bodies laid open. Capital is alone required, combined with energetic and able management, to make the Eureka district one of the most favorite fields of mining enterprise. —*Eureka Sentinel*.

THE UNION PACIFIC RAILWAY.—This road, originally built simply to form part of a trunk line from the Missouri river to the Pacific, is rapidly developing means of support other than from its trans-continental business, which we understand now forms only about 24% of its receipts. It has already several branches in Nebraska, aggregating nearly 250 miles, is building about 150 miles from near Julesburg to Evans, on the Denver Pacific, saving about 60 miles to Denver, is about to build a line northward to the Black Hills, and its Utah & Northern branch has already been pushed northward from Ogden 350 miles into a mining and grazing region of great wealth, while a branch from this line westward to the Columbia river at about Walla Walla, whence the Oregon Navigation company's road will give a route to the Pacific coast, is projected and will doubtless be built. Meantime a vast region of Nebraska and the western Territories remains to be made tributary to its main line as may be found advisable. —*Railway Age*.

THE MINING OUTLOOK IN ESMERALDA.—For some time there has been an undercurrent at work in San Francisco and this place in regard to our mines, and within the last few days it has come to the surface that the Cook Bros., the wealthiest and most influential mine operators on the Pacific coast, have got control of the Prospectus mine, formerly owned by Gov. H. G. Blasdel, and were going to work in a business-like way to develop the property. For some time past San Francisco and New York capitalists have been looking into the merits of our mines. Now we have it for a certainty that two men, whose judgments in mining matters have been very correct, have decided to open up one of our most promising mines. Other companies are making inquiries into the merits of the camp, and we may reasonably expect before very long to see work started in earnest upon several other mines here. —*Herald*.

A PROFITABLE SPECULATION.—The Little New York & Manhattan Beach road of three ft. gauge, running from Greenpoint, N. Y., to Manhattan beach, 15 miles, with a branch from Bay Ridge eight miles, carried, says the *Railway Age*, during the season of four months from May 27th to September 25th, no less than 2,003,000 passengers, and that too, without injuring one. We are not informed of the gross receipts, but they must have been very large, even at the rate of fifty cents including steam fare, for the round trip from New York. The operating expenses were only 40% of the earnings. The road has done its work for the year, and its rolling stock has been laid up under cover, until summer again calls the multitudes to the sea coast.

Cory Mining District.

From a correspondent of the *Bodie Standard-News*.

Its Situation.

Cory is situated on the Mount Grant range of mountains eight miles south of Walker lake, and eight miles from Hawthorne, the termini of the Nevada & Colorado railroad. This district was discovered in September, 1878, by Eugene Gallagher, an old prospector of large experience, who located, and to some extent, worked the big Indian mine that is proving to be one of the most valuable mining properties in Nevada.

The Big Indian Mine

Is worked by a tunnel run on the vein a distance of 300 ft., showing in the whole course of the tunnel a strong and well defined vein of ore that will mill \$75 to the ton. There is no waste in the vein. The foot wall is hard and strong, with a slight pitch south, the vein running a little north of west, and south of east. We are now stoping and upraising on the vein, and have about 100 tons of ore that have been selected for the purpose of shipment to the Pine Grove mill, a distance of 40 miles.

The Golden Eagle Mine

Was discovered and located about one year since by Mr. Crossford, Buckingham and others. They are now sinking an incline shaft on the vein that is down on the ledge 90 ft. The ledge at the bottom is two ft. wide—all good ore that will pay to mill. They have now on three ore dumps over 80 tons of ore that, without sorting, will mill \$75 per ton. No drifting has been done on the ledge. The shaft will be continued down to a depth of 150 ft., at which point a station will be cut, drifts run on the ledge and the mine at this point thoroughly opened up.

Other Locations.

A number of other locations have been made by C. F. McKinney and others of Bodie, amongst which are J. Sparrow, John Gildea, Frank Doyle and P. Donahue. The latter gentleman is one of the original locators of the South Bulwer mine in Bodie district, and has charge of and working the mines here. These mines show well as far as worked. The ledges crop out boldly at the surface, have good, strong walls carrying a fine quality of ore, some of which is very rich and showing free gold in abundance. Every indication stamps them as true fissure veins.

Wood and Water.

There is an ample supply of wood and water for milling and mining purposes throughout the district, the mountains being densely covered with large mountain mahogany timber. Large springs of splendid water are to be found in every canyon, forming creeks of considerable size that can be carried to any point in close proximity to mines or mills. Roads can be built at light expense to the railroad center, and to all other points. Though unknown to-day, this camp will soon become a hollion producer and attract the attention of the mining world.

RARE ELEPHANTS.—There are now on exhibition in this city (New York) two peculiar elephants brought from the mountains of the Malay peninsula, about 800 miles from Singapore. They are remarkable for their small size, being respectively 28 and 36 inches tall; and for being covered with a thick coat of bristly hair or wool. They are supposed to be from five to seven years old. In size they resemble the extinct elephants of Malta, and in covering, those of Siberia. Their woolly coat is attributed to the circumstance that they live high upon the mountains where the climate is cold. The species appears to be all but unknown to naturalists, this pair being the first that have survived the passage through the heated low country to the coast and the subsequent journey by sea. The sailors on the steamer which brought them—the *Oxfordshire*, Capt. C. P. Jones—named them Prince and Sidney. They are described as playful and harmless, and they keep their little trunks stretched out to strangers to be petted. They love to be scratched on the under side of the trunk close to the mouth, and they hold their trunks curled back over their heads as long as anyone scratches them. Like elephants of larger growth, they keep up a swaying motion, either sidewise or forward and backward. When a visitor takes one of the little fellows take his hand he delicately curls his proboscis around it and carries it gently to his mouth. Then he trumpets his satisfaction. —*Scientific American*.

INTERESTING PHENOMENA.—A remarkable instance of lightning ascending vertically is reported to the French Academy of Sciences as having occurred last month at Paris. M. Trecul relates that during a violent storm just at nightfall of the 19th Sept. he saw flashes rising vertically, and apparently starting from the tips of lightning rods, though he is not sure that they started from them. The flashes went out in a kind of a luminous ball, diminishing in the intensity of the light from the center toward the circumference. One of the smallest of these had an oval shape of from 8 to 10 inches in width, terminating the column of fire. On two occasions two of these luminous columns, having risen a distance apart about equal to the space between two lightning rods, suddenly darted toward each other at right angles to their vertical course and went out on uniting, making no flash and no noise.

MECHANICAL PROGRESS.

American Iron and Wood for Ship Building.

It is said on high authority, that American ship building iron is superior in tensile strength to British iron; hence the increasing use of steel by English ship builders. British iron generally averages about 40,000 lbs. tensile strength to the inch, while the steel used for the same purpose has a strength of 65,000 lbs., and is only about $\frac{1}{4}$ cents a lb. dearer. According to the *London Times*, the Lloyd's rule allows a reduction of 20% in weight from iron when steel is used, which will give a saving in weight of hulls, as far as steel is used, of 150 tons out of every 1,000, which saving may be added to the carrying capacity of the vessel. The English Admiralty has taken the subject up, and invited manufacturers to supply steel plates under the condition that they should not exceed 30 tons, nor fall short of 26 tons per inch in tensile strain, while at the same time proving their ductility by certain bending and punching tests which are prescribed.

The Lloyd's are also advising the use of steel, and have laid down special rules for its use, raising the limits of tensile strength above those of the Admiralty by one ton.

The English steel manufacturers are making efforts to conform to these requirements, and ships of the largest class, steamers and sailers, are now being constructed of steel both for the navy and mercantile marine. The *New York Commercial Bulletin* suggests in this connection, that while our ship owners are considering their present inability to compete with foreigners, it will be very proper for them to take into consideration this new element, as it is quite likely that steel may economize transportation by sea, as it has on rails by land.

In this connection we call attention to the following paragraph, which we clip from an American journal called "*The Ship*:"—"American timber, as tested by Prof. Thurston, gives figures in tension from $\frac{1}{4}$ to $\frac{1}{2}$ higher than the European woods, with the exception of ash; the strength of American timber, as given by earliest authorities, is probably that of average specimens, and timber may be obtained, as in this case, by careful inspection, of a very much greater value, and it is quite safe to state that American timber has in construction a value equal, if not decidedly superior to European timber. Prof. Thurston concludes, from extended studies of the subject, that the strength of timber is so variable, that the only safe course in construction is to assume the highest value determined by the most uniform series of tests of the material proposed to be used, and then to adopt a high factor of safety."

Improvement in Locomotives.

There has been, during the last few months, a considerable awakening in the matter of improvements in locomotive construction. We have already made notice of several improvements made and in contemplation, and we now learn that what is considered an important invention in this direction has just been successfully tested on the Delaware and Lackawanna railroad. We find the following report of the trial in the *American Manufacturer*: "A special train, bearing prominent mechanics and capitalists, and drawn by the locomotive named 'Counterpressure,' left Utica at 10 A. M. Oct. 22d, and proceeded to Waterville, 21 miles distant. Here a train of six heavily loaded coal cars was attached, and without the application of a single brake, was taken to Utica. The speed of the train was diminished and stops made on down grades of 70, 80 and 90 ft. per mile, by the use of a lever, the engineer being able thus, unassisted, to slacken the speed of the train at will. The locomotive used is of the ordinary pattern. The power brought to bear against the piston is obtained and controlled by the use of an extra valve in the steam chest. By this steam is had direct from the boiler through a pipe which enters the steam where ordinarily the oil cups are placed. By this arrangement there is no need to reverse the shut-off lever, thereby obviating an immense strain upon the engine which attends the process known to railroad men as 'hauling over.'"

WIRE ROPE TRANSMISSION.—Among the recent improvements in the way of transmitting power for long distances, is the substitution of belts by endless wire ropes running at a high speed. Just where the belt becomes too long for economy there the rope steps in. In place of a flat-faced pulley a narrow sheave, with a deep, flaring groove, is used, the groove being filled out, or lined rather with leather, oakum, India rubber, or some other soft substance, to save the rope. The essential points are a large sheave, running at a considerable velocity, and a light rope. When the distance exceeds 400 ft., a double-grooved wheel is used, and a second endless rope transmits the power 400 ft. further, and so on. The loss by friction is said to be only 8% per mile. If it is required to transmit 300 horse power by means of a wire rope, the size of rope required will be one inch in diameter, running 4,920 ft. per minute over a wheel $14\frac{1}{2}$ ft. in diameter, making 108 revolutions per minute. One is thus enabled, at a small expense, to transmit power in any direction.

How a Ship is Built.

The *modus operandi* of laying out the work for building a ship, or rather for shaping the ship, forms the subject of an article in *Harper's Magazine*. The length, breadth and depth of the vessel having been decided upon, the next step is to make the model, which is done as follows:

A cabinet maker carefully prepares a number of pieces of choice wood of exactly equal thickness—say from four to six inches wide, and from a yard to one and a half yard long. At the same time he selects an equal number of pieces of veneer of the same size, choosing a veneer of a dark color, or color contrasting with the other wood. The boards are carefully laid one over the other, with the veneer between each, and the whole is then glued together to make a solid block. Out of this block the designer shapes a model of one-half of the hull of the ship. He gives the block the exact shape the future ship to assume when seen from the side. Only a half model is made, as the two sides of the ship will be simply duplicates of the model.

The marine architect must combine science with beauty or form, of rather his science must be expressed in a beautiful form. The model must be an exact copy of the ship in little. He must be able to point out how deep the ship will sink in the water; how the bows will part the water in front; how the displaced water may sweep past the sides and under the stern. The model must show how deep the screw will be submerged; how far the ship may heel over under the influence of her sails or the waves in safety; and how she will be upborne from moment to moment on the ever-shifting waves. His art is the careful adjustment of force one against the other, the weight against the flotation or buoyancy, the resistance of the water against the power of her screw and engines, the force of the waves and wind against her own stability. The finished model is full of grace and beauty; but it comes not from the mere blending of sweeping curves and swelling lines, but from the balance of these forces. It is beautiful because the repose of force in equilibrium is always beautiful. Certainly, if the architect is called an artist, the model maker is fully his equal.

A NOVEL RAILWAY DEVICE.—M. Haureg, a French inventor, proposes a method of hoarding railway cars without stopping the train. A "waiting carriage," fitted with a steam engine with special gear, and space for passengers and luggage, is placed on a siding at the station, and picked up by the train as it goes past. The latter, by means of a hook on its last carriage, catches a ring supported on a post, and connected with a cable wound on a drum in the waiting carriage. Thereupon the drum begins to unwind, and in doing so compresses a system of springs, while the carriage is moved at a rate gradually increasing to that of the train. The engine of the carriage then winds in the cable, the train and carriage are connected, passengers are transferred from the joined carriage to the train, and *vice versa*; then the two are disconnected, and the engine of the carriage, working on the wheels, brings it back to the station whence it was taken.

HIGH-SPEED MACHINERY.—The speed of a cutting machine should be regulated by the number of feet per minute traveled over by the cutting face and the quality of the material cut. From 15 to 18 ft. per minute may be allowed for wrought or cast iron, and twice that speed for gun metal, whilst for steel the speed must be reduced in proportion to its hardness. As a rule, these speeds are seldom approximated to, and it thus becomes a matter of serious loss to the engineering manufacturer that a certain coat of plant is not producing its full equivalent of work in a given time. In the same way, with reference to the prime movers or engines, their development of power is exactly proportionate to their speed; indicated horse power being the product of the gross pressure multiplied into the number of feet per minute, through which the resistance is overcome. About 300 ft. piston speed per minute is the average speed for which most commercial engines are designed.

A METALLIC THERMOMETER.—M. Corot, a Frenchman, has brought out a novel thermometer, which is chiefly remarkable for the small space which it occupies, and which renders it particularly suitable for those who need pocket instruments which are not subject to accidental breakage. M. Corot's end to end several concentric tubes of different metals, steel and zinc, for example. By alternating the joints the difference of dilatation are added, so that the last tube, being connected with a toothed wheel or series of levers, gives a great motion to a needle, sufficient to indicate small fractions of a degree of temperature. The metals being good conductors, the indications are rapid when the metallic mass is placed in contact with any body of which the temperature is desired. The tubes can be concentrated in a space of less than an inch.

STEEL FOR BOILER PLATES.—The tensile strength of steel for boiler plates should not greatly exceed 60,000 lbs. per square inch; above 70,000 lbs. the plates are apt to be brittle; below 50,000 lbs. they are likely to be spongy. No plate should be used which, after heating to a cherry red and plunging into cold water, will not allow bending over cold until the sides touch, and without breaking.

SCIENTIFIC PROGRESS.

The Recent Comet.

The spectrum of this comet, known in Europe as Hartwig's comet, from its discoverer, was examined with a spectroscope, at the Royal Observatory, Greenwich, on the evening of Oct. 7th, and was found to consist of three bright bands and a continuous spectrum corresponding to the nucleus. The position of only one of these bands—the middle and brightest—could be ascertained, and that in no very satisfactory manner. The positions of the other bands were not measured at all, owing to the unfavorable nature of the weather, the comet being low and involved in haze and cloud.

The opinion is expressed by Prof. Wincke, of Strassburg, that this comet is identical with one seen Sept. 29th, 1506, and its position roughly described by European observers of that date. Mention is also made of the same comet in Chinese annals of that date. The Professor also remarks that early Chinese observations have been found of much assistance in enabling astronomers of the present century to approximate the orbits of comets. Two appearances, one in 568 and another in 1337, are particularly referred to, in addition to the present one. The Chinese have the record of a very remarkable comet that appeared A. D. 178, which, from the long track it described in the heavens, must have passed very near the earth.

The following paragraph may be interesting as showing the manner in which such observations were placed on record in those early days. The comet described is supposed to have been the one to which attention is now being directed: "As regards European observations of the comet of 1506, Pingre tells us (on the authority of the *Chronicles* which, according to his excellent custom, are named in his margins) that a comet was seen in the month of August in the north, or between the north and east, or lastly between the west and north, and as the comet was not distant from the pole, so that it appeared in the evening after sunset, and in the morning before sunrise, it may have had at different hours of the night the various positions mentioned by the historians. It had a long and bright tail which extended 'between the fore end and hind wheels of the chariot.' On August 8th, a Polish historian, an eye-witness, says it was seen near the pole above 'the seven stars or the stars of the great chariot'; on the following night it was situated amongst the same stars, and later, on several nights, it was seen below them; declining by the sign Cancer, Leo and Virgo, it attained the northern part of the horizon and disappeared on August 14th. Some writers limit its appearance to eight days; others say it was visible for three weeks, or even a month."

The same comet was described in the Chinese annals, and translated by Biot and Williams, as follows: "We read that in the first year of the epoch Ching Tih, in the region of Woo Tsung, on the day Ke Chow of the seventh moon (1506, July 31st), a star was seen to the west without the boundary of Tsze Wei (the circle of perpetual apparition). After some days it had a short tail. It was seen between the sidereal divisions Tsan (determined by *della*, Orionis) and Teing (by *mu*, Geminorum); (the Chinese sidereal divisions, it must be remembered, being intervals of right ascension with wide limits of declination reckoned from the determining star of the division.) It gradually lengthened, extending in a northwesterly direction towards or to Wan Chang (*della*, *upsilon*, *phi*, *Ursæ* Majoris). On August 10th it was bright, and moved to the southeast, it lengthened to about 5° and swept the upper of the stars Hea Tae (*mu*, *xi*, *Ursæ* Majoris), and entered within the space Tae Wei Yuen (Biot's *Thai-Wei*); (a space between stars in Leo and Virgo, to which, as also to Tsze Wei, the circle of perpetual apparition mentioned above, constant reference is made in the Chinese cometary observations.)"

INFLUENCE OF VENUS ON THE EARTH.—Mr. R. G. Jenkins, F. R. A. S., has endeavored to show a very remarkable effect of the planet Venus upon the earth. The present British Astronomer Royal proved, many years ago, that the disturbing effect of this planet was so great that the earth was materially pulled from its orbit. Mr. Jenkins shows that it is to this action that we must look for an explanation of the cold waves, which occur on an average every eight years—as in 1829, 1837, 1845, 1855, 1863, 1871, 1879—and that for the next 40 years the temperature will be below the average. He states that a heat wave has been observed to pass over the earth every 12 years, nearly contemporary with the arrival of the planet Jupiter at its perihelion, such a wave being now close at hand.

MAGNIFYING GLASSES 2,500 YEARS OLD.—In the writings of Confucius, the great Chinese philosopher, the following passage occurs: "As we use a glass to examine the forms of things, so must we study antiquity, in order to understand the present." This sentence points most unmistakably to the use of magnifying glasses long before the time of the writer, who died 478 years before our Era.

Liquefaction of Ozone.

At a recent meeting of the French Academy, M.M. Hautefeuille and Chappuis announced that they had liquefied ozone. These chemists have been able to ozonize oxygen to a greater extent than has hitherto been done, by passing the silent discharge through the oxygen at a low temperature. The tube containing oxygen was immersed in liquid methylic chloride, which boiled at -23°. After being submitted to the electric discharge for 15 minutes at this temperature, the oxygen was conducted into the capillary tube of a Cailletet's apparatus, the temperature of which was maintained at -23°.

After a few strokes of the pump the gas in the tube appeared azure blue; as pressure increased, the depth of color likewise increased, until under a pressure of several atmospheres the ozonized oxygen appeared dark indigo blue. The pressure was increased to 95 atmospheres, and was then suddenly removed, whereupon a mist, indicating liquefaction, appeared in the capillary tube.

The stability of a mixture of oxygen and ozone rich in ozone appears to be chiefly dependent on the temperature. If such a mixture be rapidly compressed at ordinary temperatures, a considerable amount of heat is evolved and the gas explodes.

Ozone, say M.M. Hautefeuille and Chappuis, is therefore to be placed in the category of explosive gases.

Berthelot has shown that the transformation of oxygen into ozone is attended with absorption of heat; the stability of products of endothermic reactions is, as a rule, increased by decreasing temperature.

Ozone is much more easily liquefied than oxygen; the latter must be compressed under 300 atmospheres at about the temperature of -29° before sudden removal of pressure succeeds in producing liquefaction.

We have thus the existence through a large range of temperature and pressure of two allotropic forms of the same element; each with distinctly marked chemical and physical properties. We know that the molecule of oxygen has a simpler structure than that of ozone; the substance of simpler molecular structure is capable of existing through a much more extended range of temperature and pressure than that of more complex structure. Under special physical conditions it seems possible that new allotropic modifications of various elements might be produced.

The marked differences in color and in temperature of liquefaction, between oxygen and ozone, furnish another illustration of the close connection which exists between the "chemical structure" and physical properties of substances; a different "linking," even of similar atoms, being evidently associated with distinctly different physical properties.

M.M. Hautefeuille and Chappuis will doubtless soon be able to furnish more details of the properties of this most interesting substance, liquid ozone.—*Nature*.

ARTIFICIAL CITRIC ACID.—Another brilliant synthesis has recently been accomplished in the domain of organic chemistry; Messrs. Grimaux and Adam have succeeded in building up citric acid from glycerine. Curiously enough, in the last number of the *Berlin Berichte*, Kekule announces that he has been working at the same subject, but by a totally different method. Kekule's work is not sufficiently advanced for him to say positively that his method of synthesis is successful, but he feels justified in saying that very probably the process adopted by him has resulted in the formation of citric acid. *Nature*, from which we clip the above, promises full details of this interesting work in its next issue.

A NOVEL OBSERVATORY.—Prof. Watson, of the Washburn Observatory, in the grounds of the Wisconsin State University at Madison, Wis., is building an observatory of a novel kind. It is generally known that from the bottom of a deep well the stars can be very plainly seen at bright noonday. Upon this principle Prof. Watson is conducting his experiment. A cellar 20 ft. in depth has been sunk below the surface of the ground at the bottom of the slope; over this a fine stone building is erected. At the top of the hill, which is 60 ft. above the bottom of the cellar, powerful reflectors are to be placed, to throw rays of light down a large tube which ends in the cellar, where the observer will be stationed.

THE UTILIZATION OF SAW-DUST.—The sawdust, which has become such a nuisance at Minneapolis and along the river below that growing city, offers a promising field of enterprise for whoever will utilize it. Several applications have already been made of it, and now arrangements are being made by a French manufacturing chemist for the establishment, at Minneapolis, of a laboratory to make from the sawdust an acid, now imported from France, and largely used by dyers, chemists and druggists. It is to be hoped that the enterprise will be successful.

THOUGHT RULES THE WORLD.—It makes no noise, but lives on and reigns when all the hustling and shouting that seemed to stifle it are hushed, and whilst the great works, which it guided the hand of man to do, have either perished or remained to tell of a pomp and vain glory gone forever. Thought is with us in the words of wisdom that "Shall not pass away," and to which we do well to give heed.

BUSINESS on the Union Pacific is so heavy that for some time the orders for freight cars in a single day have been nearly 2,000 more than could be supplied. Nearly all the railways are now working to the full limit of their equipment, and many have to decline offered business. What a time to inaugurate a war of rates, and throw money away.

The Mining Share Market.

There is no special improvement to note in the stock market. The situation remains about the same in most of the mining districts. On the Comstock, since the election, work has been fully resumed at all points, and the *Enterprise* says:

Some changes worthy of note will probably soon be seen at the north end, where winze No. 1, in the Union Consolidated ground, has reached quartz that is almost good enough to be called ore. It is expected that an east drift from the bottom of this winze will develop paying ore, as the whole formation at that point appears to be making to the eastward. In the Ophir and Mexican mines they are still running connecting drifts and winzes and doing other work that is preparatory to prospecting. In the middle mines the main south drift on the 2,400 level of the Chollar has been pushed into Potosi ground. At this point there is a great area of ground that has never yet been explored. This reaches up to and in many places far above 1,900 level.

The Belcher folks are prospecting both

THE Downes mill, Amador county, is completed.

The Remedy for the Phylloxera.—No. 2.
[Written for the PRESS by J. H. WHEELER.]

Having given in article No. 1 (in SCIENTIFIC PRESS of Nov. 6th) the position which the bisulphide of carbon occupies as an insecticide; having alluded to the manner in which it has superseded all other remedies for the phylloxera, and also to the manner in which M. Marion opens the *Rapport du Comité Regionale*, I will now proceed to examine the first part of the report, consisting of an exposition of the experimental work of the *Comité* in 1877.

Chapter I. gives a biographical sketch of this insect. In order to operate on the phylloxera, its changes must be known. The result of the *Comité*, in following its metamorphoses, corresponds closely to that given by Prof. Hilgard, of the University of California; it is, briefly, as follows: The insects are to be found safely ensconced on the roots of the vines during the months of December, January, February and March. These months make up the period of their hibernation. If the climate be exceedingly cold they hibernate in the egg; but in countries like France and California, the tendency is to winter without change of form. The insect then continues during this period in a torpor, from which they awake during the first part of April. Then begins their parthenogenesis; if the weather be cold they do not pronounce their eggs until the middle of the month. The new generation of insects are attached to the roots, and continue to reproduce without sexual inter-

climatic changes of California will render it necessary to apply it about the last of December, or in January—but here arises the difficulty of plowing—it cannot be put into the ground after the soil has been agitated or worked.

Chapter II. treats of experiments to determine the diffusion of the bisulphide of carbon in the soil. For, understanding this, suppose 5 or 20 grams of liquid bisulphide be placed in the soil by the proper instrument. It immediately begins to diffuse; if the soil be warm and loose, the diffusion is rapid, if cold and compact, less rapid. Now we want to know how far the vapor penetrates the soil from the point of insertion; how long, after insertion, it is before the liquid is all evaporated, and also its toxic strength at different distances from the point of injection, and at different times afterwards. To determine this an apparatus is constructed, consisting of an aspirator attached to a tube with holes in its lower end; this tube being inserted into the ground, the aspirator is set to drawing in the atmosphere which surrounds the tube underground, this atmosphere being drawn through a strong solution of potassium in alcohol. If there be any of the gas of bisulphide of carbon in this atmosphere which is drawn from underground, it forms with the solution of potassium the xanthate of potassium (thus $CS_2 + (C_2H_5)_2KO = (C_2H_5)_2KCO_2S_2$). This xanthate of potassium, on being neutralized with acetic acid, gives, with a drop of the sulphate of copper, a bright yellow precipitate, thus forming the xanthate of copper. Now, by the density of this precipitate, the strength of the toxic atmosphere can be approximately determined from the point at which the tube is inserted.

The results of two of these experiments I

times of year. In a compact clay soil it was found that in March the vapor continued sufficiently effective for seven and one-half days, and from that on its presence was scarcely noticeable more than 25 c. m. from the point of injection. In a loose soil at the same time the vapor continued effective only six and one-half days. In the month of April, the same two soils were tried again and the results gave six and one-half days in the compact soil, and five and one-half days in the loose soil.

The humidity of the soil is another important element, excessive moisture retarding the diffusion and giving it longer time to operate. It is seen by the curve that the energy of the vapor is not directly proportional to the amount injected nor is the distance it traverses; in this case the proportion in quantity injected being that of one-fourth and the distance or energy of the vapor nearly one-half, and from this we are able to economize, and also to determine, when there are to be two successive applications, how soon the one must follow the other, which as we have stated, is an interval of six days in winter and four days in summer.

Thus far we have spoken only of the horizontal diffusion of the vapors. In these experiments the liquid was inserted about 40 c. m. or nearly 16 inches; below the surface the passage of the vapor is downward, and laterally into the ground. The rate of diffusion with all gases is inversely proportional as to the square of their density. Now the density of bisulphide vapor being very great, its diffusion is comparatively slow; in fact, it is because of its superior specific gravity that it is so valuable for this purpose. It is on this account that it is so successfully applied to the killing of squirrels, for

proceed as follows: A large number of wire cloth nets are made cylindrical in shape, and 12½ inches in length. Into these are carefully placed roots taken from the vine, placing a number of lengths (on which a uniform amount of phylloxera are attached) into each. A large number of the nets being thus prepared, they are, after each has been attached to a wire, to which is fastened a numbers tag, placed underground at a depth of about two ft., and being planted at measured distances from each other, we have to all intents and purposes a vineyard hadly phylloxered. It gives, when the earth is carefully placed about the nets, the normal condition of the insect, and yet perfectly under our control. A few days are allowed to elapse before applying the reagents, in order to make the conditions perfectly natural; then the bisulphide is injected at different distances from the nets, and in different quantities—not to a single net, but to a field of from 100 to 150 nets is each experiment applied.

One trial may be with these constructive vines six ft. apart; another with them four ft. apart, and so on, thus obtaining results which may apply to the different vineyards. After a proper interval succeeding the application of the insecticide, the nets are removed and examined, and the per cent. killed determined—the numbering and classifying by tags before being placed in the ground conducing to great accuracy.

In this chapter, after the presentation of the above scheme for determining the mortality of the insects under experiment, there follows a report of the results obtained. These cannot be given here, but a few facts may be added, illustrating the general results, as follows:

CURVE REPRESENTING THE DIFFUSION OF BISULPHIDE OF CARBON AS DETERMINED BY FRENCH EXPERIMENTS.

course until about the 20th of July, after which, little stumpy wings appear, and with them they fly forth to the leaves. Until September they continue to swarm above ground, and have even been found above ground as late as the 14th of Oct. The winged insects, which appear about the 20th of July, inhabit the leaves, and by their sting raise a gall which grows up and surrounds them; each insect in the meantime lays from 100 to 200 eggs, and then dies in the gall. From these eggs a wingless lice are brought forth, which feed on the leaf and reproduce without sexual intercourse. Here for the first time appear the males and females, and during the following period their union is active. Now the female lays a single egg from which, in September, the mother root-lice is produced. Again descending to the roots of the vine, the cycle is repeated similarly the next year. If the vine be one not suitable to the above ground life of the insect, it may continue for eight or ten generations to reproduce underground. Its metamorphosis is also influenced by the weather, occasionally skipping some intermediate stage of its successive development to conform to its environments.

The change which the phylloxera undergo in California are probably similar to those which they undergo in France; but we see that some particular stage may be left out, and still the following phases be the same. We do not seem to have the winged variety as numerous as in France; but of this we are certain, that they do infest the roots, and that they hibernate without the egg. This renders them available to the winter application of the bisulphide, which might allow them to survive if they were to hibernate in the egg. The State Commission will tell us how closely the California phylloxera follows in its habits that of France and other countries, after they determine the same by experiment. Professor Hilgard thinks we shall need to apply the bisulphide later in the year than it is applied in France. That the

have given in the chart which appears on this page. The dotted line gives the diffusion of 5 grams of bisulphide obtained in November and December, 1877; and the continuous line the diffusion of 20 grams, obtained in November, 1877. Distances measured on the horizontal lines indicate the length of time after the injection, and distances measured on vertical lines indicate the distances from the point of injection to which the vapor has penetrated the ground. Thus, if we desire to know how far the vapor from 20 grams has penetrated the soil later after two days or 48 hours, we look under the number 12, indicating midday of the 14th of November, and find by measuring on the scale to the left of the chart marked centimeters, the height to which the line passes at this point. Thus, we have in centimeters the distance desired, which in this case is 170 c. m. or 5 ft. 6.76 inches.

This happens to be its greatest diffusion for 20 grams, but likewise the diffusion can easily be determined for any other time. The state of the atmosphere is also marked by the scale on the extreme left of the chart. To reduce these figures to Fahrenheit degrees, the scale used in this country, multiply by 9-5 and add 32. By this chart we are able to ascertain the distances which the vapors traverse, and also just how long it continues to act—the 5 grams acting 8 days and the 20 grams 15 days. We have, then, the substance under our control, and are certain of so much. The curves, it will be seen, oscillate with the temperature, at midday being highest and increasing with the temperature. The chart from which this was taken exhibits the harmonical pressure at the different periods and also the conformity of the diffusion to the temperature, which I am unable to give here. With the temperature it follows with exactness, but with the harmonical line it varies with great irregularity.

Many other curves were formed by varying the amount, the nature of the soil and the

the vapor flows down a hole much as water would do, so it penetrates all the interstices in the soil and passes downward and outward; a small portion passes upward, but the intensity of this decreased as we approach the surface and unless the amount be very large there is no perceptible loss by passing off from the surface. Many other chemical vapors might be found which would kill the phylloxera, but few, indeed, would serve the purpose of such economy as does the bisulphide of carbon in sinking immediately to the desired spot.

The most favorable depth seems to be about 16 inches, for if nearer the surface there might be an appreciable loss by evaporation, and if deeper the injecting would require other than hand labor. This is a convenient depth, and has been adopted by all experimenters as the best adapted to serve the end desired.

Now I believe we have the vapor under our control, and in determining its toxic effect on the insect, we may proceed intelligently. We know already that it becomes practicable, that it can be made to reach the infested parts, and we know its diffusion. We also know it to be a poisonous vapor, that it kills vermin and insects generally, and even animals, and from this we might infer that it would deal death to the phylloxera; but we are not here proceeding inferentially, but require actual, positive proof of this fact, which we will now proceed to examine in the next chapter, entitled "Determination of the energy of the bisulphide of carbon as an insecticide." The great object here is to get at the normal condition of the phylloxera, that the results of the experiments may extend accurately to the work on a large scale, which the experiments are designed to assist. The plan adopted, therefore, is not to take the insect from the ground and bottle him up in an unnatural condition, nor yet to treat it on the vine as first found, for in this case we should be unable to determine accurately the percentage killed or allowed to survive, but to

On the 18th of October, 1877, 100 nets planted in a gravelly soil, 1 meter (39.27 inches) apart. Treated with bisulphide on the 22nd of October at rate of 16 grams (.0352 lbs.) per tube, or 16 grams per square inch. Each 16 grams was divided and supplied 2 holes on opposite sides of the nets, thus, in the middle, between every 2 vines 8 grams was injected. Temperature of the soil, 19½ C., or 67.1° F.

The result of this was, out of 244 rootlets thus encased, buried and experimented on, only 30, on the 31st of October, nine days after the application of the bisulphide, had any of the phylloxera yet alive on them. From the proportion, then, of 244 : 30, we have, by the simple rule of three, the percentage not exterminated, viz: 12.32, the remaining percentage, we designate the coefficient of the insecticide.

Repeating this treatment after six days effected a complete extermination. A great number of conditions, varying from the above in soil, time of year, distances apart of the nets, etc., were experimented upon, and the following were the most important conclusions arrived at: The work is more satisfactory, and the vapor acts with greater efficiency in a compact soil than in a loose one; a moist condition is more favorable than a dry one; the soil should not be moved or cultivated until at least six days have elapsed after the final application; the quantity of bisulphide should be slightly increased on the margin of the vineyard, or else the application extended to some distance beyond the margin of the plat, as the diffusion is here more rapid, because of there being no tension of neighboring injections to oppose, thus rendering diffusion too rapid. These results can be relied upon as falling within the true estimate of the energy of the vapor, for the roots in their natural ramification approach nearer to the point of injection, and many being lower down than the nets were placed, receive a more marked effect of the vapors, whose toxic strength increases with the depth when reaching no lower than the roots of the vine penetrate.

It is by the above-mentioned experiments

also, that it was determined, as stated in my first article, that if a single application is relied upon, it must be 55 grams per square meter—such figures as 40 grams and 37 grams can never be relied upon; that if extended to two applications, however, a total of 23 to 32 grams per square meter, or 15 or 16 grams per square meter, injected each time, the second, after an interval of six days in winter, and four days in summer, is sufficient, each of these 16 grams being placed in 2 holes of 8 grams each. In connection with these experiments with the bisulphide of carbon, a number of trials were made with the mixtures of bisulphide, with heavy and green oils of anthracene, such as have been introduced for insecticides. In all these cases it has appeared that a slight additional amount of bisulphide was required to effect the results obtained by the bisulphide alone, besides the amount of oil or other substances with which it was mixed, the oil increasing the diffusion at first and retarding it afterward. It was proved also that the oil possessed no virtue in itself, and served only as an additional expense.

There remains yet the chapter on the effect of the bisulphide on the vine itself, then a few results of experiments on a large scale and experiences of French viniculturists not on this committee; this will be followed by directions for handling of bisulphide, estimates of expense of using it and cost at which it will be furnished from the manufactory on this coast.

Bodie District.

Whoever thinks that Bodie has seen its best days is but poorly informed of the satisfactory condition of things—not in the stock market, but in the lower workings of the mines of Bodie district at the present time. The *Free Press* has never been and cannot fairly be accused of extravagant statements in relation to individual mining properties. Had it been less careful in its statements and conclusions at certain times, it might possibly have been more to the interest of its publishers, in a certain sense, but it could hardly have enjoyed at the same time the reputation for integrity and evident desire to avoid leading the public into unsafe investments that it does to-day. The writer can say without reserve, and with an intimate knowledge of the mines of Bodie district since April, 1878, which has been interrupted but by two weeks absence in that entire period, that there never has been a time when the camp looked so substantial, when so many mines could show rich ore, and when there was such assurance that they would continue to great depth, as at present. The Bodie has as good a showing at a vertical depth of 600 ft. as it ever had above. Six hundred ft. in the Bodie or Jupiter are equivalent to about 700 in the Standard. Why should not the Standard have rich ore in the 700, or if it has not—which is not conceded—why should that fact be depressing, if there is rich ore 200 ft. south of the Standard, at the same depth? High peak and Bodie bluff can take care of themselves, and will have paying mines for years to come. But outside the hitherto producing portions of the district comes a new candidate for public favor, and one that gives promise of doing greater things than have been done by the old Peak—that is, Silver hill. A wonderful silver ledge runs through that hill. It was first discovered in the Addenda and then in the Oro; it has been traced in the Dudley, and now, at a deeper point than in any of the others, and relatively more compact and rich, it is in course of development in the Concordia. That it will be found in the Queen Bee Hill mines is every way probable, the University formation at its lowest workings being identical with that in the other mines named. Now here is a ledge traced for 2,500 ft., in what all old Comstockers pronounce an immense "formation," and which is exceedingly rich at a great number of different points, and which shows a most remarkable improvement every time it is struck at increased depth. Its development has heretofore been hampered with water; but the magnificent working of the Red Cloud, the expense of which is being borne in equal proportions by seven adjacent mines, will soon render that a question of the past. The Noonday ledge, it should be recollected, is a separate proposition, several hundred ft. west of the Concordia ledge. The best feature of the work at the south end is that it is in the hands of men who have the financial ability to carry out the very extensive work now under way, and who are thoroughly justified in the outlay they are making by the ore almost in sight.

MINING STRIKES.—To some it may seem strange that the most important discoveries are made late in the summer; but if they will only remember that miners, as a rule, do not begin to work on their prospects till the summer has fairly set in, the matter will be somewhat clearer. All prospectors are not well fixed financially, and those who strike out for a season's prospecting find themselves short of funds in the fall, if not in debt. They seek employment for the winter in some of the paying mines, and when the snows have disappeared, are ready to try again. The prospects located the summer before are worked on. Assessment work being done, a consultation is held and all work is then concentrated on the prospect that looks the most promising. It takes time to sink shafts and run prospecting drifts; and when the snow begins to fly, happy is he who can say "I've struck it."—*Salt Lake Tribune.*

USEFUL INFORMATION.

How to Preserve a Carriage.

Mr. Starey, a prominent carriage manufacturer, of Nottingham, England, in a series of useful hints on their preservation, says that a carriage should be kept in a tight coach house, with a moderate amount of light, otherwise the colors will be destroyed. There should be no communication between the stables and the coach house. The manure heap or pit should also be kept as far away as possible. Ammonia cracks varnish and fades the colors both of painting and lining. A carriage should never, under any circumstances, be put away dirty. In washing a carriage, keep out of the sun, and have the lever end of the "setts" covered with leather. Use plenty of water, which apply (where practicable) with a hose or syringe, taking care that the water is not driven into the body to the injury of the lining. When forced water is not attainable, use for the body a large soft sponge. This, when saturated, squeeze over the panels, and by the flow down of the water the dirt will soften and harmlessly run off, then finishing with a soft chamois leather and oil silk handkerchief. The same remarks apply to the underworks and wheels, except that when the mud is well soaked, a soft mop, free from any hard substances in the head, may be used. Never use a "spoke brush," which, in conjunction with the grit from the road, acts like sandpaper on the varnish, scratching it, and of course effectually removing all gloss. Never allow water to dry itself on the carriage, as it invariably leaves stains. Be careful to grease the bearings of the fore-carriage so as to allow it to turn freely. Examine a carriage occasionally, and whenever a bolt or slip appears to be getting loose, tighten it up with a wrench, and always have little repairs done at once. Never draw out or pack a carriage into a coach house with the horses attached, as more accidents occur from this than from any other cause. Top carriages should never stand with the top down, and aprons of every kind should be frequently unfolded or they will soon spoil.

DON'T BLOW INTO YOUR WATCH.—A correspondent of a German paper calls attention to the injudicious practice of blowing dust off of the watchwork. He says that the operation looks so harmless that but few ever think of the destructive consequences attendant on the contact of humid breath with polished steel surfaces and springs. At lower temperatures a kind of veil covers the parts at once after blowing, which gradually disappears again, but it is in fact nothing else than a watery deposit, or steam reduced to water. Generally the deposit evaporates as the object gets warmer, but this is not always the case. Many watchmakers are sometimes dotted over, apparently with particles of dust, which on closer examination are found to be rust. Perhaps many have been puzzled to account for rust spots between the coils of a spring, very minute, but still sufficient to render the article useless. These serious defects, says our authority, may in most cases be put down to the evil influence of warm breath, microscopic particles of water, for want of sufficient heat to evaporate, having remained on the surfaces and done the mischief described.

THREAD FROM WOOD.—The manufacture of thread from wood for crochet and sewing purposes has, it is said, recently been started at the Aby cotton mill, near the town of Norköping, in the middle of Sweden. The manufacture has arrived at such a state of perfection that it can produce, at a much lower price, thread of as fine quality as "Clark's," and has, from this circumstance, been called thread "à la Clark." It is wound in hells by machinery, either by hand or steam, which, with the labeling, takes one minute twelve seconds, and the balls are packed up in card-board boxes, generally ten in a box. Plenty of orders from all parts of Sweden have come in, but as the works are not yet in proper order, there has hardly been time to complete them all. The production gives fair promise of success, and it is expected to be very important for home consumption.

TO MAKE GOOD VINEGAR.—Some one asks the *Phrenological Journal* why it is so difficult to get good cider vinegar now-a-days. The editor replies as follows: "The main reason is that genuine cider vinegar can't be made in a hurry. A good article of cider will be two or three years in becoming vinegar, unless kept at a high temperature, when a few months may suffice. The larger portion of that sold as cider vinegar is as innocent of apple juice as possible. Better not use the sour stuff anyway; but eat fruit which will supply a form of acid more suitable to your stomach."

LOBSTERS are cultivated in a salt water pond on the New England coast. The pond covers 30 acres, and is so arranged that the water is partially changed at each tide. The food supply consists of refuse from the Boston fish markets, and during the first year 15,000 marketable lobsters were sold.

The Russians keep fish perfectly sweet for a long time in the hottest of weather by dipping them in beeswax, which forms an air-tight covering for them.

Spontaneous Combustion of Charcoal.

Among the substances subject to spontaneous combustion, according to the *Fireman's Journal*, pulverized charcoal is said to be one of the most remarkable. Incidental to this phenomenon a story is told that a load of charcoal was delivered in an outhouse of a clergyman in Leipsic, and showed no signs of burning until the door by accident was left open, when the wind blew sprinklings of snow on the charcoal. The rapid absorption of oxygen from the melting snow caused the charcoal to ignite, and as this day was windy the whole range of buildings was burned to ashes. In this connection a fruitful and unsuspected source of fire suggests itself to those of our American housekeepers who burn wood as fuel, and who store the ashes in boxes or barrels. The accidental disturbing of such ashes, even after years, will cause them to ignite, provided the air is damp or foggy. The phosphuret of potash from decayed wood renders wood ashes highly inflammable, and mysterious cellar fires in the rural districts are, no doubt, in some cases, caused by this form of spontaneous combustion.

NEW USES FOR SAW-DUST.—The *Lumberman* says: We have been shown a model of a car wheel consisting of an iron rim of seven inches outward diameter by one-half inch thick, fitted with a well-proportioned hub, the space between the hub and rim filled with pine saw-dust, pressed in so solidly that we are ready to believe the assertion that resting the iron rim upon bearings, a pressure equal to 23 tons applied to the hub failed to develop any signs of weakness. We hesitate in these days of progress to assert that anything is impossible, and we begin to think that even saw-dust possesses elements of value hitherto unsuspected, and that the day may come when the filled grounds adjacent to all saw-mills may be seen to have a great value in the mechanical development and utilization of the now useless debris placed upon them to get it out of the way. Saw-dust car wheels, saw-dust brick, saw-dust fence posts, railroad ties, and even saw-dust window and door frames, wainscoting and moldings, begin to appear among the possibilities of the immediate future.

GOOD HEALTH.

Curing Disease by Fasting.

It appears that Dr. Tanner is not the first person who has practiced upon the idea of curing disease by fasting. The North Adams, Mass., *Transcript* gives the following: "A propos to the experiment of Dr. Tanner, who, in New York, attempted to live 40 days without food of any kind, the experience of Mr. John F. Arnold, of this town, may be interesting. Mr. Arnold, as is generally known, is a radical upon the subject of health and medicine, and advocates theories which, to the majority of the people, appear dangerous and unwise. His story is in substance as follows: In 1839 he was very ill, and his physicians gave him little hope of permanent recovery. This fact led him to study medicine and the care of himself. About that time Dr. Graham, the well-known founder of the Grahamite system, came here to lecture, and Mr. Arnold attended the lectures and became a thorough convert. He afterward studied books supporting Dr. Graham's views, and from that day to this he has been a consistent believer in the doctor's theory. In 1847 Mr. Arnold studied the books of Dr. Jennings, of Oberlin College, and embraced his theory that disease was not an enemy of the human system, but was simply nature's method of repair, and was right under the circumstances. "The first opportunity to put his theory to practical test was in 1865, when, after a season of hard work, and being thoroughly exhausted, he was prostrated with bilious fever. Dr. Hawkes was summoned, and said that escape from the usual 21 days' sickness was impossible. The doctor called regularly and left his medicines, but Mr. Arnold did not take a drop of them, and allowed no nourishment to pass his lips, except pure water, for 24 days. For over three weeks he existed without a particle of food, and then he began to eat and regain his strength rapidly, increasing 15 lbs. in 18 days. Not until he was entirely cured did he reveal his course to the doctor.

"Again, in 1872, after the fright and exhaustion caused by the burning of the Fifth Avenue hotel in New York, where he was stopping at the time, Mr. Arnold was again prostrated with bilious fever. This time he called Dr. Lawrence, and told him that he intended to fast again during the three weeks of the illness, and the doctor consented to watch the progress of the case. The result was the same as before, Mr. Arnold coming out of the fever stronger than ever, having taken nothing into his system for 24 days except water. Mr. Arnold's theory is that nature, if let to herself, if the system be not broken down by previous excesses, will 'repair the machine' better than if hindered by drugs and medicines and other unnatural things."

It may be remarked in this connection that, while Dr. Tanner commenced his experiment in perfect health, Mr. Arnold was, in both instances, exhausted to begin with; but, in his case, the time of fasting was only about one-half that which Dr. Tanner endured.

The Willow as a Preventive of Malaria.

Mr. Von Lennep, the Swedish Consul, writes from "Mahazik, near Smyrna," to the *London Times*, as follows: "Before the eucalyptus was ever heard of in Asia Minor, I had seen the bark of the willow used as a febrifuge. I had remarked the easy and inexpensive reproduction of this tree, its quick growth in damp places, its excellent qualities for fuel and for agricultural implements, and its great advantages for strengthening the banks of capricious streams, and had thence taken every opportunity after the winter floods to stick willow cuttings along the banks of streams and in other damp places in my property; also to scatter plane-tree seeds in marshy spots. The result has been that, whereas 20 years ago the full-grown trees in this neighborhood might have been counted, a luxurious growth of willows and plane-trees marks my place, fuel is abundant, fever is steadily decreasing, the malarial propensities of the streams are checked, my neighbors have to come to me for agricultural implements, and I have not had to go for timber for rough purposes."

It may be interesting to observe in this connection that the comparatively new but well-known antiseptic preparation known as soliceine is derived from the bark of a certain species of the willow. It is of a pure, bitter taste and highly febrifuge in quality. It is largely used in various solutions, in surgical operations, and is the most effectual preventive of putrefaction in the system known.

Constipation.

It is doubtful if consumption numbers as many victims as are stricken down by the various diseases that result from habitual constipation. True constipation is an inherited disease. It may remain always dormant, but when aroused to action, decay commences at a point circumscribed, and gradually extends—unless arrested—until so much of the lungs become involved that vital action ceases. The evils of constipation result from inattention to the calls of nature, and usually commence with children whose habits are not closely looked to by their parents.

The processes of nature are always active while life lasts. When effete matter is retained a moment beyond the time its expulsion is demanded, the system commences its efforts to get rid of it. When the natural egress is checked, the absorbents carry the more fluid portions of the poisonous mass into the circulation, and it becomes diffused throughout the body. The more solid or clay-like portion is forced into the lower rectums where it becomes firmly impacted, thus cutting off the circulation in the small blood vessels, causing painful engorgement known as piles and hemorrhoids. A continuance of these troubles often results in fissure, fistula, or cancer. The trouble is seldom confined here. As a result of the blood poisoning we almost invariably find more or less dyspepsia, with decided derangement of the functions of the heart, liver and kidneys, accompanied by headache and nervous debility, often verging on paralysis. —*Hall's Journal of Health.*

THE SLEEP DISEASE.—Mr. Talmy has presented a note to the French Academy in which he calls attention to the analogy which exists between the "sleep disease" and chicken cholera. The sleep disease (*melanra*) is a rare affection which, up to the present time, has been met with only among the negroes of the west coast of Africa. It was first made known by English physicians in 1819, but was not accurately observed till many years afterward (1862 *et seq.*) by the French physicians, Danguais, Nicolas, Guerin, and very recently by Corré. In this curious affection the person attacked keeps his eyes half closed, as if he were unable to open them wide, and is frequently seized with a profound desire to sleep. Later on he sleeps continuously, and has to be awakened to take nourishment—which he does with pleasure if he is awakened sufficiently. Death approaches very gradually but surely, and the victim passes away at length without suffering any pain. The disease is always fatal, no cure yet being known for it. From the symptoms as given by the above mentioned physicians, and from the symptoms of chicken cholera as studied by Moritz, Perroncito, Toussaint, and more recently by Pasteur, M. Talmy believes that the two diseases are of a similar character, and both due to a like cause.

SMOKING IN GERMANY.—It appears that the German government has taken the matter of smoking seriously in hand, the practice being carried to so great an excess by the youth of that nation that it has been considered to have damaged their constitutions and incapacitated them for the defence of their country. In certain towns of Germany, therefore, the police have had orders to forbid all lads under 16 years of age to smoke in the streets, and to punish the offence by fine and imprisonment. Moreover, a Belgian physician has ascertained, during a journey of observation and inquiry made at the request of the Belgian government, that the very general and excessive use of tobacco is the main cause of color blindness, an affection which has occasioned very considerable anxiety, both in Belgium and Germany, from its influence upon railway and other accidents, and also from the military point of view.

The Week.

Now that the election is over, there is a very general tendency on the part of everybody to tall everybody else to go to work in earnest, and help make good times. The advice is very good, and in the mining sections there is an evident desire to follow it. At present, on this coast, times are hard. East of the mountains they are lively. Our turn will come again before long, however, and we should all help it coming.

In this latitude the weather continues warm and pleasant, with no present indications of rain. The health of our city certainly is not good, just now, but the "small-pox scare" is over, being quickly stamped out by very general vaccination.

Our first cool, frosty nights occurred this week; the only indications so far of approaching winter, aside from the shortening days.

There is no special mining news to note, other than is given in our "Mining Summary," in other columns of this issue. Utah seems to be coming to the front as a steady and pretty large bullion producer, and at the end of the year will perhaps surprise some of us at her aggregate yield.

The Forest City Free Press says: Monday night last the locomotive was bringing 19 loaded cars out of the Bald Mountain mine when on the "little grade," about a quarter of a mile from the mouth of the tunnel, one of the connecting chains broke and 14 of the cars got away. They came out of the tunnel like a shot out of a cannon, swept around the curve in the rear of Redmond's saloon at a frightful rate of speed and piled up in the dump. Six of them were hopelessly wrecked.

A CORRESPONDENT writes us from Tucson, Arizona, that the mines are all looking well and new ones coming to the front every week. "Capital is here and more coming. The weather is delightful."

Mining Engineers.

The title of Mining Engineer is conferred by a school of science, indicating that the student has pursued a full course of mining engineering, and has graduated creditably. It is just the same as M. D., Ph. B., A. B., etc., in this respect. But as we see a good many add the M. D. to their names who are mere quacks, so also are there many with an M. E. who are just as much quacks.

Nobody is entitled to the name who has not had it conferred upon him by a legitimate institution. He may call himself an assayer, surveyor, or expert, if he chooses, but, legitimately, not mining engineer. The medical profession jealously guards its title, and makes it hot for those who wrongfully assume it when possible. The mining engineers, however, let the quacks in their line go, thinking their employers are sufficiently punished from the mere fact of employing them.

In reality there are very few mining engineers, and the present number is not annually increased to any material extent. Our own American colleges having mining schools are the University of California; School of Mines, Columbia College, New York; Rensselaer Polytechnic School, Troy, N. Y. There are also the Lawrence School, Harvard College; Stevens' Institute of Technology, Hoboken; Sheffield School, Yale College, and a few others of less importance. The graduating classes at any of these institutions are exceedingly small, the largest only turning out half a dozen or less a year. The foreign schools do not send us very many mining engineers, but they usually send pretty thorough ones.

There is no doubt that we need more good mining engineers than we have, as there is always a demand for men of thorough practical education and skill to conduct our mines. These men should be encouraged in every way to come among us. But this is no reason why every assayer, superintendent, foreman or mineral surveyor who chooses should take to himself the suffix M. E. Those who do are sure to misrepresent the profession, and it is this fact which has frequently brought discredit on a useful and highly cultivated class.

We have seen reports on mines from self-styled mining engineers that were perfect curiosities of illiteracy and pseudo-science, abounding in recklessly applied geological and mineralogical terms, and written without any regard whatever to the rules of grammar. The presence of bad spelling and garbled scientific phraseology in a report is in itself sufficient evidence that the writer is destitute of thorough scientific training, since it is a moral possibility that any graduate of a respectable school should fail in the rudimentary branches of education. We saw, not many months since, a manuscript report on a mining property in this State, signed with the writer's name and M. E. after it, and on the first page was a photograph of its author. This was surrounded with flourishes without number, and was evidently intended to embellish the report. It preceded the diagrams and sections, which were well drawn, but the photograph was apparently of more importance in this "mining engineer's" opinion. It advertised him.

First-class mining engineers receive high pay for their services, and it is this which causes so many imitations. The spurious article reaches its level in time, but is apt to do great harm before this downfall occurs.

NEW MAP OF BODIE.—We have received from Messrs. Anderson & Eysen, a very large, new and complete map of Bodie District. Making the envelope and compiling the data for this map have, we are informed, occupied some two years. All the claims have been surveyed and properly placed, the map having been made for no particular companies. It is seldom we see so much painstaking to produce so complete and illustrative a map, conveying, as it does, so much to the eye at once. Around the map is a series of views of the more prominent mines, and one general view of the district. There are 29 of these sketches, all of them very well executed. As far as we have seen this is the most complete mining district map which has been published here. It will soon be for sale by Payot, Upham, & Co., but at present Ernest G. Moss, No. 11 Geary street is agent, and to him applications for the map may be addressed. Accompanying the map is a small pamphlet giving the date of location and record of each claim represented.

A NEW REGULATION.—Applicants for desert lands, the Register and Receiver as now directed, shall publish for 30 days a notice describing the land and naming the time and place at which he will submit proof as to the agricultural character thereof. The Register and Receiver will also post a notice in their office for the same period. When the claimant shall appear to exhibit proof the Register and Receiver will require him to furnish the affidavit of the publisher of the newspaper in which the notice was published showing that the same was published for the period required. Should no mineral claimant appear the Register and Receiver will receive the ordinary non-mineral affidavit; should mineral claimants appear the Register and Receiver will proceed to order a hearing.

The State Mining Bureau.

All persons from the interior and interested in mining, when they come to this city should not fail to visit the rooms of the State Mining Bureau, 313 Pine street between Montgomery and Sansome. The rooms are only half a block from the office of the MINING and SCIENTIFIC PRESS. As our readers know by previous articles in this journal, the State Mining Bureau was a creation of the last Legislature, and formed under an act introduced by Joseph Wasson, of Mono county.

The State Mineralogist, Henry G. Hanks, has succeeded, in a short time, in collecting a comparatively large amount of material for the museum. The specimens of rocks, ores, minerals, etc., are all duly identified, classified and labeled, and neatly arranged in convenient cases for exhibition and examination already, although the Bureau was only organized for work in June. The collection is larger than any ever before brought together in this city, and it is constantly increasing. Mr. Hanks has devoted many years' time to collecting minerals on this coast, and is familiar with all the localities where they may be obtained.

There have been collected also, a large number of maps of different sections of the State, and a great deal of other material, which will be found of interest to the mining community. Mr. Hanks will from time to time add to the stock of books until a complete mining and metallurgical library will be formed.

The Bureau began with a good donation of ores, rocks, fossils, reports, books, etc., from the State Geological Society. Since then additions to all the departments have been constantly made.

Mr. Hanks will publish an official report next year in which will be found a large mass of information now being collected by competent assistants in the employment of the Bureau. This will cover a good deal of ground, but will naturally be more particularly applicable to the conditions existing in California. It will embrace a history of mining in this State, descriptions of the metallurgical process, the mining and metallurgical machinery, system of quartz and gravel mining, and kindred subjects.

The co-operation of the public is of course necessary to make the Bureau instructive and attractive, and specimens of ore and minerals will be gratefully received. Visitors will be surprised to find how much of a "show" the new Bureau makes, in view of the fact that it was so lately organized.

NEWS FROM TOMBSTONE, ARIZONA.—A dispatch from Tombstone, Arizona, recently, says the mines are looking first-rate. The Toughnut has made a big strike in the northwest shaft. This morning Contention broke into a good ore body on the 400 level. The Grand Central is still improving. The strike in the Girard improves with every foot of progress. The Head Center and Sulphurett continue to develop most favorably. In the Empira the mine commenced recently to cross to the ledge from the bottom of the main shaft, which is now down 450 ft., being the deepest shaft in the district. The simple fact is that the principal mines of this district are in excellent condition, and never looked so well as they do to-day. The question of title to town lots in Tombstone is at present exciting much interest here. The matter is a complicated one, and may result in serious difficulty. A company composed of J. R. Clark, M. Grey, J. D. Rouse, and J. Palmer, made the entry of a town site. The patent therefor has been issued and is daily expected here. Under this patent the aforesaid company claims title to all the town lots, occupied and unoccupied, not heretofore disposed of by them. The possibility of fraud in this matter has been hinted to many times, and it is now charged that the title claimed by the aforesaid company could have been obtained by fraud only. The *Epitaph* has published a two-column article exposing the whole scheme.

GO DOWN.—In a letter to the Salt Lake Tribune, from Bingham, a correspondent says: Mining matters in Bingham appear to be awakening from their dormant condition and affairs are assuming more of a business activity than has been seen during the past summer. More enquiries are being made after mines, and there is a strong feeling to purchase. Several good pieces of property are likely to change owners, and the coming winter may see property that has lain idle for some time start up under a new regime. The question of the pyrite belt appears to be somewhat of a mastodon; none of our mine owners dare to encounter it, they either lack pluck or are afraid to put the question to the test to win or lose it all. It is an old saying among Cornish miners that "Mandic rides a fine horse," and if some of our wealthy mine owners, instead of gophering and scratching on the surface would tackle this momentous doubt, they would be somewhat astonished if they struck ore beneath the belt that would bring them in millions for their small outlay.

Our silver product for the fiscal year ending June 30, 1880, was about \$38,000,000, or \$2,000,000 less than for the previous fiscal year. All but about \$10,000,000 of the product was coined into standard dollars.

Mining Under the Sea.

The only mining ever attempted under the sea on this coast was when efforts were made to pump up the golden sands lying at the bottom of the ocean off Gold Bluff, on our northern coast. This was not successful, however. In England some of the mines have been run out under the ocean. In Northumberland the net available quantity of coal under the sea is estimated at 403,000,000 tons; and on the Durham coast under the sea, including a breadth of three and one-half miles, with an area of 71 square miles, 734,500,000 tons. This latter is said to have an aggregate thickness of 30 ft. distributed in six seams, but how it is to be worked is a problem to be solved in the future, and with respect to which there are and will be many opinions.

As to the coal under water, it has been estimated that the coal will be worked under the sea a distance of three and one-half miles by means of land collieries, and that a further breadth of seven miles may be worked by sinking shafts for ventilating in the sea itself. To what actual distance from the shore coal will be available is a question that cannot be readily answered, as much will depend upon the depth, thickness, absence of faults, as well as the nature of the strata, and the depth of the sea-bottom. The London *Mining Journal* thinks, however, that unless large provision is made for preserving proper means of access to the distant sea coal, vast tracts of the coal in all probability will be lost. It appears to be considered practicable by means of machinery to work coal even or eight miles underground, so long as access to it was not shut off. But if during the next few years a barrier of a mile or a couple of miles of crushed waste or coal is interposed between the land and the remaining miles belt of sea coal, the latter in all likelihood will be lost for ever. In any case, however, a considerable breadth of coal where it approached the outcrop would necessarily have to be left as a barrier, and it is unquestionable that faults traversing the strata under the sea at a considerable depth and pressure of water, and especially if there are beds of porous sandstone overlying the coal seams, would give facilities for the influx of sea water into the mines so as to prevent or impede the working of the coal. Ventilating shafts to be sunk in the sea have been suggested as practicable by Sir George Elliott—a work we need scarcely add that would be of the greatest interest to the mining world.

WATER FAMINE AT THE EAST.—A dispatch, dated New York, Oct. 27th, says that the moderate rains of the past day or two have brought only partial relief to industries dependant on water power. The drying up of streams in the Atlantic States may be said to extend from the Androscoggin down to the James, and even some of the local rivers, like the Delaware, are fordable at points where such a thing has not been known for many years. The drought, however, is felt more seriously at the eastward, and its effects are beginning to be felt in commercial as well as manufacturing circles. The Boston *Journal* of yesterday says: The scarcity of water is having a had effect upon nearly all kinds of merchandise, restricting the demand, especially for the raw material. Cotton, woolen and paper mills are all running on short time. In Pennsylvania, New Jersey and Delaware, not a few important industries have been brought to a dead halt by the stoppage of the mills. The Passaic and Raritan are unprecedentedly low. The Brandywine is quite dry, and at Wilmington and other places in that part of the country, several establishments have been compelled to shut down.

An old writer in the time of Queen Elizabeth says in regard to mines and speculators: "A mineral man should be a hzard adventnrar, not esteeming much whathar he hit or miss. If he happen to win he must esteem it as nothing; if he losses all yet he must think he has got something." (No doubt the old gentleman meant "experience.") "If he find a rich vein let him not esteem it, for it is like a man etung with a nettle." (Itching for more, of course.) Another writer of the same era says: "When mines hit it is the best got gear in the world, it is so profitabla to all and hurts none; and when they hit not, although it be lost for a time, God is hereby honored in searching his hidden treasures out of the depths of the earth."

BARCELONA BULLION.—Twenty-three tons of Barcelona ore were worked in Eureka and Austin produced bullion valued at \$8,504, the average assay per ton being \$363 in silver and \$20 in gold. The Barcelona mine will undoubtedly develop into one of the finest properties in the State and its shareholders can expect dividends as soon as reduction works are put up. There are immensa amounts of high-grade ore in sight which guarantees bullion shipments for years to come. There are several other mines adjoining the Barcelona that will certainly be worked before long as they all have excellent prospects.

THE total population of the world is 1,459,920,500; of this number 838,704,000 are in Asia.

Working Test by Lixiviation.

We make the following extract on the above interesting subject, from a forthcoming work on lixiviation of gold and silver ores by C. H. Aaron. The generator and wash bottle are made of two wide-necked bottles, jars, or flasks, with corks, and some glass tubes. The corks should be soaked in melted paraffine, and the S tube is enlarged at the upper end, so as to form a small funnel, into which to pour the acid. If preferred, a glass generator and two-necked wash bottle can be bought of J. Caire, or J. Tynlor in San Francisco.

A chlorinating vat is made of a common wooden pail, or small tub, in the bottom of which, near the side, a hole is bored and a cork inserted. Through the cork is passed a piece of $\frac{1}{2}$ -inch glass tube 4 inches long. The cork and tube must not project above the bottom of the pail inside. A wooden cover is made to fit into the pail $\frac{1}{2}$ inch below the rim, and in it is a hole, fitted with a cork and tube similar to those in the bottom. The pail, while dry, is thoroughly coated inside with melted paraffine, which is caned to soak into the wood a little by the aid of heat. A filter is made in the vat by means of a layer of pebbles, covered with a piece of moistened grain sack, or similar material.

A weighed quantity, from 10 to 20 lbs. of the pulverized ore, or concentrations, is dand roasted or chloridized, in a small reverberatory furnace with the precautions indicated under "Special Directions." When cooled, it is slightly moistened and thrown on the filter in the vat. A space of not less than $\frac{1}{2}$ inch must be left between the surface of the ore and the cover, which is now placed, and luted with dough, or with a paste made from a mixture of equal parts of flour and paris plaster, which will not crack in drying.

Chlorine is generated from manganese and hydrochloric acid, the latter being more convenient for small operations than the sulphuric acid and salt used on the large scale. Three ounces of manganese are put into the generator, moistened with water and warmed on a sand bath resting on a small coal-oil stove. The acid is gradually added by means of the S tube. The exit tube of the generator is connected with the wash bottle, and that with the glass tube in the bottom of the vat by rubber tubing.

When a glass rod, dipped in ammonia and held to the tube in the cover of the vat, causes the formation of dense fumes, indicating the escape of chlorine, the surplus gas is conveyed out of the room by a rubber tube connected with the tube in the cover.

The chlorine is allowed to pass through the ore for an hour, more acid being poured into the generator, when required, to maintain the evolution of gas. The waste pipe is then closed by a pinchcock. The wash bottle is disconnected from the generator, but not from the vat, unless it is required for another operation, in which case the glass tube in the bottom of the vat is effectually, and conveniently closed, by immersing its lower end in melted stearin, paraffine or tallow contained in a small cup (dry cup), which is then allowed to congeal.

After the lapse of from 20 to 40 hours, as may be required, the cover is removed. A rubber tube, connected with the glass tubes in the bottom of the vat, is arranged to deliver into a glass, or porcelain vessel capable of containing about a gallon, and is closed by a pinchcock.

Water is now sprinkled on the ore, and when the latter has settled, more water is poured in until it is covered. After half an hour the pinchcock on the discharge pipe is adjusted, so as to allow the lixivium to flow in a slow stream, water being poured upon the ore from time to time to keep it covered. The leaching is continued until a sample of the lixivium, received in a test tube, no longer gives the slightest precipitate on addition of solution of iron sulphate. A more delicate test is that with tin protochloride, which, with the slightest trace of gold in the lixivium, gives a purple coloration.

The gold is precipitated by adding to the lixivium a strong solution of iron protosulphate, which is thoroughly mixed by stirring with a glass rod. To ascertain if enough of the iron sulphate to precipitate the whole of the gold has been used, a drop of the liquid is transferred, by means of the glass rod, to a porcelain dish, or a saucer, and is brought into contact with a drop of solution of potassium ferrid cyanide, or "red prussiate of potash." If an intense blue coloration if not produced, more iron sulphate is required.

The gold requires 12 hours to settle, after which the greater part of the clear liquid may be removed by means of one of the rubber tubes, applied as a siphon. The remainder, with the gold is thrown on a paper filter, or the whole of the liquid may be passed through the filter, to insure the collection of every particle of the metal.

The side, and bottom of the vessel in which the precipitation was effected, and the glass rod with which the stirring was performed, are carefully wiped with pieces of filter paper, held in the forceps, to remove adhering gold, and the paper is added to the gold on the filter. The filter, with the metal is dried in the funnel, and is then placed in an assay crucible, together with an ounce or more of litharge, and a little borax, and smelted. The filter reduces a sufficient quantity of litharge to metallic lead, for the collection of the gold, which is then separated

ated by cupellation, weighed, and the result compared with the assay of the ore.

If the ore contains silver, the gold on the filter may be washed, first with water, and then with ammonia, before being dried, to remove any silver chloride which may be mingled with it, or the bend may be inactivated, and parted in the usual way. After the extraction of the gold, the ore, which in this case should have been roasted with salt, is leached with hypo for silver, as long as a precipitate is produced, by the addition of a drop of calcium-hypsulphite, to a sample of the lixivium received in a test tube.

The silver is then precipitated with calcium sulphide, as in the large way, except that as it is not necessary to preserve the hypo, an excess of the sulphide is used, so that not a trace of the metal may be lost. The precipitate is coagulated by heating on a sandbath, separated from the liquid by filtration, dried and dressed on the filter with litharge and horax, then fused in a crucible with the addition of a little niter, to prevent the production of too much lead by the action of the sulphur on litharge. The lead button obtained is cupelled, and the resulting silver bead, after weighing, should be subjected to parting, as it may contain a little gold. The tailings are dried and weighed. The loss of weight found to have been sustained by the ore in the working, is reduced to percentage. An assay of the tailings is then made, and from the result the same percentage is deducted. The remainder is the loss per ton of ore, by insolubility. This is added to the amount per ton extracted, and the sum deducted from the assay value of the original ore. The remainder is the loss per ton by volatilization, dusting and other causes.

ROAD LOCOMOTIVE.—While taking a consti-

APPARATUS FOR CLEANING QUICKSILVER.

tutional (walk, not dram) yesterday morning, our attention was attracted by a singular looking engine placed in position on the Ophir claim, and prepared to do good service in hoisting ore and water from the incline. Drawing nearer and subjecting the nondescript to a close examination, we were not a little surprised in discovering a very compactly built road locomotive, a machine constructed for the purpose of hauling ore to the mill, but which it is the intention of the owner to employ as a hoisting engine during the fall and winter. It consists of a locomotive engine placed in the middle of a very strong framework of timber, the whole being supported by two large driving-wheels, about five ft. in diameter each, placed one on each side in front, and a smaller guide wheel centrally located behind. This, the first road locomotive constructed in Montana, was built by Mr. J. F. Allen, formerly proprietor of the Butte foundry. He estimates its hauling capacity at 20 tons on a level road. The Ophir, owned by John Noyes & Co., is worked under lease by Mr. Allen. It is a well-defined vein, dipping south, and quite wet at the depth of 20 ft. Rich hauls are taken from the incline ranging from 30 to 300 oz. silver per ton, and to judge from the slight depth yet reached, the ore promises to improve as the incline goes down.—*Butte (Montana) Times.*

A VERY slight declivity suffices to give the running motion to water. Three inches per mile in a smooth, straight channel gives a velocity of about three miles an hour. The Ganges, which gathers the waters of the Himalaya mountains, the loftiest in the world, is, at 180 miles from its mouth, only 800 ft. above the level of the sea; and to fall these 800 ft. in the long course of the water, requires more than a month.

THE Belmont mill will soon be put in order and started on the ore now on the dump, aggregating nearly 3,000 tons, including about 400 tons of first-class rock.

Cleaning Quicksilver.

Of course the best way to clean quicksilver is to retort it, but it is not always convenient to do that unless all the appliances are at hand. The bulk of foreign matter may be removed by other means, however.

A convenient device is a long glass tube into which mercury is poured through a paper funnel, the funnel having a pin hole at the bottom and serving to retain the dirt and dust. The tube may be filled with dilute nitric acid, and be provided with a stop-cock below; or with a bent tube so that a short column of mercury may balance a long column of acid.

An ordinary filter in a funnel, with a hole in the bottom of the filter, will remove a good deal of impure foreign matter from mercury.

Another method is to place the mercury in a basin and force nothing but cold or warm water through it from below, and any grease or foreign matter is carried off. If one has not steam power, etc., water may be led in pipes with the proper fall. The basin has a cock and valve to draw off the clean mercury. Care must be exercised not to force the water too violent so as to cut up the quicksilver too much, and so carry off finely divided particles.

A little dilute nitric acid should be kept on the surface of the mercury in its receptacle.

Another very good means of purifying quicksilver was recommended some years ago by Prof. Leids, of the Stevens' Institute of Technology. We have previously described the apparatus, which is shown in the accompanying engraving. It consists of a glass funnel, A, capa-

ble of holding five or ten lbs. of mercury, the tube of which is cut off at a point just below the stopper of the bottle, B. Cotton wool is jammed into the tube until it fills up the neck, and bulges out the bottom of the funnel. A short glass tube bent at right angles passes likewise through the india rubber stopper of the bottle, and is connected with a water air-pump. The bottle is two-thirds filled with dilute nitric acid (one part of acid and four or five parts of water). The impure mercury is poured into the funnel, A, is drawn through the cotton plug in a multitude of streams, and passes as a fine rain through the acid below. The foreign metals, if not in too large quantities, are removed by solution in the acid, and the pure mercury collects below. It is then run off through the stop cock into a second funnel, C, and after being thoroughly dried by suction through another plug of cotton wool, it is caught and preserved in the bottle, D. A short time suffices for the almost automatic purification of a large quantity of mercury.

THE Eberhardt and Aurora tunnel, at White Pine, was finished a few days ago. It is 6,200 ft. long. It has taken about four years to complete this big job, and it is spoken of as a first-class piece of work. They will commence to crosscut as soon as the upraise connects the tunnel with the incline, and a good circulation of air is ensured.

ONE day last week, says the Oroville Mercury, the head dam of the Forbestown ditch caught fire and was destroyed. The dam is situated on Lost creek, Plumas county, 75 ft. in height and backs the water up for nearly three miles. It was two years in building and cost \$60,000. It caught from fire raging in the woods.

TAYLOR'S foundry at Grass Valley was partially burned Tuesday night of last week. The fire, which originated in the pattern room, was doubtless started by an incendiary, who first cut to pieces the hose on the premises.

On the Primary Structure of Insects.

(Read at the meeting of the Arthrozoic Club, San Francisco, on Wednesday, Oct. 27th, by Dr. H. Baus.)

The only animals that possess real organs for flight are insects. The bird's wings are but modifications of the anterior pair of feet.

This circumstance shows clearly that the wings of the insect cannot be modified feet; it is a proof that their origin is entirely different from that of the bird's wing, because the same organ cannot exist at the same time in its original form and in a modification.

To trace up the origin of the insect's wing, we have to retrace our steps to the lower type of arthrozoa and its repetition in the larva and chrysalis state of the typical insect.

We all know that the body of the arthrozoic animal, be it worm, myriopode, arachnid or insect, is a compound of segments, linked together pretty much like the vertebral column of higher animals, only that the arthrozoic column, forming an external skeleton, includes and protects all the viscera, which, in the vertebrate animals, are included in a second cavity. In this case it is especially the respiratory apparatus that interests us. There is no common entrance into this apparatus like the tracheae of higher animals. Each joint of the many jointed animal has on each side its private entrance, called spiracles, which leads into a system of tubes called tracheae, and ladder-like extensions called air sacs.

These tubes and bladder-like expansions connect amongst each other, in different ways, and form a system of air-conducting vessels, diminishing in size in proportion as they branch off, and embracing with their last dendritic ramifications, the last ramifications of the vascular system.

There is a certain analogy in this arrangement with the respiratory organs of vertebrates, but a vast deal of difference arises from the circumstance that in the vertebrate animal the respiratory organ occupies only a part of the animal, when in the insect it pervades the whole animal.

The more we advance from the homogeneous form of the worm and the myriopode to the differentiated form of the crustaceae, drachnide and insects, the more we observe a tendency of the single organs to come to definite members and lawfully fixed position.

The typical crustacean and drachnide consolidate the anterior segments into the form of the cephalothorax, developing in the higher crustacean the number 10; in the drachnide the number 8.

In the insect the cephalothorax of the previous group separates into head and thorax; the latter in the coleoptera even separating the prothorax from the middle and posterior segment in the shape of what is called neck (collum).

The number of feet in the perfect insect is always six, a pair for each segment of the three joints of the thorax. In the typical insect two pairs of wings are added, always inserted in the middle and posterior segment of the thorax.

It is not a mere coincidence that these two consolidated segments never possess spiracles, so far as I know.

The wings are a modification of the respiratory organs of the insects, no more serving for respiration, but for locomotion. The point of insertion is the spiracle; the nervulation of the wing is the system of air tubes, or tracheae; the double membrane expanded between them is an air bladder flattened out into a plane.

Agassiz, in a most interesting treatise, has directed the attention of entomologists to the fact, that the transformation of the metabolite insect, repeat, in their worm-like larva, the myriopode; they imitate by the cephalothorax of the chrysalis, the crustacean and the drachnide.

Now the larva possesses the two spiracles on each segment. In the chrysalis the cephalothorax has no spiracles; but in the winged classes, even in this imperfect state, abdominal air bladders begin to form, perhaps to vicariate by their expansion for the tracheae and spiracles of the meso and metathorax, where activity is no more a respiratory one. I have not yet found an exception to this arrangement, but it is possible that the law does not exist in the same purity in the ametabolous groups.

THE Original Empire mine, of Grass Valley, one of the earliest quartz mines opened in this State, has again resumed production. It was closed down some time ago on account of water and other difficulties, but after passing into new hands the water was pumped out and the quartz found to be as plentiful and productive as ever.

THE Vandewater mining company, in Spring Valley, shipped to New York recently 500 lbs. of Stedefeldite ore, which assays from \$2,000 to \$6,000 per ton. This ore runs in streaks from two to four inches wide in the Eagle mine, owned by the Vandewater company.—*Silver State.*

THE Manhattan mill, in Austin, last week reduced 135 tons of ore, and produced \$42,865.87 in bullion.

THE shipments of bullion from Silver Reef for the month of October aggregated \$102,621.32.

TOTAL bullion shipment from the Stormont mine for October, \$52,698.

The University Mine.

Mr. D. F. Moore, Superintendent of the University mine (Bodie), has presented the following annual report:

To the President and Directors of the University Gold Mining Company—GENTLEMEN: The following is my report of the work done and the developments made in the University mine for the year ending Oct. 27, 1880, together with its present condition and prospects: At date of last annual report (Oct. 27, 1879) our new three-compartment shaft had been sunk to a depth of 164 ft. from surface. Sinking was continued uninterruptedly till a depth of 510 ft. was attained; here a station was opened, and cross-cuts northeast and west were run with the following results: To west crosscut, 92 ft. from shaft, we cut into a ledge formation five ft. in width, which, though carrying some fine ore, was badly broken up and did not deem it advisable to prospect it, as from its dip it would be carried into the shaft at a greater depth. This crosscut has been run a distance of 112 ft.; in northeast crosscut at 100 ft. from shaft, a solid ledge two and a half ft. in width was cut, but, as to reach our main ledge was our principal aim, we did not drift on it. Wishing to attain a depth of 700 ft. as speedily as possible, and still have stations opened at convenient places, I suspended work on this level and resumed sinking. When a depth of 610 ft. was reached, a strong flow of water compelled us to stop, and here another station was opened and a crosscut started west; at 14 ft. from shaft another new ledge 18 inches wide was passed through. We run this crosscut a total distance of 55 ft., water then disappearing from shaft we again resumed sinking, until a depth of 665 ft. was reached. Here our third station was opened, and then continued the shaft to a further depth of 25 ft., when water again interposed with our operations. Work was then for a time confined to 665 level, an east crosscut was run 124 ft., also a west crosscut 56 ft. from shaft, neither of which was run far enough to intersect any of our ledges. In order to reach our main ledge as speedily as possible, resumed work in northeast crosscut 510 level, that being the farthest advanced in that direction, and in which we are now in a distance of 223 ft., and are in daily expectation of cutting the ledge. The formation in lower level indicates that our ledges when cut at that depth will be principally silver bearing. To summarize our work for the year, we have sunk and timbered our shaft 526 ft. (making a total depth of 690 ft. from surface), have opened three stations, run 570 ft. of drifts, discovered and recorded two new ledges. Our property now consists of a mining claim 1,500 ft. in length by 400 ft. in width (and though as yet but little prospected), shows five well defined ledges, and adjoining one of the most valuable mines in the district—No. 24. Hoisting works, which for strength and durability are unsurpassed by any here erected; machinery of the newest and most approved pattern, working to our entire satisfaction, and now having done all our dead work, we are fully and amply prepared to open up and develop our mine. With all these facilities coupled with present indications, I am firmly of the opinion that in a short time the University will prove one of the most valuable mines of this district. All of which is most respectfully submitted.

RED MOUNTAIN.—A correspondent of the Monitor Argus, Alpine county, says: The last find is in Red mountain, on the west side of Hope valley, at an altitude of over 1,000 ft. above the valley. The mountain runs north and south, and the ledges run a little east and west of that line. They are large and well defined. Three ledges, called respectively New York, Boston and California Comstock. The find is called the "Wonder," and is located on the California Comstock, north of Crater lake where a break has occurred, crossing two of those ledges. The lake is of great depth, never having been fathomed. It is nearly round and about 40 rods in diameter. A small stream of water coursing down the Wonder has cut a part of it down 40 or 50 ft., leaving nearly perpendicular sides. At this season of the year the snow is nearly all melted, so there is but little water running, and you can get into the bottom of the cut, where, if you will take your hand and throw water upon the wall of rock on the other side of you, I think you will exclaim, "What a wonder!" for wherever the wall is washed by the water, the sparkling mineral is plainly to be seen. There are thousands of tons of rock here exposed that will pay handsomely to work for gold and silver. I broke a piece of rock weighing several pounds from the ledge over three weeks ago, that will assay over \$1,000 to the ton, free gold, saying nothing of what is contained in the sulphurets. In an adjacent ledge the ore contains gold, silver, copper and nickel—silver from \$20 to \$50 per ton, and copper from 20% to 75%. In fact we get some native copper, and different combinations of copper, viz., the double sulphide, red, black and gray oxide; blue and gray carbonate and gray malachite.

A CLOSE CALL.—A six-horse team loaded with giant powder, and driven by "Happy Bill," yesterday went off the Sugar Loaf grade into the river. The wagon was overturned and the powder was dumped about, right and left, and the wonder is that "Happy Bill" was not made unhappy, and in another world to-day singing the songs that would suit the occasion.—Ne-

A Card from Architects.
The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerns, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Currier, Meeker & Banks, W. C. Hoagland, S. & J. Newson, B. Hennickson

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorinating Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 500 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

GOLD SAVING

SILVER PLATED

Amalgamating Plates,

FOR QUARTZ MILLS AND GRAVEL CLAIMS.

**Scientific and Practical Books
on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$3.00 coin, postage free.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small band, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, sawing, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 56 inches, lists of all U. S. Patents on Saws from 1750 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made \$2.50, postage paid.

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia

March 10 1880.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and success of working of numerous machines in operation in the quartz and gravel mines on the coast. Circulars forwarded, and full information given upon application.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Campbell vs. James, et al.

U. S. Circuit Court, Southern District of New York.

Decided April term, A. D., 1879. Wheeler, J.

1. The re-issued Letters Patent, No. 4,143 (Division A), granted to Helen M. Ingalls, October 4, 1870, for an improvement in post-marking and canceling stamps, the original patent having been granted to Marcus F. Norton, April 14, 1869, and re-issued to Jacob Shavorani A. C. Corse, August 23, 1864, and re-issued to M. P. Norton August 3, 1869, declared valid.

2. The judgment of the Commissioners of Patents discharging a solicitor for surreptitiously placing a copy of a caveat in the official files extends only to the exclusion of the solicitor, and not to the effect of the paper as evidence *in pais*, although its effect upon the instrument as a caveat of record might be greater.

3. Where a document is introduced in evidence by a defendant to prove admissions by the inventor inconsistent with his claim, such document is legitimate evidence according to what should appear its just weight, as well as to those facts in favor of the inventor as to such as are against him.

4. Although the weight of evidence might be in the defendant's favor if the question as to prior use of the invention were to be determined upon a fair balance of proof and upon the oral evidence alone, still, in order to defeat the patent by showing an invention prior to a clearly established one of the patentee, it must be as clearly established to the extent, at least, of removing all fair and reasonable doubts.

5. By provisions of the Act of 1836, section 15, it was only public use or sale with the consent and allowance of a patentee before the application for a patent that would defeat the patent. The Act of 1839, section 7, did not change the character of the public use or sale that would defeat a patent, but provided that no patent should be held invalid by reason of them unless "such purchase, sale, or prior use has been for more than two years prior to such application for patent."

6. The defense of public use, for more than two years prior to the filing of the application upon which the patent was granted must be clearly proven. A private use for testing the invention, and informing the inventor as to its perfection and usefulness, with the design on his part all the while to procure a patent, will not sustain such defense.

7. If the re-issues of an original patent are for any other or substantially different invention from that described in such original patent, they are unquestionably void; but the fact that the specifications or claims are, in substance, the invention or discovery remaining the same, is of no consequence.

8. If a form of a device, embraced in a re-issued patent had not been mentioned in the original patent, it might well be said not to have formed any part of the conception of the inventor; but if described in such original patent, although referred to as not being so useful or desirable in the combination as another form of such device, it might, nevertheless, be properly embraced by the re-issued patent.

9. It is doubtless true that a re-issue to a person not the owner would not affect the title of the owner. The re-issue and title should go together to make a good title to the re-issue, or at least the re-issue should be consented to by the true owner.

10. The defense that the plaintiff's title fails because one of the parties through whom such title is derived did not own the patent when it was surrendered by and re-issued to him, was sought to be sustained by showing that a certain instrument of writing was forged by such party by placing it before and attaching it to the genuine execution of another and different instrument. It appearing that the parties whose assignment such instrument purported to be, had knowingly acted upon the same; *Held*, that this ratified and confirmed the instrument as good from the beginning.

11. A conveyance executed by the signature of a company with seal, and by S., president, and another seal, is a good execution, both for the company and for S. individually.

12. It appearing that the conveyance was one expressly in trust, upon condition that the plaintiff should have the sole management of the trust until a fair, just and reasonable settlement should be had with the United States for the use of the invention in the postal service of the United States by the post-office department; *Held*, that as no such settlement had been made, the limitation in the conveyance had not expired, and the right to bring suit for infringement was in plaintiff.

13. The grant of letters patent for an invention is exclusive throughout the United States, and reserves no right to the government to use the same.

A decree entered that the patent is valid, that the de-

fendant has infringed it, and for an account of profits and damages, with costs.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

News in Brief.

TORNADO in Utica, N. Y., on Saturday. HEAVY gales have caused disasters on the great lakes.

THE fast Australian mail was detained 12 hours at Queenstown.

NEARLY 1,000 houses have been erected in Denver during the year.

PRINCE GORTSCHAKOFF is very ill, and it is not likely he will recover.

THE Socialists ejected from Hamburg will come to the United States.

A POWDER magazine in Lacrosse, Wis., was exploded Monday by shots fired into it.

THERE is a great scarcity of bread in Russia, in spite of American importations of wheat.

FROM 200 to 300 miners at Akron, Ohio, have struck, demanding an advance of 10 cents per ton.

THE Porte is making tremendous efforts to be in position to effectually close the Dardanelles at short notice.

THE expelled French monks are receiving a cordial welcome in Spain, where all classes vie in tendering them hospitality.

considered all further pleadings needless in a country where the motto of a government is: "Might is right."

MEXICAN papers demand that the United States shall help pay the reward of \$2,000 for Victorio and \$22 for each Apache killed, as well as aid in relieving the want caused by the raid.

It will cost the cotton planters about \$40,000,000 to market their crop this year, of which \$25,000,000 will go into the pockets of colored laborers, many of whom are women and children.

It is reported that Queen Victoria has asked Gladstone to propose to Parliament a grant of £40,000 to enable the Prince of Wales to pay his most pressing debts, and that the Premier has declined.

A RUMOR was widely published in the New York dailies that Chinese labor is being introduced in silk and other mills of Patterson, N. J., and is met with an indignant denial by the manufacturers.

THE New York *Telegram* has the following Washington special: The reported loss of Bennett's Arctic exploring steamer *Jeannette*, with all on board, telegraphed from San Francisco, is doubted here.

EDDIE J. Cahill, aged eight years, was accidentally shot and killed by his 11-year-old brother, at San Leandro, Sunday. The latter took up the gun to snap a cap at his brother

The Clayton Air Compressor.

(CONTINUED FROM PAGE 305.)

of the piston at a given rate of speed is treated in the same manner as the steam pressure is treated in the ordinary steam engine card in propelling the piston forward at a given velocity.

The merits of any diagram taken from an air-cylinder should be judged according as the compression-line following the hyperbolic curve, which represents an increase of pressure at a constant temperature. An approximation to the curve can be obtained only by the absorption of the heat as rapidly as it is rendered sensible by the compression.

For convenience, the hyperbolic curve is shown on all the diagrams accompanying this article, which were taken from a duplex and double-acting Clayton air compressor (same as illustrated) having steam and air-cylinders of equal diameter and stroke, while delivering the air into a receiver, the safety-valve of which was set at 45 lbs. pressure. Consequently the resistance was uniform during the trial. The speed also was the same (53 revolutions per minute), excepting when No. 1 was taken.

The speed in this case was increased from 53 to 65 revolutions per minute, in order to determine the limit to which the speed of the air-piston could be increased and still the cylinder

be filled with air of normal density before reaching the end of the stroke, when compression commences, without changing the proportion of "inlet valve" opening to area of piston, which is adopted in constructing these compressors.

Card No. 1 was taken from the air-cylinder when supplied with water for lubricating the interior surfaces and also filling the "clearance" spaces. Water was supplied the exterior jacket, and the "tripping device" adjusted to act at the proper time in opening the delivery valves. The diagram shows that at the speed the compressor was moving, the action of those parts which could directly influence the action of the indicator was almost perfect. From the point at which "induction" ceased and compression commenced, the pencil followed the "hyperbolic," or curve of constant temperature.

Card No. 2 shows that without the "tripping device," the pressure is raised before it lifts the discharge valve from 46 to 62 lbs., the water running in the cylinder, as in card No. 1, but not in the water jacket, and shows how the air is heated and expanded in advance of its full pressure.

Card No. 3 shows the suction valves lifted automatically, but a heavy loss is occasioned by absence of water from the cylinder, as the compressed air not discharged at the end of the stroke followed the piston back about one-fifth of its stroke. Card No. 4 is taken from the cylinder without water in the jacket or in the cylinder, and with the discharge valves lifted without the assistance of the toes. This shows a heavy loss of power through the air becoming heated, consequent on entering into a hot cylinder, a great loss in compressed air expanding back in the cylinder and occupying the space which should be filled by fresh air, and an immense waste of power in the power required to lift the valves; viz., from 45 lbs., the working or receiver pressure—to 67 lbs., the pressure at which the valves lifted. This card is probably a fair average of the result which would be obtained by "indicating" the air cylinders of some of the imperfect compressors at present in use. It is self evident that a compressor producing such a card would in a very short period consume an amount of fuel—in proportion to the percentage of effective working power in the shape of compressed air given—the cost of which would equal the price of a new compressor of improved construction.

Card No. 5 was taken from the "steam cylinder" of one of these compressors, and shows the degree of economy attained to in its consumption of steam. The compressor was running at 90 revolutions per minute, with a boiler pressure of 70 lbs., cutting off steam at 52% of the stroke, and giving an air receiver pressure of 100 lbs. Taken as a whole, the Clayton air compressor seems to be as nearly automatic in its action as it well can be, showing that its details have been carefully studied by the designer, and the large sales reported attest the general excellence of materials and workmanship. Farther information can be had of the Clayton Steam Pump Works, 14 and 16 Water St., Brooklyn, N. Y.

INDICATOR CARDS FROM CLAYTON AIR COMPRESSOR.

GEN. BENET, Chief of Ordnance, in his annual report calls attention to the necessity for a new machine shop at the Benicia arsenal.

It is stated that Gen. Grant prefers the Secretaryship of War to the Illinois Senatorship, and will probably be offered that position.

GREECE is getting ready. The Minister of Finance has asked for an extraordinary credit of 36,000,000 drachmas for the War Ministry.

CHINAMEN, to the number of 562 left this city by the last steamer for China. Lack of employment is the reason given for their departure.

THE Shah of Persia has appealed to Russia for help against the Kurds. The government has consented to give help under certain limitations.

ENGLAND, at the instance of Persia, has requested the Porte to station a guard on the frontier, in order to prevent incursions of Kurds into Persia.

UNDER the California law no more deer can be killed from November 1st until next July. Trout cannot be caught between October 15th and April 1st.

CAPTAIN EADS will soon sail from New Orleans to Mexico with a party of engineers to examine the Isthmus of Tehuantepec in order to verify his idea that it is suitable for a ship railway.

BEFORE the Tribunal of Conflicts, in Paris on the 5th, Boviel, of counsel for the Jesuits, declared that in view of the expulsion of 11 religious congregations in Paris on that day, he

thinking the gun was empty. It was, however, loaded.

THE Board of Trade returns for October show a decrease of £4,881,000 in value of imports into the United Kingdom, and an increase of £978,000 in value of exports, compared with the same month last year.

THE French Cabinet discussed on Saturday the declaration to be made at the opening of the chambers. The programme is expected to be a reorganized Ministry, reform of the laws relative to the press, and the right interpretation of the education laws.

DR. TANNER is making arrangements to fast 40 days in London. He says the advocates of alcohol may select six men as near his age and physical condition as possible, who can take wine, beer or any spirituous liquor, during the fast, and he will take water only.

THE stage from Georgetown to Auhurn, Placer county, on Monday, was stopped about a mile and a quarter from Auhurn station by a masked man armed with a Winchester rifle. He took Wells, Fargo & Co.'s box, containing \$2,159.30 in coin and \$285 in gold dust.

THERE was a terrific wind storm at Montreal on Sunday. A three-story house on St. Mary's street, occupied by a wholesale and retail grocer, was blown down. Damage to stock heavy. The clipper ship *Ravenrag* was blown on her beam ends at the wharf, but was afterward righted.

Quinine and Aconite

Form the basis of many of the Acute Remedies in the market, and are the last resort of physicians and people who know no better medicine to employ for this distressing complaint. The effects of either of these drugs are destructive to the system, producing headache, intestinal disorders, vertigo, dizziness, ringing in the ears, and depression of the constitutional health. AYER'S ACUTE CURE is a vegetable discovery, containing neither quinine, arsenic, nor any deleterious ingredient, and is an infallible and rapid cure for every form of Fever and Ague. Its effects are permanent, certain, and no injury can result from its use. Besides being a positive cure for Fever and ague in all its forms, it is also a superior remedy for Liver Complaints. It is an excellent tonic and preventive as well as cure, of all complaints peculiar to malarious, marshy and miasmatic districts. By direct action on the liver and biliary apparatus, it stimulates the system to a vigorous, healthy condition.

THE CALIFORNIA PUBLISHING CO.

(P. O. Box 2319) 202 Sansome St. S. F.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving additions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOOKS VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company,

San Francisco, November 3d, 1880.—At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 11) of Twenty-five (25) Cents per share was declared, payable on MONDAY, November Fifteenth (15), 1880, at the office of the Company, Room 19, No. 323 Montgomery Street, San Francisco, Cal. Transfer books will be closed from Thursday, November Eleventh (11), 1880, until Tuesday, November Sixteenth (16), 1880.

JOSEPH NASH, Sec'y.

DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill and Mining Company,

SAN FRANCISCO, CAL., NOVEMBER 10, 1880.

At a meeting of the Board of Directors of the above named Company held this day, Dividend No. 37, of Fifty cents (50c.) per share, was declared, payable on Monday, November Fifteenth (15th), 1880. Transfer books closed on Thursday, November Eleventh (11th), 1880, at three o'clock, P. M.

WM. WILLIS, Sec'y.

Office—Room No. 29 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

Office of the Standard Consolidated Mining Co. San Francisco, November 1, 1880.—At a meeting of the Board of Directors of the above named Company, held this day, Dividend No. 21, of Seventy-five (75) cents per share, was declared, payable on Friday, November Twelfth (12), 1880, at the office in this city, or at the agency of the Nevada Bank of San Francisco in New York. WM. WILLIS, Sec'y.
Office—Room No. 29 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

Lewis Consolidated Silver Mining Company.—Location of principal place of business, San Francisco. Location of works, Pioneer Mining District, Placer County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Second (2d) day of October, 1880, an assessment, No. Three (3), of Ten (10) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 15, No. 310 Pine Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the First (1st) day of December, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the (20th) Twentieth day of December, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
J. W. PEW, Secretary.
Office—No. 310 Pine Street, Room 15, San Francisco, Cal.

Land Purchasers Association.—Location

of place of business, San Francisco, California. Notice is hereby given that at a meeting of the Directors, held on the Ninth (9) day of November, 1880, an assessment of Five Dollars (\$5.00) per share (being a part of the 4th installment on the subscription to the stock), was levied upon the capital stock of this Association, payable immediately to the Secretary, at 318 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid, on Friday, the Tenth (10) day of December, 1880, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
C. S. WRIGHT, Sec'y.
N. B.—This assessment is to pay the taxes on the property of the Association for the current year.

By a young man who thoroughly understands assaying all kinds of ores. A graduate of Kustel & Riette, to whom he refers. Address his father,

F. HOFLING, Jeweler,

No. 5 Third St., S. F.

This paper is printed with Ink furnished by Chas. Ensu Johnson & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorey, 527 Commercial St., S. F.

DEWEY & CO.,

American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N. E. COR. FINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Small Sizes made in Sections not to Exceed 300 lbs.

FRUE'S ORE CONCENTRATOR OR VANNER.
Plunger Jigs. Revolving Screens.
CRUSHING ROLLERS. SAMPLE GRINDERS.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either on ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining mills can see the Pan in operation by calling at the **OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.**

Railroads and Progress.

The growth and advancement of the United States is in no other way brought home to our English cousins as in the increase of railroad facilities. They send us thousands of tons of rails, and when they see the combined rail mills of America and Great Britain unable to keep up the supply, they know we are growing. The award of a contract, on American account, to the world-famed Krupp, of Essen, for 25,000 tons of steel rails, opens their eyes still further, and the award of this contract has drawn out many comments from English sources. As contractors find it difficult to procure early deliveries of rails of American manufacturers, they are compelled to resort to the rail mills of Great Britain, Belgium and Germany.

These facts stand, moreover, as proofs that our revival of business is not due to speculative or transient causes. Railroads are being built in every direction. The great West is being opened, settled, civilized and expanded. The locomotive is moving into every corner of the land. The prodigious increase which is constantly taking place in the United States by births within this country, and by accession from foreign sources, ensures a continuance of this progress, and exercises a marvelous influence on the whole country. New sections must be opened up and settled. New towns and villages will spring up, new railroads will be built and new resources be developed. The Eastern States are already well filled up, and this overflow of population must come into the great West where there is land and room for all.

The railroads must keep up with, if not ahead of this march of progress. To do this, they must be rapidly extended. Railroad building has become a science with us. We don't pretend to build with the solidity or permanence of the European road, but we build rapidly and overcome obstacles which would elsewhere be considered insurmountable. Moreover we have very long lines under single managements. This is of course only possible in a big country like this. As an example, we may cite the Central Pacific railroad, the report for which, for the year ending December 31, 1879, has recently been issued. This company worked, during the year, an average of 2,318.92 miles of road, the mileage standing at this close of the year as follows:

Main line, San Francisco to Ogden, miles.....	833.23
Oregon branch, Roseville to Redding.....	157.60
Visalia branch, Lathrop to Goshen.....	146.08
Oakland and Alameda short branches.....	14.68
San Jose branch, Niles to San Jose.....	17.54

Total Central Pacific.....	1,213.13
Northern and San Pablo and Tulare.....	163.65
Berkeley branch.....	3.84
Oakland Pacific.....	115.44
Amador branch.....	27.20
Stockton and Copperopolis.....	49.00
Los Angeles and San Diego.....	27.60
Los Angeles and Independence.....	18.83
Southern Pacific.....	550.25
Southern Pacific of Arizona.....	182.81

Total.....2,349.75

On the Southern Pacific of Arizona above referred to, the passenger trains are now running as far as Lordsburg, which is 407 miles from Fort Yuma, or 220 miles farther than the above table shows. The total number of miles the company has at present in operation is 2,575, and the work of building southeastwardly is still going on vigorously. Up to Sunday, the Southern Pacific railroad track was 8579-100th miles in New Mexico, being that distance east of the Arizona line.

CHEAP MINERS.—It is reported that a number of men were engaged in this city this week for \$1 a day and board, to work in a mine 150 miles from Tucson, Arizona. The fare to Tucson was paid, but deducted from the first month's pay. Thirty-six men were engaged on these terms, they expecting to walk from Tucson to the mine. It is hardly probable that the men will work for such wages very long, even if they get to the mine. It is more than likely they will desert by the time they get to Tucson.

Expenditures on Claims.

The Commissioner of the General Land Office has written a letter to Senator Hill, of Colorado, announcing an important ruling in regard to the present law concerning the annual expenditures on mining claims. This question submitted by Senator Hill, in behalf of one of his constituents, was, in substance, whether the department would recognize, as a compliance

with the act of last January, an expenditure of \$100 worth of work between Oct. 10th and 20th, 1879, upon a mining claim located Oct. 1st, 1879. Commissioner Williamson, in reply, writes as follows: "Under the act of May 10th, 1872 (Sec. 2,324, Revised Statutes), the annual expenditure for improvements was due within each year, commencing with the date of location, except in regard to claims located prior to the enactment of that law, the annual expenditures upon which were made due by Jan. 1st, 1873, and annually thereafter. The purpose of the amendatory law of Jan. 22d, 1880, was to secure a uniform period within which the annual expenditure should be required on all locations, and it provided that such period should commence on the 1st day of January succeeding the date of location of such claim. It therefore follows that a claim treated Oct. 1st, 1879, requires the expenditure of \$100 worth of labor or improvements thereon within the calendar year 1880, and that whatever may have been expended during the year 1879 will not answer the requirements of expenditures in 1880. It also appears, by reason of the change made in the requirements of the act of May, 1872, amendatory of the law of last January, that a claim located on any date subsequent to the 1st day of January, 1879, requires no further expenditure during the remainder of that year than is made necessary by local laws." The Commissioner adds that he finds he has inadvertently signed a letter indicating a different construction of the section aforesaid, but the conclusion now given has been reached after careful consideration, and will control his official action.

SUIT has entered in the Superior Court, Los Angeles, by A. A. Cohn, attorney for the Atlantic and Pacific Railroad Co., against the Southern Pacific Railroad Co., for the recovery of lands in Los Angeles county alleged to be unlawfully held by the defendant, and for rents since August 1st, 1876, amounting to \$250,000.

Mechanical Drawing.

The education of a first-class mechanic is incomplete without a thorough knowledge of mechanical drawing, and other branches inseparably connected with it. An inability to express ideas upon the drawing board is a sad drawback to a mechanic. There are hundreds of machinists who would be, at this moment, poring over their drawing boards, inventing, scheming and

improving, had they studied and acquired a taste for practical drafting. In the workshop, the practical part of a mechanic's business is to be learned. No one can claim to be a practical engineer and draftsman, whose practices did not commence in the workshop. Here he can employ observation, thought and inquiry, make himself acquainted with the mechanical powers, learn the nature and the manipulation of metals; here he can acquire manual skill in working and fitting the various details of steam engines, boilers, tools, machinery generally.

But it must be remembered that the scientific book and the drawing board must go hand in hand with practical experiences. A first-class mechanic ought not to be able only to work practically, but also to design practically; he should be able to express his designs, improvements or inventions upon paper.

We are led to these remarks by the perusal of a little work on "Practical Drafting," by T. P. Pemberton, published by the Industrial Publication Co., N. Y. This little guide contains practical instructions in drafting for machinists, mechanics, apprentices and students. The instructions are in plain, comprehensive terms, such as a teacher would use to his pupils. The author has devoted his attention to this practical rather than to the theoretical part of the subject. The instructions may prove useful to many engineers and mechanics, the illustrations and explanations being simple, plain, and to the point.

THE *Times'* Quebec special says: Mills and considerable quantities of machinery are being shipped to the Beaucegold mines, Canada. A company with \$500,000 capital was organized in Boston in one day, and a New York gentleman paid \$60,000 for 50 acres on Gilbert river.

THE bullion shipments from Silver Reef, through Wells, Fargo & Co., from Oct. 28th, to Nov. 3d inclusive, aggregate the sum of \$20,006. Total shipment for month of October, \$105,411.18.

Alaska Mines.

When Alaska was purchased by the United States it was supposed by many that rich mines existed within its borders. Numerous prospecting expeditions have been organized, but the country has not been very thoroughly prospected. There are some gold quartz mines near Sitka, on which work is at present suspended, but it is said operations will soon be commenced on a large scale.

There are several localities in Alaska where a more thorough prospect may develop something of value. Messrs. Bean, Duncan and other miners, who went through Chiloott to the interior of Alaska and the head waters of the Yukon last summer, returned on the 23d of October. They penetrated about 200 miles into a region of vast plains, interspersed with ranges of low mountains, and rivers connecting numbers of lakes. They are said to have found gold in many places, and the deposits indicated rich placer belts in the mountains from which they came, but the formations did not show with much certainty the direction in which they lay. Much of their time was lost from ignorance of the country and want of correct maps, but they think the knowledge they have now acquired will enable them to find the placer diggings easily next summer, and they intend to try it again. The Yukon is a mighty river. It drains an immense extent of territory which is yet to be explored. The expeditions there this year naturally looked more for placer mines than anything else, rich placers being always the dream of the miner. When they find them they will then look up the quartz. It may be that extensive beds of gravel may be found somewhere about the headwaters of the Yukon. The men who were there this year will go back next spring, with better prospects, their experiences of this year having given them a good knowledge of the country.

A New Vertical Sinking Pump.

We illustrate here with this new Knowles' vertical sinking pump of the bracket plunger pattern. Different sizes of this style are made. A ten-inch cylinder, five-inch plunger with ten-inch stroke weighs 1,000 lbs. This size is six ft. in length and occupies a space in the shaft 22½ by 15 inches.

The dogs shown in the engraving are made to hook on to the shaft timbers and support the pump. The lower dogs are adjustable. The plunger may be got at very easily, by unlocking and moving the casing back on a bolt, which serves as a hinge. This style of pump is a very handy one for sinking, and Messrs. Parke & Lacy, the agents, have now a number of them on the way out here for use in mines in this State.

Z. L. WHITE, formerly the mining correspondent of the *Tribune*, tells the following story which he heard in Colorado: A man living at Colorado Springs was desirous of making a sudden fortune, and employed an old miner to help discover mineral in the mountains about Pike's Peak. When they had their prospect hole all ready, they employed a mining expert to examine and report upon their property. He gave an elaborate description of the geology of the country surrounding the mine, and of the rock in which it was found, but when he came to discuss the origin of the pay ore, he remarked that some veins were charged by sublimation and some by precipitation, but that the ore under discussion was the first he had ever been called upon to examine professionally that bore unmistakable evidence of having been charged with a wheelbarrow.

A LARGE quantity of telegraph wire, says the *Chico Record*, was received at the railroad depot on Monday for the Jackson Mining Co. The new line will be constructed from the Sierra Lumber Co's. mills, near the Sutton house, to the mine on Deer creek, a distance of about 15 miles.

KNOWLES' VERTICAL SINKING PUMP.

The Remedy for the Phylloxera—No. 3.

I pass now from the determination of the injury of the bisulphide of carbon, which was the last subject considered, to this resistance of the vines to the same. The first experiment made with the bisulphide of carbon destroyed the subterranean colonies of phylloxera, but gave discouraging results with respect to the vine itself. M. Cronet, at Sainte-Foy-de-Lognes (Var.), was among the first to apply the bisulphide, pure, with vines 6x2 ft. apart. He injected the substance in the corners of a quadrangle about each vine, placing 5 grams in each of 4 holes 7 inches from the vine. The result is easily guessed—15% of this vines were lost in the operation. The next was M. Guet, at Solliès-Pont (Var.), who destroyed 23% of his vineyard by improper application of the bisulphide. Others made equally bad attempts, and these unfruitful efforts gave rise to much discouragement respecting this insecticide. This experience goes now to show the necessity of determining by accurate scientific experiments the proper method of applying the bisulphide, and then of conforming exactly to the rules deduced from such experiments. The experiments of the *Comité* to determine its effect on the vines were as follows:

On the 24th of June, 1877, 150 infected vines were treated with the bisulphide at the rate of 25.40 grams per sq. meter. Of this number of vines 72 were already badly reduced in strength, 46 a little better and 32 offering still some appearance of vigor. Three days after the injection of the insecticide, and continuing 7 or 8 days, the leaves of the vines most reduced exhibited a yellow appearance; the most vigorous exhibited no sign of the effect of the vapor. By the 12th of July they regained their natural green color and awoke from the influences of the drug. In this lot there were two classes of vines, one of 4 years of age and the other class 40. Now of the older, many of which were almost entirely gone, a few dropped off entirely, being too far gone to be resuscitated at all. Not so with the young ones, they all revived, proving that young vines will stand the bisulphide better than old ones, and that only those vines completely gone have to fear the ordinary dose employed. In very rare cases, when the vineyard is rendered feeble throughout, the bisulphide must be thoroughly distributed and the dose diminished slightly. It is certain that with the ordinary quantity, the proof is terminated as to the continuance of the vine in from 8 to 10 days. Again, a determination was made on an apparently healthy vineyard, but one which was badly infested with phylloxera. A number of rows of vines for this purpose were divided and apportioned for the receiving of different quantities:

Two rows received 26.70 grams per square meter.	
" " " 53.30 " " " "	
" " " 80.00 " " " "	

The application was made on June 23d, and all on the same day.

Of the first two rows, viz.: those to which were applied 26.70 grams per square meter, only one vine was without grapes. Eight days after the injection this weakest one appeared badly withered—the others not even changing the color of their leaves. After 20 days this withered vine came forth with new shoots and leaves, vigorous and well. Of the second two rows, viz.: those receiving 53.30 grams per square meter, the vines had, before the treatment, an irregular appearance—some strong, others more wasted and destitute of grapes, and still others quite bad. Five days after the injection of the bisulphide a pale tint appeared, showing that the leaves were sensibly affected by the bisulphide. One vine, worse than the rest, was sensibly withered. Five others a little stronger appeared quite yellow. Four days after this there continued a striking difference between the weak and strong vines, the strong vines not being distinguishable from those not treated, and the others continuing to suffer; three of them withered completely. In 30 days more these last branched out with a new growth and returned to health and vigor. The last two rows, viz.: those receiving 80 grams per square meter, were, before the application, irregular as the second two rows. Here the yellow color came on rapidly and continued intense throughout for 17 days. Many of the young branches were completely withered and even some of those on the strong stocks. The vines of medium vigor lost many leaves and the grapes dried up. Five of the poorest were, to all effects, completely gone. Twenty-four days after the yellow color had disappeared from the strong ones; on the others it continued 36 days. One of the five which were apparently dead finally put forth new sprouts and leaves.

This seems to be as far as we need go with these experiments, for it will never become necessary to apply so much as 80 grams in a single dose, and we will now see how it affects the leaves when coming into direct contact with them, as when it is to be applied in summer. The barrel of bisulphide placed in the vineyard has been known to kill those vines so situated as to receive the vapors each time the injector is filled. This, when observed, led to the following experiment: When 10 grams are placed in an open hole beneath the green vine, the single phenomenon which appears, is the withering of the few leaves which are in immediate contact with the orifice—this, in the

month of June, when the fumes are most energetic—now, with the orifice closed, as is done in the practical working, the little which comes upward works no injury at all to the vine, being immediately taken off into the open air. The question has arisen: does the carbon bisulphide arrest the functions of the vine only, or does it poison it by absorption? From what precedes, and from experiments directly for this determination, the inevitable conclusion is, that though the vapors be very abundant, they only suspend the absorbing function of the vine, and do not act as poison. This chapter, which ends the experimental work on a small scale, is closed with the following, as translated from the French:

"As a result, we have found that the subterranean diffusion of the vapors of carbon bisulphide are as energetic and effective as we could wish, and, furthermore, the vine is shown to be little susceptible of the influence of the vapor. Finally our experimental determination of the coefficient of the insecticide indicates that the doses or amounts of the re-agent recommended by the *Comité* must in every case, if they are properly applied, bring about the desired mortality of the terrible root grub or phylloxera. It is seen that successive treatments, methodically carried out, with the bisulphide will produce the required results."

To complete the examination of the first part it becomes necessary to note the results of experiments on a large scale. The space here given does not permit of all the details of those experiments, and I will, therefore, confine myself to the most important facts, and must be excused for stating them in a brief manner:

Cap-Pinede, a Marseille.—Here was a vineyard which had been badly infested since 1870, consisting of five acres of 60-year old vines. The roots of the vines were mostly withered and dried up. In the winter of 1876, the chloride of potassium had been unsuccessfully applied, and the following winter found it about to be abandoned. The bisulphide was tried, being applied in strict conformity with the rules previously deduced. The results are expressed as follows:

"We have the right and feel in duty bound to say that, from our experience at Cap-Pinede, we have attained the desired result. Those who have since visited the vineyard are struck with its appearance, and surprised to find that the treatment has been so effective that there is not a single phylloxera on the vines, nor does so much as any trace of them appear. This result has been obtained only by careful attention, which is necessary to render the remedy effectual."

Le Canet, near Marseilles.—A large vineyard about to be abandoned; was subjected to the proposed treatment. A small portion was left untouched, to better note the effect of the remedy. On the 12th of March treatment was begun. The whole quantity of bisulphide used was 30 grams per square meter, with an interval of six days between the first and second injection. An additional dose was applied subsequently, but this was proved afterward to be entirely unnecessary. On examination after the first application it appeared that most of the phylloxera were dead, and scarcely a single one was to be found on the roots. After the second dose it was absolutely impossible to find a single one on the vines even with the very closest search.

At Saint Menet similar results were obtained; likewise at Le Crissand, near La Renne, the results of which last are particularly valuable as demonstrating the superiority of the pure bisulphide over its mixture with oils, etc. A vineyard of 3,000 vines, all badly phylloxered, was divided in four sections, and denominated respectively A, B, C, D. Treatment was had on the 4th of July, 1878, as follows: A received 18 grams per square meter in a single dose; same amount applied to B, but in two doses, with an interval between of eight days; D was treated with a mixture of equal parts of green oil of anthracene and bisulphide, 18 grams per square meter in all; and to C the common oil of anthracene and bisulphide in equal parts was applied at the rate of 72 grams per square meter. In A some of the most feeble vines drooped a little at first, but soon recovered again. On the 4th of August there were found many parasites in D, scarcely any in C, and some in A. In B the phylloxera were all gone on Dec. 20th. When the leaves had disappeared from the vines, these same applications were repeated. The results were: On D were found some; on C about two-sixths of the vines still possessed the phylloxera. In A six vines out of the whole were found to possess the bug still living; on B all had disappeared. A vineyard made up of vines from all parts of France was treated according to directions, and five days after the second injection not one insect was to be found.

This completes the experiments of the company, and now follows the experiences of the viticulturists in carrying out the directions of the *Comité*. I intended to give some of these, but as they are very long, and as their results conform so exactly with those already had, I will pass them over, only remarking that wherever the directions were conforming to strictly, the results were as complete as could be wished. These results would be greatly interesting to and would accrue to the advantage of those who, being able to read French, can study them closely; and I should advise those who are able to avail themselves of all the contents of this latter part of the report, which, to all effects, beautifully proves the complete practicability of the results already given.

Throughout this work I have confined myself strictly to the results of the *Comité*, and where I could, I have given their experiences in detail. These being clear, definite, accurate and authentic, we may, as far as investigation has yet gone in California, namely, that of proving the complete identification of the insect with that of France, deduce conclusions, each one to

satisfy himself, and I feel convinced that the majority of those sufficiently interested in this subject to become the reader of these articles, will arrive at the logical conclusion which Prof. Marion has enunciated, viz.: That we are in possession of an efficacious method which has resisted a practical proof, that which is proof only and alone.

What will be the Cost of the Bisulphide?

Now that we have concluded as to the efficacy of the bisulphide, the next question which arises is: What will be the cost? The materials from which the substance is made are sulphur and carbon in some available form; the main principle of their combination is simple, but owing to the poisonous nature of its vapors and to the easy volatility of the liquid, together with its ready explosibility, there arises considerable expense incident to the condensing, storing and transportation. It is stored and transported in heavy iron barrels, the expense of which becomes considerable. In consequence of this it is evidently impracticable to import the bisulphide—it must be made here. From Eastern manufacturing chemists, the least it can be delivered on board the cars there is, counting the cost of the barrel, which is two cents per lb., 11 cents per lb. Add to this the freight cost and we are precluded from its use unless manufactured here. With the advantage of returning the cask or iron churn, the bisulphide can be manufactured here and furnished to the vinegrowers of this State at eight cents per lb., to be transported at the cost of the consumer. The means adopted here in selling the bisulphide will be identical with those in France, viz.: On ordering a lot a deposit will be made as security for the barrel which, on its return in good condition, will be refunded to the purchaser. This then, gives it to the vinegrowers at eight cents per lb. Now, making our estimate on this according to directions for use, previously deduced, we have the following as the cost of the bisulphide of carbon: 32 grams per square meter, the greatest amount necessary, if divided between two applications, to totally extinguish the phylloxera, is equivalent to 235 lbs. per acre; this at eight cents per lb. makes a cost of \$22.80; or, again reckoning for each vine, supposing our vines 6½ ft. apart each way, which makes about 1,000 vines per acre, we have per vine 4.56 oz. at eight cents per lb., which makes a cost of \$2.28 cents per vine. It must be borne in mind, that although we have made an estimate per vine, the vapor is not to surround the vine only, but to completely fill the whole body of the soil between the vines, as well as at its tap roots, in order that not one of the insect shall escape its effect. For vines at different distances apart, different rules must be observed for dividing up the quantity per acre; accordingly these will be determined and tabulated, and will then go with the directions for use, etc., which accompany each barrel. The smaller expenses I have not entered into here, they being so inconsiderable, and differing in the different localities.

The application is by means of an injector. This consists of a steel tube pointed at its lower end and attached to a zinc tank above. The whole is of a convenient length and has a cross-piece for a handle above the tank; below the tank and attached to the steel tube is a projection on which to apply foot power in inserting the instrument into the ground. When arriving at the proper depth a hutton on top is struck sharply with the hand, which, by means of an arrangement within, forces out from the bottom end of the steel tube the amount required for each injection. Care is required in the filling and use of this instrument, but any ordinary workman can manipulate it without trouble. The work is done very rapidly. This instrument costs, in France, 40 francs, or about \$8. These will be had at the manufactory of the bisulphide to be either sold to the user or rented. The plan is to have the bisulphide ready for sale shortly after the 1st of December, in order to make use of the two months most favorable to its application, viz., December and January, or later if necessary; but in all cases when the ground has not been recently plowed or worked.

The works are to be erected between West Berkeley and San Pablo, in some spot convenient for shipment by water and care; its transportation will be in iron barrels, with quantities to suit. It is expected that it will be not only applied as an insecticide, but that its application as an exterminator of rodents will be rendered equally feasible by the low price of 8 cents per lb. The bisulphide may answer the purpose in killing the ground squirrel and gopher that it did in Australia and New Zealand in exterminating the rabbits, which, without this, rendered it impossible to produce any vegetation. Its application to killing vermin and insects generally will doubtless be hailed by farmers as a great benefit.

The bisulphide, although explosive when mixed with air, boiling at a low temperature, etc., if carefully handled is perfectly safe, as evidenced by its use in France. The first year of its use, there were 432,000 lbs. distributed about the vineyards of that country, and not a single serious accident happened—all owing to their care in following the directions.

The writer in closing this series of articles wishes to thank Mr. Chas. Whetmore for the use of his library. I am also under obligations to Prof. Hilgard, of the University of California, who has watched this work with interest, who has rendered much valuable advice respecting the application of the bisulphide to California and who has kindly volunteered to render any

assistance which may become necessary in the manufacture, and in applying the reagent.

The vinegrowers, of Napa valley, in the meeting of the Vinicultural Club, of St. Helena, on the 6th inst., took active means to introduce the bisulphide by resolving to recommend its use to all the viticulturists as the best insecticide for the phylloxera; and farther resolving to do all within their power to encourage this, the first manufactory of this chemical on the Pacific coast. By reference to the *St. Helena Star* for Nov. 13th, full particulars of this meeting may be had. The writer of this article will be glad to furnish any further information regarding this question of the phylloxera, or anything in relation to the bisulphide of carbon to any one who may address him.

JOHN H. WHEELER.

530 Cal. St. (Room 3), San Francisco.

Debris Work.

Completion of the Yuba Dam at Marysville—A Success Predicted.

The Marysville *Appeal* contains an interesting account, in detail, of the debris dam across the Yuba, at that point, which was completed on Nov. 3d. After sketching the origin of the work and its early progress, the *Appeal* says:

Turning the Yuba river and filling the gap in the otherwise completed dam, through which the river has been permitted to run, was looked upon as one of the most difficult portions of the work, and it has proven so. The hydraulic mining companies along the Yuba, in order to reduce the volume flowing to the dam, ceased, on Saturday, the running of water into the river, and have been bolder back all they could by means of their reservoirs. The effect was noticed at the dam Sunday evening. It was expected that the gap could be closed on Tuesday, and the companies above were not to restrain the river after that day, but the work not being sufficiently advanced, they were then notified to hold the water until to-day. On Tuesday, the construction of a brush wing-dam across the river a quarter of a mile above the gap was commenced. Its object was to turn the river northward over certain high land to the low land on the north side. Another large force was kept filling the gap with brush and staking it down for foundation for the mattress. The force was kept at work during the night.

Yesterday the wing-dam had been effective enough to turn a portion of the river in the desired direction. This stream going across the sands struck the brush-dam about 10 o'clock, at a point about half a mile from the wing-dam and one-third of a mile from the gap. The heavy north wind kept driving the water back toward the channel, but the wing-dam was increased in height, and faced with sand bags that forced the water to cut its way northward to the low land. By the middle of the afternoon half the river was running that way, and the volume increased steadily until night. Where it struck the dam there was a strong current that did no harm and ran along the scraper ditch to the low places, which began filling. There was no seepage, and it was apparent that there must be several ft. of water piled up against the dam before there could be seepage or percolation through the brush. Seepage is what is expected, and will do no harm. The force worked last night, and to-day every man will be busy. It is expected that the gap will be crossed with brush and mattress, and some layers of logs be put on to-day, and the work be finally completed to-morrow. At noon to-day the water will probably have filled all the low places, and will begin to make its way through the brush at the north end of the dam. This stage of the proceedings will be watched with interest.

It is claimed for the dam that when the water is at flood height, it will slip through the dam and flow over it all along the crest at a depth of not more than one ft., and the fall will be broken by the lower ends of the logs. It is calculated that the water coming into the still pool will lose its velocity and deposit the material which it carries into the reservoir, and passing down the river will be able to cut out the channel below the dam. Much debris will pile up against the dam and gradually raise the bed of the reservoir to the height of the dam, but at the same time a new grade proportionately high will form and extend back up the river for miles, and all the addition thus made to the dam only increases its strength and solidity, and reduces the pressure on the slope of the dam proper, and it will form a solid hill in the river. The area of the reservoir, it is roughly calculated, is sufficient to hold 75,000,000 cubic yards of silt, and be from one to three years in filling. On top of this dam and the earth that will in time fill up to the crest, another dam, when necessary, can be constructed, it is said, at one-fifth of the cost of the present one, because the main cost was in the excavations and heavy foundations that will not be needed next time. Then, too, by condemning a valley south of the reservoir, it is claimed, by good authority, the storage capacity could be increased more than three-fold. At any rate it is a matter of congratulation that the work has been about completed under favorable auspices. The test will come this winter.

A dispatch to the *Call* yesterday says that the river was turned into its former channel late last night, and satisfactory progress is being made to complete the dam. No fears are entertained, but that the dam will be a perfect success.

MECHANICAL PROGRESS.

"Arguzoid"—A New Alloy.

"Arguzoid" is the name of a new composite metal which has just made its appearance in Glasgow, and even with the limited knowledge which we at present possess of it we are led to anticipate an important future for it. It is the invention of a gentleman well versed in the mixing of metals, and who has for many years been intimately connected with the oldest established firm of bell and brass foundries in the city of Glasgow; but the principal introduction of the composition in its commercial phase has been relegated to Messrs. Thompson, Sterne & Co., of Glasgow and London. In appearance it approaches silver nearer than any other metal or composition we have seen; is even whiter than a nickel-plated article, and in fact there is but the slightest shade of color departing from the white, that enables it to be detected from the more precious metal. At present it has only been introduced as a cast metal, being run into ingots, from which again it is remelted, and cast into any article required. It hammers well, and arrangements are now in progress to roll it into sheets. It is about half as much again in price as brass, is cheaper than nickel-plating or electro-plating on brass or copper, and has, besides, the unquestionable advantage of being solid throughout.

We have had an opportunity of seeing the metal in the ingot, in its hammered state, and of examining several manufactured articles, such as bath fittings, spirit-cocks, gas-brackets, carriage-handles, etc., in their finished state, and a nearer approach in appearance to sterling silver it would appear to be almost impossible to produce. Its cohesive strength is only surpassed by silver itself. Brass breaks at 10 tons pressure, phosphor bronze at about 14, while arguzoid requires nearly 16 tons before it succumbs. In ductility it is similar to brass, and the only point on which any doubt at present rests, is as to its powers of withstanding atmospheric changes as regards its color, but from experiments so far made, no fear is entertained by the inventor on that point. Its capabilities in this direction are, however, soon to be put to a severe test, and, if it passes through this ordeal scatheless, an immense field for its use in one direction alone will be open to it. One of the Cunard Co.'s steamers is to be fitted up entirely with arguzoid fittings. It is well known that nickel plating has been tried for ships and proved a failure, the action of sea-air and water completely destroying its appearance in one voyage. Plating with silver is necessarily costly and requires much cleansing. Brass is open to the same objection as regards cleaning, and is not considered good enough for high-class vessels. It is almost impossible to contemplate the revolution this composition will effect should further experiments confirm our present impressions, and we look forward in common with the inventor with interest to the result of his important invention. —*Ironmonger.*

IMPENDING ABOLITION OF PUDDLING.—Recent information from Europe concerning the dephosphorization process of converting pig-iron, furnished by M. Pourcel, of Terre Noire, France; Mr. Pink, of Hoerde, Westphalia; Prof. von Tunner, of Leoben, Austria, and other metallurgical experts, renders it probable that the laborious and unhealthy process of puddling will be shortly superseded. These and other eminent men differ as to the precise nature of the product of the pig-iron dephosphorized in the Bessemer converter; but all unite in regarding the material so produced as being certain to render puddled iron almost unnecessary. The ingot iron or steel made from phosphoric pig in the Bessemer converter is malleable, will weld, and bears severe tests for ductility, contraction of area, etc. This being the case, finished iron should be materially cheapened when the process has made greater progress. In Germany, dephosphorization is conducted on a large scale, and new works, with a total capacity of 600,000 tons per annum, are erecting there and elsewhere on the continent. —*Ex.*

IMPROVED ROLLING MACHINES.—Mr. William Harris, of St. Louis, has made some modifications in the construction of three-high sheet rolling mills which enable the rolling of sheets of No. 26 gauge, while in the ordinary mill No. 18 is generally the lightest which can be successfully turned out. The three rolls are placed one above the other, the top and bottom roll being smaller than the center roll. The center roll, under the Harris patent, is hollow, and a continuous stream of cool water passes through it, so that while doing twice the work of either of the others, it remains at a uniform temperature and prevents any expansion, the baneful effects of which any manufacturer understands in the breaking of rolls, buckling of sheets, delay in stopping to cool down, etc.

HOT BEARINGS.—It has long been known that sulphur cools a hot bearing, but the reason why is doubtful. Von Heeren states that the fine metal dust formed when a journal runs hot, and which strongly acts upon both journal and bearing, forms a sulphide with the sulphur. This compound, which grows soft and greasy, does not cause any appreciable amount of friction. Sulphur and grease, in combination, are in regular use on board the steamers of the North German Lloyd's.

Transmission of Power by Gearing and Belting.

The loss of power by transmission through gears has been ascertained to be, for the driver about 1½%, for the driven 1½%, and in the teeth 1½%—making in all about 4½%, when the diameters at the pitch line are eight times that of the journal. If the diameter of gears should be only four times that of the bearing, then the loss of power is 9%, or inversely as the ratio of the diameter of gears to bearings. The weight of gears and shafting have not been considered in this statement; in horizontal shafting, however, the weight has no effect, since the weight of gear is usually less than the pressure upon the teeth. In regard to shafting, the dimensions required for transmitting any given power depend upon the resistance to which it is subjected, the material composing it, and the length employed. It is usually subject to two forces—one force arising from its weight, with that of the pulleys, wheels and tension of the belts—producing what may be called simple flexure or bending. The other force arises from the power transmitted, and is called torsion or twisting.

To avoid undue flexure, the shafting should be proportioned to the simple weight and transverse strain, but, in addition, it must be remembered that the torsion or twisting must be transmitted without danger of rupture to the shafting, and, therefore, the two elements require careful consideration in all calculations, in order to secure permanence and safety. As it is the flexure or bending produced by lateral stress that limits the size of shafting, more than the tendency to transverse fracture, stiffness becomes a more important element than strength, and in all cases wrought iron would, on that account, be preferable to cast iron. Where it is necessary to drive machinery at a high speed, it is a great advantage to run the shafting at a proportionally high speed, as much will be saved in the weights, since much lighter shafting can be used to transmit the same power; besides reducing the friction arising from the unnecessary weight of large shafting. It also economises power that is absorbed by the greater friction. —*Leffel's Wheel Book.*

TO LINE UP SHAFTING.—Hang a nut, or other small weight, over the ends of the shaft by a piece of small twine, so the line passes over the exact center of the shaft, and the nut is within six inches of the floor. Hang at each bearing, or hanger, by pieces of twine, a nut from one side of the shaft, so the nuts are all six inches from the floor. Now stretch a line, one ft. high from the floor, from beyond each of the end lines, exactly touching them. The end lines are plumb from the center of the shaft, and the side lines are plumb from the sides of the shaft. The side lines, when the shaft is in line, must be one-half the diameter of the shaft from the straight line; so move the shaft until the side lines are that distance; then with a short spirit level level up the shaft from end to end, and go over each twice, and your shafts will be exactly in line. This can be done at any time, without trouble or expense. —*Ex.*

CEMENT FOR LEATHER BELTING.—One who has tried everything says that after an experience of 15 years he has found nothing to equal the following as a cement for leather belting: Common glue and isinglass, equal parts, soaked for 10 hours in just enough water to cover them. Bring gradually to a boiling heat and add pure tannin until the whole becomes ropy or appears like the white of eggs. Buff off the surfaces to be joined, apply this cement warm, and clamp firmly.

GREAT DEMAND FOR STEEL RAILS.—It is estimated that the rolling mills which are engaged in the production of steel rails have already received orders for 500,000 tons of rails for next year's delivery. These large contracts for forward delivery are rendered necessary by the fact that the mills are generally so fully employed as to be unable to supply but limited quantities upon new orders; and all indications point to a very large use of railroad iron for the year 1881.

COMPARATIVE VALUE OF WOOD AND COAL FOR FUEL.—It is safe to assume that 2½ lbs. of dry wood is equal to 1 lb. average quality of soft coal, and that the fuel value of the same weight of different woods is very nearly the same—that is, a pound of hickory is worth no more for fuel than a pound of pine, assuming both to be dry. If the value be measured by weight it is important that the wood be dry, as each 10% of water or moisture in the wood will detract about 12% from its value as fuel.

FALLING WATER.—Water in falling is subject to the same laws as other falling bodies, passing through one ft. in one-fourth second, four ft. in one-half second, nine ft. in three-fourth second, etc.; hence its velocity flowing through the side of a reservoir, bulkhead or any vessel, is the same as that of a heavy body falling freely from a height equal to the distance between the middle of the aperture or hole to the surface of water below.

SAWS.—A saw just large enough to cut through a board, will require less power than a saw larger, the number of teeth, speed and thickness being equal in each. The more teeth, the more power, provided the thickness, speed and feed are equal. There is, however, a limit, or a point where a few teeth will not answer the place of a large number.

SCIENTIFIC PROGRESS.

How Much of Nature is Matter.

A correspondent of the Boston Journal of Chemistry, in referring to Mr. Crookes' investigation of his assumed "Fourth State of Matter," asks: "What is matter? What part of nature is included in the term? It does not include mere force, and it does not include mind, but does it include light, heat and electricity, or the thing or principle, if there be one, of which they are manifestations? Is it confined to those things in nature which are subject to the law of gravitation?"

The term "matter" certainly does not include gravitation itself, and gravitation is not mere force. It is impossible for the logical mind to conceive a thing as having a separate potential existence as mere force; the very idea of force is that it is a result of a producing cause. There must be something in nature which produces the force we call gravitation. And there must be something else which produces the antipodal force of radiation. The idea of self-existing motion or force is but another form of the Indian's idea of the elephant on the back of the tortoise, etc. No such ideas are the result of correct logical deduction, or of mental or physical analysis; they are merely results of a mental dizziness to which weak and cowardly humanity is subject when looking into the vast abyss of the unknown. They are phantasms presented by the imagination which the intellect accepts as realities rather than gazing into the unfathomable gulf which yawns before it when they are brushed away. It is the merest speculation to assume anything in nature as ultimate, and such assumptions are treacherous to scientific progress, because when accepted as truth they put an end to investigation.

But considering these forces as original, potential things, and not mere results, does matter include all those things in nature which are subject to the force of gravitation, and exclude all those which are subject to the force of radiation? Accurate reasoning is impossible without exact definition of the terms used, and I have wholly failed to find a definition of matter consistent with some of the received ideas on the subject.

Nature is composed of things which are matter, and other things which are not matter. And obviously the first step in any true cosmic philosophy is to ascertain the line of demarcation between them. Until this is done, scientists, in respect to matter, must remain like colonists on the shore of a continent undertaking a geographical description of it without first circumnavigating it.

Let us first separate things material or matter, by proper terms, from things immaterial or not matter, and then we can determine whether these two classes are inter-convertible. It may be the fact (the analogies of nature in both classes seem to indicate it), that things which we call matter are produced from things which we call immaterial or not matter, especially if matter be limited to things governed by the law of gravitation; and if it be not thus limited, radiant matter is nothing new.

If Mr. Crookes has discovered that what is ordinarily called matter, that is, things subject to the law of gravitation, may be resolved into elements not subject to that law, a great advance has been made into the hitherto unknown. The next step will probably be to demonstrate, that what we call elementary substances are the result of collision in space of the cosmic forces manifested in gravitation and radiation, in much the same way that color and sound are produced, the character of the substance produced being dependent on the nature of the collision,—the gases corresponding to the higher notes in the musical scale, and the metals to the lower tones; and that these "notes from the music of the spheres" are the meteorites which the earth meets in space.

Then we shall want to know what it is in nature which causes gravitation, what causes radiation, and whether there are not other cosmic forces which have hitherto entirely escaped observation.

AN ILLUMINATING COMPOSITION.—Industry thus describes a simple way to produce an illuminating composition. Cleanse oyster shells by well washing, expose them to a red heat for half an hour, separate the cleanest parts and put into a crucible in alternate layers with sulphur; now expel the vessel to a red heat for an hour at least. When cold break the mass and separate the whitest parts for use. If enclosed in a bottle the figures of a watch may be distinguished by its aid. To renew the luminosity of the mass place the bottle each day in the sun, or in strong daylight; or burn a strip of magnesium wire close to the bottle. The sulphide of lime will thus absorb light, which will again be available at night time.

INTERESTING EXPERIMENT.—A simple and interesting experiment in magnetism has been introduced by Prof. Thompson. A thin plate of hardened steel is written upon with a magnetized iron style, and the path traversed by the style is thus magnetized. In order to read what had been written, filings are sprinkled on the plate and the plate is then placed in a vertical position, when, of course, all the filings fall off except those which happen to fall on the part of the plate magnetized by the style, leaving the writing in relief.

Four Comets Now Visible.

There is now the unusual, if not altogether novel occurrence of four telescopic comets in sight at one time; but none of them can be seen with the naked eye. With possibly one exception they are all growing fainter, and will soon be beyond the reach of the most powerful instruments.

The first is the one discovered by Mr. Scharbele, at Ann Arbor, Mich. But little has been reported in regard to this comet. Its position Nov. 4th, was in the morning sky: Right ascension, 5 h., 18.9 m.; declination, south 7° 33'. This is probably a new comet.

The second is the one discovered by Mr. Hartwig, of Strasburg, Germany, and also, independently, the next night, by Prof. Harrington, of Ann Arbor. We made full allusion to this comet in our last issue. Its position on Nov. 2d, was: Right ascension, 18 h., 21.7 m.; declination, north 9° 59'. This comet is supposed to have been seen before, but will hereafter bear the name of its recent German discoverer.

The third is known as Faye's comet, having been discovered by M. Faye, of Paris, in 1843. It has a period of seven and one-third years, and its orbit is almost as well known as that of a planet. Its position Nov. 2d was: Right ascension, 22 h., 53.5 m.; declination, south 0° 25'. This comet never approaches very near to the sun, and is a very faint object, even on most favorable occasions, except to very large telescopes.

The fourth of the series is just now attracting considerable attention. It was discovered by Lewis Swift, at Rochester, N. Y., Oct. 11th. This comet is quite transparent, as stars of the eighth and ninth magnitudes are distinctly seen through its very center as it passes over them. Such stars are only slightly dimmed by the intervention of the material of the comet. Mr. Swift writes: "The new comet which I found on the 11th inst. promises to be one of the most remarkable ones which have recently been seen in this country. Its great size, its slow rate of motion, and the fact that its movements are nearly in a direct line toward the earth, all combine to produce this result."

Mr. Barnard, an observer of Nashville, Tenn., in a communication to *Nature*, says: "It appears large and diffused with a slight condensation, at the middle or the preceding side, with probably faint evidences of a diffused tail." It is either approaching or receding, in nearly a direct line, to or from the earth, and may be seen with a very small telescope. Its position Nov. 2d was: Right ascension, 22 h., 0.0 m.; declination, North 34° 15'. It is moving moderately fast in a northeasterly direction. On the morning of Oct. 21st it followed the fourth magnitude star, α Pegasi, by about 1°. It has been seen with an 1½-inch finder.

ANIMAL ELECTRICITY.—M. Amat, in a recent account of his experiences in the Sahara, states that in that dry region, without insulating himself from the ground, he could often get long sparks by simply passing a pocket comb through his hair or beard. This succeeded best in dry, hot weather, on return from a long excursion over arid plains, the most favorable time being in the evening from seven to nine o'clock. Some of the lower animals, and especially horses, present electric phenomena still more strikingly. On hot summer days one sees on Arab horses long hairs diverging from the middle of the tail. On caressing the tail with the hand, a number of crackling sounds are heard, and if it be in darkness sparks are seen. The electricity liberated by the tails of horses M. Amat finds to be positive. Man, in direct communication with the ground, does not show such an accumulation of the electric fluid as the horse does, and friction is necessary to develop it. The horn of the horse's hoofs seems to act as an insulator.

PRIMEVAL MAN.—Prof. Dawkins has come all the way from England to tell the Boston people, in 12 lectures, what he thinks he knows about primeval man in theocene age. He professes to know something about it, by a study of the rocks, and the flora and fauna of the world. In the miocene stage of the world's history, there was no place for man; but "we will get nearer and nearer the period of man after a while, although we may not at first recognize him as he originally appeared." In this connection the Curator of the Peabody Museum at Cambridge observes, in the 10th annual report: "Dr. Abbott has probably obtained data which show that man existed on our Atlantic coast during the time of, if not prior to, the formation of the great gravel deposit, which extends toward the coast from the Delaware river, near Trenton, and is believed to have been formed by glacial action. From a visit to the locality with Dr. Abbott, I see no reason to doubt the general conclusion he has reached in regard to the existence of man in glacial times on the Atlantic coast of North America."

The phenomenon of the perforation of rocks by sand carried on the wind has been observed in the valley of the Rhone in France. A very violent wind often prevails in the neighborhood of Uzès, and drives large quantities of sand against a band of quartzose pebbles contained in a tertiary soil. The pebbles contain cavities which might be believed to have been made by human hands, but which are really produced by the often renewed friction of the sandy particles against their surface.

WILLIAM HOAR, says the *Tuscarora Times-Review*, is working in the upper levels of the Leopard mine at Cornucopia and extracting a small quantity of ore. He proposes, we understand, to continue the work during the winter. One or two other prospects will be worked during the cold months, but in all probability the population of the once lively camp will be reduced to less than 10 men before Christmas.

MARIPOSA.

DISCOVERY.—*Mariposa Gazette*, Nov. 13: Some Mexicans, it is said, have discovered a rich quartz vein in the vicinity of the Feleclana mine, and supposed to be a continuation of the same vein.

THE GEORGES.—The 2 veritable Georges, McCaffrey and Heiser, have concluded to bunk together again over on Buckeye at a quartz claim formerly worked by them. They are both practical miners, and we hope soon to be able to inform their friends and the public that they have struck it rich.

MONO.

MAMMOTH.—*Mammoth City Herald*, Nov. 13: Since last report tunnel No. 3 has been advanced 9 ft., giving a total length of 1,712 ft. The upraise from this tunnel has been advanced 38 ft.; total height, 100 ft. No. 6 crosscut has been driven 13 ft. The intermediate drift north, 133 ft above No. 3 tunnel, has been advanced 13 ft.

H. L. & M. C. JOINT TUNNEL.—Distance made this week, 29 ft., giving a total length of 1,273 ft. The rock is still hard, but breaking well, and next week's run promises to be the best made in many weeks.

LIEBOW.—Work in this mine is progressing as usual, but work at the arastra is suspended for a time, on account of the water-wheel being loaded with ice.

OLD TIME PROSPECTORS.—Ben Lowe dropped into the *Herald* office on Tuesday last. He informs us that he has completed the assessment work on the Chicago mines, in Indian district, and that he feels greatly encouraged and has high hopes of the future in that section. In company with Budd Harniss, Lowe started off Fresno way on Wednesday, with a view of prospecting in the foothills during the winter season. There are few more determined and patient prospectors than these heron mentioned, and their many friends will wish them luck in their ramblings.

STANDARD CO.—*Bodie Free Press*, Nov. 14: The company has extracted and shipped to the mill, 1,217 tons of ore from the 300, 385 and 550 levels. The average assays for the week is \$25; crude bullion received, 2,639 ounces, and the amount shipped to San Francisco, \$37,950.82. The shaft is now down 53 ft. Work was stopped part of the week to repair the boiler. The east crosscut from the north drift, 700 level, has been run during the week 10 ft.; total length, 55 ft. This crosscut so far has been run in very hard rock.

NOONDAY AND NORTH NOONDAY.—The 212 level—South shafts are furnishing the usual quantity of good milling ore and show no change since last report. The 212 level—The south shafts look well. The south drift on the east prong of the vein is now connected between the crosscuts which were run east from the middle vein and cut the east prong.

EAST CHANCE.—Supt. Graham makes the following report: For the past week our time has been taken up in repairing the tracks, commencing crosscuts and repairing buildings for the winter. A west crosscut has been run 13 ft to the west vein. In running this crosscut we have cut through veins of quartz, mixed with gangue. We have also cut a bore of very hard bird's-eye porphyry at the end of the shaft.

CHAMPION.—The crosscut on the 000 level is now in 203 ft. This work has resulted in showing up some very good veins, which have a strong character and give great encouragement.

UNIVERSITY.—Work in the University is now being confined to the 610 and 665 levels of the new shaft. Drifts are being run on the ledges, and when at a point immediately below the old shaft an upraise will be made to make the connection between the bottom of the old works and the 665 level from the new shaft. It is the intention of the company to explore the large body of ore known to exist in that vicinity.

BOSTON CON.—The north drift, 300 level, has been advanced 10 ft during the week; total length, 260 ft, and they are now running a vein of quartz 23 ft wide. The north No. 2 drift, 150 level, is being pressed forward; now in 100 ft. The ledge continues of the same favorable character.

NEVADA.

NEW PUMP IN THE IDAHO MINE.—*Gross Valley Union*, Nov. 14: A new 14-inch pump has been put in the Idaho mine, reaching from the surface to the 700 level, to take the place of the 12-inch pump heretofore in use, which will increase the pumping capacity about 25%. There are also being set up 2 steam capstans, to aid in setting the pumps and making repairs to them when necessary, and an auxiliary to the big pumping engine when extra power is required. During the extraordinary rains of last April a large amount of surface water had to be contained against, which found its way into the Idaho from the old workings of the Eureka mine, and it was all the Idaho pumps could do to hold the water. In fact, for several days they could not do so, as the pump tanks on the 7th and 8th levels were filled beyond their capacity, and the surface water that escaped out fall below filled the workings of the mine up to the No. 10 level, and interfered with work for some days. By putting in a pump of increased size all the surface water, which is troublesome as far down as a 700 level, can be handled easily, and do away with all danger of flooding the mine. From the 7th to the 8th a 9-inch pump will be continued in use, and the 8th level will be kept as high as possible, as there is any necessity for. The Idaho is now well prepared to contend against all extra water the winter months may bring.

ALPHA.—*Foothill Tidings*, Nov. 12: This mine is said to be looking extremely well. The quartz is paying much better at the mill than heretofore.

BLUE CLEAN-UP.—From 13 days' run, the Blue Tent gravel mining company, on Wednesday, shipped \$25,000 in bullion.

A DIVIDEND has just been declared by the Watt blue gravel mining company, of 7 cents per share, aggregating \$7,000, from the proceeds of a sale of the prospecting machinery.

The Scotts holding works are now all under cover, are large and of very imposing appearance. The shaft is being driven down to the level, and is to be continued by the aid of a Barleigh drill.

SCOTT'S FLAT.—On a visit to the hydraulic mines at Scott's Flat, the other day, we found all the boys at work, getting their claims ready for a winter's run. Hettington & Co. made a most successful run last year we learn, taking out big pay, and now have work well along to start washing so soon as water comes. The Mackeral Bank hydraulic mine, on the north, is getting ready for a winter's run, having a fine bank of gravel in sight that will prospect from top to bottom. This claim has recently been handed to San Francisco parties. Besides these 2 claims, there are several others that are preparing for work. On the other side of the ridge, south, and on the same channel, the Sargent & Jacobs claim is being steadily worked by drifting, and is said to be paying well. On the west side, the Sargent & Jacobs claim is being worked by drifting, and is said to be paying well. Up, owned by a Grass Valley corporation, which is driving a tunnel to tap the channel, and late reports are that they have struck gravel in the face.

PROVIDENCE.—*Transcript*, Nov. 16: The Providence mine is in full operation. This is the biggest mine on the Pacific coast. If worked to its full capacity a 100-stamp mill could be kept running for years, and employment given to 500 more men than are now employed there. A RICH STRIKE IN QUARTZ.—A rich strike in quartz has recently been made by Messrs. Sharp & Baker, on the Baker ranch, near the Sallor Flat hydraulic claim, Blue Tent district. The ledge is said to be about 30 ft wide, and exceedingly rich in free gold. A quantity of it that was ground in a rude stone mortar yielded a large amount of the precious metal. The development has created considerable excitement in the limited circle where it has heretofore been known.

RICH STRIKE IN THE DEADWOOD.—Nearly a year ago the pay chute in the Deadwood mine suddenly gave out between the 320 and 420 levels, and since that time assessments have been the order of the day. We are now rejoiced to announce, however, that the pay chute was replaced on Thursday, and has every appearance of being as rich as ever. It shows a width of 2 ft at a distance of 12 ft. It was discovered by crosscutting into this hanging wall.

New pipes will be added to the pump and the mine will be all right again in a few days. Before the water came in the gravel was the best ever seen in the mine. That mine has a glorious future.

PLACER.

QUARTZ MINING NEAR AUBURN.—*Placer Herald*, Nov. 10: C. H. Mitchell, of the Grass Valley Union, was in Auburn during the first part of this week, and while here he improved the opportunity to visit some of our quartz miners. On returning home he wrote of the district as follows: Quartz mining is becoming an important industry in the vicinity of Auburn, Placer county. There has been more prospecting and more systematic mining work done in that section during the past season than at any previous time. As an evidence of the progress being made in quartz mining, there have been 4 mills recently built in the district, containing in all 37 stamps. The future of quartz mining in the Auburn country is encouraged very encouraging by experienced quartz miners.

PLUMAS.

CASCADE MINE.—*Quincy National*, Nov. 13: This property, situated at the head of Grizzly creek, has recently been a new departure, and active operations are now in full blast. Seven hundred feet of large iron pipe will soon be at the mine from below, and the teamsters are hauling 10,000 ft of lumber from Gila's saw-mill to the mine. A large ditch is being dug, and this calculation is to have the mine ready to run by the time water comes in the spring. There is no doubt but that the Cascade is a good mine, if properly worked, and the present operations indicate that it will now be made to pay.

LAKE WATERS.—A short time ago some samples of Cherokee quartz were sent to New York; not assorted specimens, but taken from a vein 11 ft in width. Assays returned give \$250 per ton as the value. The Cherokee mines are forging ahead rapidly, and give unmistakable indications of developing into a grand property and a bonanza for the owners.

CARRY WATER.—*LAKE CO.*—This company has purchased 2,500 ft of iron pipe for use on the line of their ditch, to carry water past the land slide. New flumes will be constructed for 3 miles, and the ditch will be enlarged to double its present capacity. The distance from the reservoir to the Green Mountain mill is nearly 8 miles, and when the present improvements are completed, the ditch will afford a permanent supply for all time to come, without interruption.

GOLD STRIPS.—A full force of men are doing the regular work on this mine. The Kerr tunnel struck the Goodwin vein a few days ago, which shows fine ore. Both the Gold Stripes mills are running steadily on high-grade quartz, and everything is ready for a successful winter's run.

SIERRA.

MEN WANTED.—*Mountain Messenger*, Nov. 13: Workmen are wanted at Morristown to fit up the American company's claims. Steady work and good wages as long as the weather holds good.

MACHINERY.—The Alaska mining company, of Pike City, has purchased the machinery of the Watt blue gravel company, of Nevada county.

FITNESS UP.—The new company that has taken hold of the old American company's mine, at Morristown, is now fitting up for next season's work. The new Superintendent, Mr. Wheeler, is making every effort to get things in ship-shape before bad weather sets in.

MINING PROPERTY DESTROYED.—*Nevada Transcript*, Nov. 16: Last Tuesday a fire started in the woods near the Savage placer mining company's claim in Sierra county, and, owing to a high wind that prevailed at the time, the property of this claim, in round figures, \$37,000, but the boarding house was burned, besides a lot of timber and tools being destroyed. The catastrophe caused a suspension of operations at the mine. The above information is obtained from a gentleman who came down Sunday morning from the vicinity of the Savage claim.

HOWLAND FLAT.—*Cor. Nevada Transcript*, Nov. 16: The merchants of Howland Flat are laying in the heaviest stock of goods ever shown at the place. Goods are already being shelved in a fire proof store and cellar worth \$27,000 worth of provisions and implements for mining.

BALD MOUNTAIN.—The Bald Mountain gravel claim, Forest City, continues yielding princely revenues. The main tunnel of that mine is now in over a mile and a quarter, with no apparent decrease in the richness of the channel. The tunnel of the Bald Mountain Extension Co., at the same town, is in over 2,750 ft in the mountain (within 150 ft of their own ground), 2,300 of which is in air line, with the remaining distance bending west of north. The last month's assessment, \$1,800, delinquent November 9th, has just been settled in full. This has been the regular levy for the past two months, and a third of the same amount will be ordered by the directors for November.

Up to the present time the total sum expended in the development of this claim is in round figures, \$37,000, over \$1,350 to the interest. Only about \$13,000 of this has been applied on the tunnel, which, if run by the average San Francisco capitalists, at their usual extravagant minimum expense of \$15 per ft, in this county, the outlay would have been \$11,250. Considering thus far not a fair average specimen of the nerve and persistence of our miners, and the fact that the gravel is prospect on an average leads embedded hundreds of feet under mountains of lava, pipe clay, boulders and all other imaginable debris. A few days ago the contractors passed through a quartz ledge, and are now again in very soft bedrock with the water flow steadily increasing, deemed by those whose practical mining experience should be a very accurate gauge, a good evidence of near proximity to a gravel lead whose store of gold is yet an unsolved problem for the future to determine.

TUOLUMNE.

ROUON AND REAT.—*Sonora Independent*, Nov. 13: The Old Rough and Ready drift and hydraulic claim is in a prosperous condition. The company has drifted a great distance and has found the gravel in prospect on an average about 10 to the cubic yard. A large amount of this gravel is in sight, and lumber is being hauled to the ground for the purpose of erecting sluices for washing.

NEVADA.

WASHOE DISTRICT.

The following statements have been made by the Superintendents of the Comstock mines for the week ending Nov. 13:

BELECHER.—The east crosscut on the 2750 level has been advanced 7 ft; in this crosscut a drift shaft has been started and run a distance of 13 ft.

UNION CON.—On the 1000 level the work of repairing the north lateral drift is still continued. On the 2500 level the west drift from the upraise has been extended 10 ft; No. 2 winze has been sunk and timbered 5 ft; the joint Mexican upraise has been extended 10 ft.

MEXICAN.—On the 2500 level the joint Ophir cast winze has been sunk and timbered 5 ft during the past week. A hoisting engine is now being placed in position at the top of the winze.

CON. VIRGINIA.—During the past week 1,107 tons of ore have been extracted from the slopes on the 750 level, of the assay value of \$17.65 per ton. On the 2000 level the joint Best & Belcher winze has been sunk and timbered 6 ft.

CALEDONIA.—Pumps have been run an average of 133 hours per day, consuming 5-6 cords of wood.

OPHIR.—On the 2000 level the north drift has been extended 15 ft. On the 2500 level the joint Ophir and Mexican winze has been sunk and timbered 5 ft, and a hoisting engine is now being placed in position.

SIERRA NEVADA.—On the 2300 level west upraise No. 1 has been advanced 20 ft during the past week; total, 157 ft. On the 2400 level repairs completed and work suspended. On the 2500 level the north drift has been advanced 20 ft; total, 262 ft.

CHERRY CREEK DISTRICT.

SHIPPING.—*Hamilton News*, Nov. 11: A gentleman just in from Cherry Creek informs us that the Star company

ing well and the present output is likely to be increased rather than diminished.

The Exchange mine is running a 5-stamp mill and turning out some good bullion.

This company that recently purchased the Genoa and Tescup has secured important water rights, and will erect a 20-stamp mill during the coming winter.

TAKEN altogether the outlook of Cherry Creek is bright for the future.

The San Jose company, at Eran canyon, has put a force of men to work at their mines, and we hope before long to learn something of interest from that camp.

EUREKA DISTRICT.

A NEW STRIKE.—*Eureka Sentinel*, Nov. 14: Mr. M. H. Joseph brought down last evening some very rich ore from the El Dorado No. 2. The workmen in the mine have been running through iron rock of late, but yesterday struck a vein of ore which will assay over \$100 per ton, square in the bottom of the shaft which they are sinking. It is about 10 inches in width, and indicates an ore body of good size.

THE ATLAS FURNACE.—About the 1st of next month the Atlas furnace will start up on Dunderberg & Williamsburg ore. The furnace will be relined this evening. The work is being done excellently, and when all is ready, Atlas Hill residents can count on a lively dose of fumes for at least 3 or 4 months. About 20 tons of ore per day are being deposited in the bins, and their capacity is sufficient for 1,000 tons. The Dunderberg ore averages about \$100 per ton, and some of it is remarkably rich. Those who have the contract to deliver coal will put it in on the 20th inst., and thereafter according to the demands of the company.

MINING TAX.—*Eureka Sentinel*, Nov. 14: The Assessor's quarterly statement shows the amount of bullion tax paid by the different mines in the district, for the quarter ending September 30, as follows: Richmond Co., \$3,524.71; Eureka Co. Co., \$1,104.60; Ruby Dunderberg Co., \$103.82; Williamsburg Co., \$55.90; Grant Co., \$18.50; Mountain Boy, \$10; Phoenix Co., \$3.20; Jackson Co., \$2.18; Geddie & Bertrand Co., \$2.07. Total amount paid for the quarter, \$4,805.43.

DEBUNK.—At a recent election held by the stockholders of the Bayard Tylor mine, in the East, Wm Liggett was declared the company's choice for Superintendent, and a committee was appointed to come out here and confer with Liggett, and other interested parties, on the best plans for resuming and prosecuting work in the mine.

THE IDAHO MINE.—Mr. Thomas, the contractor in the Idaho mine, has nearly finished the 50-ft winze, but from Mr. A. W. Atchison we learn that work will be continued. They already have a 15-ft vein of low-grade ore in sight, and with such prospects the San Francisco Co. are not the men to let go. Mr. Atchison is busy putting the buildings of the company in repair for winter work, and when the winch-house is enclosed there will be no weather which can effect a stoppage of active operations. The shaft is now 235 ft deep, and 5 men are driving ahead as rapidly as possible. They have a small quantity of very good ore on the dump at present, and the management feel greatly encouraged with their prospect.

THE TITUS.—Hodgdon's now him is doing satisfactory work at the Titus mine, and Mr. Armstrong, the contractor for sinking the shaft, is getting along rapidly with his job. It is now upwards of 100 ft, and the formation is favorable for a "strike." Armstrong employs 4 men, and they put in good hours to develop this property.

ESMERALDA DISTRICT.

RICH COPPER MINES.—*Esmeralda Herald*, Nov. 14: Ludwig & Carter have been sent up from Union district, to work a mine, and are making rich developments. The mine is located about 3 miles from Greenfield. D. H. Jackson, of Virginia City, also has a valuable mine in that vicinity. Up to this time Ludwig & Carter have found a ready sale for all their ore at the chemical works of the Lyon mill and mining company, at Dayton; but in view of the advance in the price of copper and lead, they have a bright future before them. They have the water under consideration, and they deserve all that can be gained from it. The ore works from 30% to 40%.

UNION DISTRICT.

GOOD REPORTS.—*Eureka Sentinel*, Nov. 15: Good reports have often been sent up from Union district, and before long we expect to see some of our most wide-awake citizens take a hand in its mining development. A gentleman by the name of Bennett has been experimenting there on the ores with a little furnace, and his trouble was only from lack of blast. We understand that a very liberal offer was made Mr. A. W. Atchison to put in an engine for the needs of a furnace at the mine, and the gentleman now has the water under consideration. Wood, water and all the auxiliaries for cheap and rapid treatment of ores are about the mine in profusion, and all that the district needs is a live man or two with a little capital.

COLORADO.

PENNSYLVANIA GULCH.—*Fairplay Flume*, Nov. 11: A heavy fall of snow, nearly equaling what lay upon the ground last March, has proved somewhat of an interruption to mine developing. But the intrepid prospectors are surmounting this difficulty and present indications point to a lively month in December. Dewrow & Co., the owners of the gulch, have just resumed their regular operations on that property. They are reported as having refunded \$3,000 for the claim. Col. Henry Howland, one of the largest stockholders in the Black Hawk and Bulger company, whose property is located in this gulch, was in Fairplay the first of the week on business connected with the company, and being interrogated by a reporter, replied that it was desired to get the gulch prospect again in a few days as possible. The difficulty which has arisen over the Boss ledge, and caused its shutting down, may lead to good results after all. Development of the mine was progressing very slowly, and if the parties who hold an option on the mine do not see fit to carry it on any farther, we are given to believe that a good company stand ready to take the claim off their hands and prosecute work on a large scale.

GILPIN COUNTY.—*Georgetown Courier*, Nov. 11: The Hidden Treasure M. Co., of Nevada district, is again raising ore. The stamp mills of the county, as a general thing, are well supplied with ore. A new and rich find of a gold-bearing vein is reported from the southerly portion of York district in Clear Creek county.

SUMNER COUNTY.—The Eclipse is putting on a full force of men. The Eclipse has nearly 5 ft of mineral which is worth \$100 per ton at the mine. The Pittsburgh smelter has now employed about 32 men. Fifty tons of ore is smelted daily, which produce from 10 to 12 tons of bullion. The ore is supplied by the Quail and Aftermath. A number of excellent gold strikes have lately been made on prospects up Pacific gulch. The Anglo-American M. Co., operating up the Silver mountain, is still getting good quality of mineral in the Rose and Texas Girl, which, under stamps, yields 3 ounces gold per ton.

LAKE COUNTY.—The La Plata has declared its 14th regular monthly dividend of 7 cents per share, or \$15,000. The Evening Star Co. has declared its 2d monthly dividend of 50 cents per share, or \$25,000. The Dunkin S. M. Co., operating up the Silver mountain, is still getting good quality of mineral in the Rose and Texas Girl, which, under stamps, yields 3 ounces gold per ton.

PARK COUNTY.—The London company employs a force of 35 men, and has sent to the mill 10 tons of ore, 24 of which have been shipped and the balance piled up at the mine awaiting treatment. The Fannie Barrett mine has employed 30 or 40 mules and horses bringing down ore from the mine and taking back lumber and wood. This looks as if the new company know their business and will work this extensive property.

BOLDER COUNTY.—The work on development of the property of the Fairview mining and improvement company of Jamestown has already been commenced, and will be pushed during the winter. The Columbus is an abandoned telluride mine, upon which Messrs. Schaeffer, Barn-

They have at last been rewarded by finding pay ore. The Slie Co. are shipping a large quantity of \$25 ore to Mr. Nelkir's mill, which is being treated to a large profit. The Maine mine promises to be one of the best leads in the district. It has a large pay vein of good ore that will run from \$30 to \$40 per ton.

CURIA COXETT.—The Bull-Domingo litigation has been settled on terms satisfactory to all parties. Some very rich mines abound in the vicinity of Galena, and only lately a mill run of 65 ounces in gold was obtained from a claim on Democrat mountain. Mr. S. M. Allen has purchased for Chicago parties the Milno Rico and Richmond claims, situated on Round mountain and adjoining the famous Plata Verde mine. Some exceedingly rich ore has been uncovered in the new shaft on the California, at a depth of 45 ft. Work is progressing rapidly on the Silver Cliff Co.'s new mill.

SOUTHERN COLORADO.—A new strike was made last week in Copper gulch, finding Galena at about 8 ft. It is called the Empress Josephine; assays 23 ounces silver. The Unicorn lode, near Ashcroft on Castle creek, owned by the Worthington Bros., of Buena Vista, makes a fine showing. An assay on Wednesday gave a return of 30 ounces of silver and 2 ounces in gold. The Roa Lea, Stem Winder, Last Chance, Elk Horn, Burton, Minnie Lee, Black Tail and Ocean Wave, in Copper gulch, are continuing to show better where developments are made.

IDAHO.

GENTLE EMMA.—*Gwylho Avalanche*, Nov. 12: Sixteen tons of ore are on the dump at the Gentle Emma, which will be between \$200 and \$400 per ton.

LEWIS & STEVEN are taking out ore from the rich strike recently made on Florida mountain. It continues to improve as progress is made.

STODDARD & ARNOLD have struck the ore chimney on their ledge, the Dubuque, and it seems to be improving with every ft the shaft is sunk.

DURBO the week a strike has been made in the Potosi. The shaft is now 50 ft deep, and has taken out 100 tons of ore, and the ledge is large, as can be seen by the quartz, pieces of which are as heavy as a man can put in the bucket. Negotiations are now pending with Eastern capitalists to take hold of this property, which, if effected, will result in the erection of reduction works at the mine.

MONTANA.

PENOBSCOT AND BELMONT GOLD.—*Helena Independent*, Nov. 11: Capt. Ryan, Superintendent of the Belmont and Penobscot, brought into town, Wednesday, gold of the value of \$18,000, the product of those famous mines; \$12,000 of the amount was from the Penobscot and \$6,000 from the Belmont.

THE GLOSTER MINE.—On Thursday last a run of 130 tons of ore from the Gloster mine was completed, yielding the very satisfactory return of \$1,900. The tunnel is now in 105 ft, and when it reaches 130 ft, will be tapped from the surface. With a 0-ft vein of all paying and easily worked quartz, the future of the Gloster is a very bright one, and its owners are correspondingly elated.

NEW MEXICO.

EMERALD.—*New Mexico Mining World*, Nov. 10: The Emerald, in the New Placers, has a large body of ore in sight. The mine is owned by an Eastern company, for which Mr. Batchelder is the manager. An average assay returned \$80 per ton; \$15,000 has been offered for a two-thirds interest.

CAPT. BRITENSTEIN, of the St. Louis smelting and refining works, recently purchased from Livingston Bros. 3 claims in the Corillos, the Monitor, Sunshine and Wano; price, \$5,500. A contract for sinking a 120-ft shaft has already been let and work commenced.

On Baxter mountain, the same mountain on which the Homestake is located, is the Black Prince. The shaft is 38 ft deep and a north and south drift has been made to the extent of 46 ft. Assays have shown from \$25 to \$207 per ton.

SHORT AND SWEET, Golden Eagle, Platte de Verde and Alice Brinkman are the names of claims in the White Gals, in which 5 Topoka gentlemen are interested. Mr. J. G. Slonecker went down to the camp a few days ago for the purpose of sinking 100 ft on the claim that looked most promising.

ORE from the St. Paul mine, in Grant county, is worked at the Lone Mountain mill of T. Holson. Two men can take out 2 tons a day, and without sorting the mill returns \$20 ounces.

FARNS gold in the Little Mae, at the White Oaks. The best certificate announces 25 1/2 ounces of gold. Three other assays averaged 1 1/2 ounces of gold, and 3/4 ounces of silver.

The Cayote mountains are about 11 miles from the White Oaks camp. The Leadville mine is the best known, which produces ore that makes returns of 40% lead and 15 ounces of silver, and no flux is required.

We are informed that several parties at Lama Pardo, 20 miles north of Las Vegas, have a mining claim distant about 2 miles from that place, upon which a shaft has been sunk about 30 ft, and further work will be done at once.

The new Boston stamp mill, at Silver City, crushes 1 1/2 tons per hour.

The Torrence mine, at Socorro, shows a large body of ore running from 75 to 500 ounces at 100 ft depth. This reopening of old mines with drifts 100 ft in extent is reported from the San Felicitas.

Last month the Mimbre mining company shipped 2 bricks valued at \$5,639.20.

The Little Laddie, in the Mal Pais deposits, owned by N. S. Sunderland, has ore that runs 40 ounces at 7 ft. Mr. Sunderland is of the opinion that these earthenware imprints as they sink to them.

N. S. SUNDERLAND and others, owners of the Acme, Shakespeare, Gtero and Burns claims, located about 5 miles northwest of the White Oaks, have assays showing 36 ounces silver at 6 ft.

MANONEY & ROGERS sold a half interest in their Eureka claims, in Grant county, for \$4,000, showed \$100 apiece of the same lode in their unsinkable shaft, and it out for San Francisco as happy as clams at high tide.

OREGON.

MINING ITEMS.—*Democratic Times*, Nov. 12: The miners are beginning to question the probabilities of a good mining season. Everything is ready at the Sterling and Blue Gravel mines for next season's operations. D. M. Marden, of Kane's creek, is putting in a new flume and making extensive preparations for winter. Capt. Ankeny, of Portland, the enterprising mining capitalist, is now in southern Oregon looking after his mining interests.

Keefer & Co. have completed their wug-dam across Rogue river, near Jos. Douder's, and are engaged in mining the bed of that stream. Ous. Peil, of Gall's creek, reports the miners of that section making considerable preparations for winter. Ralph S. Smith, of San Francisco, special census agent, is now in Jackson county gathering mining statistics for several years past. Work is progressing steadily on Schump & Co.'s ledge in the Willow Springs district. The tunnel will be completed in about a month, and machinery for crushing quartz put in position before long. There is considerable good ore on the dump and much more in sight. The ledge is one of the best in the State.

THE SCHUMPF LEDGE.—*Oregon Sentinel*, Nov. 10: This quartz mine, the property of George Schumpf, which is situated in the Willow Springs district, has recently been visited by a number of gentlemen, among them two California mining experts, who pronounce it among the best, if not the best mining property in southern Oregon. There are about 300 tons of rich quartz rock already in the dumps awaiting the crushing process. The machinery for crushing is now being placed in position near the mouth of the tunnel. The tunnel itself is being dug into the side of the mountain for a distance of 200 or more ft, and is intended to drain the main shaft from which the quartz is taken. Two sets of men, a night shift and a day shift, are constantly working in the tunnel, and Mr. Schumpf expects to reach the bottom of the main or 70-ft

The Early Culture of Cinchona Trees.

As the possibility of introducing cinchona culture in this State is a subject of much interest to those who are studying the adaptation of our conditions for growths which succeed elsewhere, we have thought it timely to give a few points of information from the latest published treatise upon the growth of the cinchona as an industry. This treatise is found in "Spon's Encyclopedia of the Industrial Arts, Manufactures and Commercial Products," a valuable work which is now being issued simultaneously in London and New York, by E. and F. N. Spon, well known publishers of scientific and industrial books. The article on cinchona occupies nine of the large and closely-printed pages of the volume, and seems to us a very complete account of the culture of the tree, the preparation of its products and their commercial importance. As the cinchona in this State is but just entering the experimental state, and as the success or failure in its growth is not yet demonstrated, we have thought it most appropriate to select points relating to early culture, to the end that experimenters who have either the seed or the young plants may be aided thereby.

The trees prefer a rich soil, and thrive better on newly cleared forest land than on grass land; but the crown harks do fairly well in poor ground. While a free and friable surface soil is beneficial, an open subsoil is absolutely necessary. The least saturation of water at the roots is fatal to all species; perfect drainage must, therefore, be secured by a sloping situation, and other conditions.

The seeds germinate best at 65° to 70° F., tolerating a maximum of 80° F., and a minimum of 55° F. During the cold season, they are sown under glass; but during hot weather and rains, in open beds, sheltered by thatched roofs, about 5 ft. above the soil in front, and 2 ft. behind. The best soil is rich, mellow vegetable mold, alone, or mixed with clean, sharp sand. This is sifted, and spread in layers 2 to 3 inches deep and 5 ft. wide, on beds of cleared ground, of any convenient length, running east and west, with the open side toward the north. To prevent water lodging in them, they must slope to one side, a condition best attained by forming terraces on a hillside, and providing a path and a drain to each. Before sowing, the soil is rendered uniformly firm (but not hard) and smooth, by working it through the hand and gently pressing it down. The seeds are then placed loosely in bags, and immersed in cold water, undergoing 12 hours' soaking if fresh, but only 6 if they have been kept for some time. When taken out, they are gently stirred with dry sand, to separate them, and are thickly scattered on the beds, and lightly covered with a sprinkling of dry sand, intended only to steady them and get them into contact with the soil, and not to cover them; the beds may then be very gently pressed with a smooth board. Water is applied in the morning, and, if necessary, during the day, but not at late evening; deluging must be avoided, while a uniform moisture is maintained; the temperature of the water should approach that of the air. Additional shade and shelter have sometimes to be provided. Under glass, extra careful shading is necessary; and, after watering, especial care must be taken that the leaves become quite dry, before closing the frames. Every precaution will have to be taken against damping off; in very wet weather, the plants are sometimes infested by a fungus, whose ravages may be checked by gently stirring the soil. Germination takes place in 2 to 6 weeks.

When the seedlings have 2 to 3 pairs of leaves, they are put out into nursery beds, resembling the seed beds, but having a thicker layer of soil. They are best removed by inserting a small stick beneath them, and loosening the soil, so that they may be lifted out by the leaves, without the least injury to the rootlets. Holes 1½ inches apart, in lines 2 inches apart, deep enough to receive the outstretched roots of the plants, are made by means of a stick; into these, the seedlings are carefully placed, and the earth is filled in and pressed round, so as to thoroughly occupy the hole. Sometimes the seedlings are placed first in shallow boxes, which can be put under glass if necessary. When 4 inches high, the plants are re-transplanted, at distances of about 4 inches each way; and when they have reached 9 to 12 inches, they are placed in their permanent situations. The seedlings may be hardened before the final transplanting by removing the thatch for about a fortnight, commencing only in dull, cloudy weather. From the sowing to the final transplantation, some 8 to 12 months are required, during which the soil must be kept uniformly moist without being wet.

Propagation by Cuttings.—Cuttings planted in the open air and partially shaded will form roots in 3 to 5 months, and this is perhaps the easiest, cheapest and safest plan of propagation, especially for inexperienced cultivators. It is, however, very slow; and when a rapid increase of plants is required, a propagating house must be used. In either case, the cuttings are selected from wood of the current year's growth, preference being given to young shoots springing

from the lower part of the stem; they are removed in pieces about 3 to 5 inches long, just below the point where a pair of leaves grow. Young unexpanded leaves, if any, are left on the cutting; but larger ones are pinched off at the base. The cuttings as prepared are placed in 4-inch pots (Fig. 1); the cuttings, *a*, are set in a layer of pounded brick dust, *b*, under which is the ordinary potting mold, *c*, resting upon a stratum of moss, *d*, and a potsherd, *e*, to facilitate drainage. These pots rest in a bed of damp sand in the propagating house, exposed to a bottom heat of about 75° F. The atmosphere of the house is kept moist by means of a very fine syringe, but the cuttings must never be watered. When the cuttings have become rooted in the propagating cases the pots are hothly removed to other cases, where the plants are hardened off; when sufficiently hardy, they are taken up, and placed singly in pots about 3½ inches deep and 2 inches in diameter, formed of a mixture of cow dung and sand, as shown in Fig. 2. Before use, these pots are dried in the sun, which renders them as strong as an ordinary pot; when buried, they become sufficiently soft to be penetrated by the roots, but remain sufficiently cohesive to bear handling. They are made by hand at the rate of 400 to 500 a day, and cost but 1% of the price of an ordinary flower pot.

When the plants are to be put out in their permanent positions, they are removed hothly in the pots, and transported on wooden trays; holes are prepared for them at distances of 2½ inches apart, and the plants and pots together are placed in the holes, and filled round with earth up to the level of the stem, as shown in Fig. 3. This done, the plants are at once shaded

over them. Sometimes trenching or deep hoeing has been performed previous to planting; but besides being expensive, they are objectionable on steep ground, as favoring wash. Occasionally the size of the holes is increased to 2 ft. each way. The beds of hardened plants ready for putting out are deluged with water over night, so that the soil may be cohesive. On a day when the earth is moist, and the weather cloudy and damp (but not in heavy rain), the plants are taken up with abundance of soil around their roots, and are placed in the filled holes as quickly as possible; a space quite deep enough to receive the largest root without doubling is made by one hand, while the plant is inserted in the ground by the other; the soil is then filled in around, and thoroughly pressed down as the operation proceeds. The position of the plants in relation to the surface of the ground is indicated in Fig. 6; it is essential that they should stand on elevations, drained from above by a ditch, so as to prevent the possibility of earth being washed down and covering the bark—a circumstance that is sure to be attended by fermentation, followed by a fungus that destroys the bark and kills the tree. In the early days, the plants were put out much too wide apart; it is evident that no species will ever attain great size in India, and close planting has the advantage of affording shade to the roots, and reducing the growth of weeds, which are otherwise a source of much expense. Should the trees crowd one another, they can be thinned out, and thus yield an early crop of bark.

Shading and Staking.—In some localities, protection from the sun may be necessary. For this purpose, natural forest trees are quite inadmissible; the requisite shade is readily afforded

PROPAGATION AND CULTURE OF THE CINCHONA ILLUSTRATED.

with rough slabs of wood, arranged as shown in Fig. 4; and when they have grown above the wood, they are protected from chafing by a grass rope twisted round the top.

Layering.—A method by which a far greater number, and more rapid succession of cuttings may be got from a plant is that known as "layering," illustrated in Fig. 5. The operation consists in bending the branches of the plants into the soil, and cutting them half through at the bend. The object of this is to cause roots to spring from the cut portion of the branch, which is placed in the soil for that purpose. The juice of the plant escapes so rapidly from the cut as to induce decay, unless at once absorbed; this end is attained by placing a piece of thoroughly dried brick, *a*, in the slit formed by detaching the tongue, *b*. The latter is then kept down, if necessary, by means of the peg, *c*. When it would be inconvenient to bring the branch down to the soil, the latter may be raised in boxes. The best season for layering is during the rains. When well rooted, say, in 3 to 4 months, the layers are separated from the parent plant, and removed to glazed frames, where they are placed about 6 inches apart in good soil. Here they become established as "stock plants," and yield a constant succession of cuttings. In taking these, whole shoots must not be removed, but a few buds must be left to provide new shoots. Cuttings from stock plants are treated in the same way as any others.

Propagation by Buds.—A method of propagation which gives a large number of plants from a limited supply of wood is occasionally practiced; it consists in removing the buds with leaves attached, and placing them in pots plunged into damp sand, and treating them generally the same as cuttings. Roots are formed in 3 to 6 weeks, success depending entirely upon supplying sufficient moisture, without overdoing it.

Planting.—When a site has been chosen, the natural vegetation is completely removed. In very exposed situations, occasional strips of forest may be left as a break-wind; but they must be sufficiently far from the plants not to invade them by their roots, or by falling

by erecting, on the sunny side of each plant, a rough bamboo framework, thatched with grass or ferns, or by sticking leafy branches in the ground, etc. Where much staking would be required, cinchona cultivation had better not be attempted, because great expense would be entailed, and small success achieved. Some support, however, is occasionally demanded, when the method illustrated in Fig. 7 may be resorted to. The danger to be avoided is the chafing caused by the swaying of the plant; a soft material, such as grass rope, is therefore employed, and care is taken that it shall embrace the branches, without ever coming into contact with the bark of the stem. Staking is commenced when the plants are 1 to 1½ ft. high. A superficial boeing just around each tree is beneficial, whether weeds are present or not; but deep boeing would destroy the roots of the cinchona plants. Pruning must be restricted to the removal of such branches as would naturally fall in course of time, or such as project to the injury of neighboring trees.

SHOW UP YOUR ACCOUNTS.—As the laws of California now stand mining companies must furnish a statement each month of the affairs of the previous month. This provision is pretty well regarded, but occasionally the officers neglect their duty to the stockholders. They are liable to be "hailed over the coals" by any stockholder for this neglect. A case in point occurred this week. Walter I. Pilkington, who says that he is a stockholder of the Silver King mining company, has entered suit in the Superior Court against George L. Woods et al., directors of the company, to recover \$3,000 damages as a penalty for neglect to furnish itemized accounts of the affairs of the company for the month of October last.

AN EXPLORING EXPEDITION.—A late cable dispatch from London says that occasional announcements are made here of the organization of a new British expedition for the exploration of the Island of Borneo. When it is formed it will be known as the Reich Rock Expedition.

Causes of Hard Times in Nevada.

The Virginia City *Enterprise* says: While the entire country lying east of the Rocky mountains is enjoying a degree of prosperity greater than ever before known in the United States, a large portion of the Pacific coast region is suffering from hard times. This is more particularly applicable to the State of Nevada than to any State in the Union. For the reasons for this condition of affairs in this State we need not look far. Our chief industry is mining, and the exhaustion of the great bodies of ore on the Comstock, on which so many people thrived, is the chief factor in the depressed times which now prevail. But this is not all. The burdens imposed on mining are largely responsible. Chief among these are the discount on silver and the tax on the proceeds of mines. The latter it is within the power of the people to so modify that, while the mines shall contribute a fair share of revenue for the support of the State and county Governments, it shall cease to be an onerous burden on mining. For relief from the former, we must trust to time, Congressional legislation and some action by Germany towards remonetization. Senator Jones is the ablest and most ardent advocate of the interests of silver in Congress, and will, no doubt, renew his efforts in behalf of that metal, in which, of course, he will be seconded by Col. Fair, should that gentleman be elected to the Senate, of which there seems to be a strong prospect.

This State has no other industry or resource of any great importance except mining. At this time a great many mines are lying idle, and large chimneys of ore are unworked owing to the drawback we have mentioned. There is in the mines of various districts of the State enough ore to employ a large number of men in its extraction, but the ore cannot be profitably worked while silver is so low in price and the tax on bullion is so onerous. These ores are of low grade and it will not pay to mine them under present conditions. With a small percentage of the cost of production taken off, low-grade ores could be brought to the position of ores now classed as medium grade, and could be reduced at a profit.

The popularity attained by the once despised standard dollar should convince the Eastern statesmen that the American people consider silver a pretty good sort of money, and that their opposition to it was based on false premises. There are no politics in the money question now; it is simply a question of statesmanship. Greenbackism is dead, and a large volume of popular money is absolutely necessary. Gold is not a popular money, because the supply is too small and it is the money of the rich. Silver is the money of the poor and middle classes, and has been such for ages. We hope the Eastern bankers, money kings and financiers can be brought to a realization of the fact that the people demand silver coin, and, more particularly than all, we hope that the President, the Secretary of the Treasury and Congress will act with the popular side and give the country a law which shall result in the enhancement of the value of silver. By a law which will create a demand for silver, the value of silver will necessarily be increased, and if that increase brings the price up to par, the silver dollar is equal to the gold dollar in intrinsic value, and there need be no more talk about an 85-cent dollar.

There is another thing we hope; and that is that the people of the agricultural counties of the State will, by the time the Legislature meets, have become educated up to a knowledge of the fact that the present law for the taxation of the proceeds of mines is crushing the life out of the mining industry. The agricultural interests of the State are largely dependent on the mining industry, which enables them to market their products profitably. In insisting on the maintenance of a law that hampers the industry which creates their best market, the farmers and stock men of Nevada will be killing the goose that lays them the golden egg.

It has often been the subject of remark that the Southern States should be so conspicuously lacking in enterprise, as shown in their abstention from the manufacture of their great staple. Lately, however, a change has passed over the spirit of their dream. They have begun to manufacture cotton in earnest. The spindle are 7% of the total number employed in the country, and aggregate (including 113,000 in Maryland) 774,000. These Southern cotton mills are small, but more profitable, in proportion, than the more extensive establishments in the North. The saving in cost of raw material in the South is at least 20%—an important factor when it is considered that the raw material amounts to 64% of the total cost of the manufacture.

A DELICATE CALIPER.—The pachymeter, lately patented in Vienna, which determines the thickness of paper to the one-thousandth part of an inch, is outdone by the micrometer caliper, now coming into use in this country, which determines the thickness of paper or anything else, to the ten-thousandth part of an inch.

THE ENGINEER.

Railroads for Mexico.

The telegraphic reports of the past week refer to an important meeting of railroad magnates which was held in New York on the 11th inst., at which Mr. Romero, formerly Mexican Minister, was present, and urged in an elaborate speech that American capitalists should come to the assistance of Mexico in developing her means of interior communication. General Grant, who was also present, was called upon by Mr. Romero to express his views. He made a lengthy speech, urging the cultivation of friendly and commercial relations with Mexico, and saying that with building railroads and telegraphs there need be no more apprehension for the safety of capital invested there than in our own country.

After the meeting, Gould proposed the formation on the spot of a special committee to take into consideration the whole subject of railway communication with Mexico. This proposition was adopted, and the following gentlemen were informally named as members of the Committee: Chairman, Gen. Grant; Romero, representing Mexico; C. P. Huntington, representing the Southern Pacific railroad; Gen. G. M. Dodge, representing the Texas Pacific railroad; Jay Gould, representing the Missouri, Kansas and Texas railroad; C. T. Woerischoffer and Gen. Wm. J. Palmer, representing the Palmer and Sullivan grant; Edward D. Adams, representing the Mexican Central grant and the Sharon grant; Thomas Nickerson, representing the Mexican Central grant; T. Jefferson Coolidge, representing the Atchison, Topeka and Santa Fe railroad, and J. H. Work.

The following gentlemen were present and took part in the proceedings: Gen. Grant, Mr. Gould, Gen. Palmer, Mr. Coolidge of Boston, Mr. Huntington, Samuel Sloan, Mr. Woerischoffer, Russell Sage and Mr. Romero. It would appear from this action that the leading railroad men of this country are really looking to our sister republic as a source for the future feeding of some of the great railroad lines of the country. Such commercial connections, based upon proper diplomatic assurances of protection to investors, would do more to build up Mexico and enrich our own country than any other enterprise which is now open to our capitalists. It is to be hoped that the countrymen of Mr. Romero will catch some of his own enthusiasm and confidence in the enterprise which he is fostering.

THE CANADA TRANS-CONTINENTAL RAILROAD. The Toronto Evening Telegram of Nov. 11th, has a lengthy editorial on the Canada Pacific railway terms, supposed to come from the highest authority. It says: "The Government gives a syndicate, \$25,000,000 in cash and 25,000,000 acres of land, to finish portions of the road at present being constructed, and hands them over, with the portions already constructed, to the company, when the whole line is finished. The value of the portions of the line constructed and handed over by the Government is roughly estimated at \$30,000,000. The company gives \$1,000,000 and a certain portion of land as security for the working of the line. When the line has been worked for a period deemed sufficient to insure its continuance, the security, lands and money, will be returned to the company with interest. Estimating the land at \$2 per acre, the gross subsidy, with the completed sections, represents the sum of \$105,000,000. The Government pays the syndicate for the construction of the road." If the above statement is correct, there need be neither difficulty or delay in the construction of this proposed northern highway across the North American continent.

THE LONGEST TUNNEL IN THE WORLD.—The Joseph II. mining adit, at Schemnitz, Hungary, begun in 1872 and finished last October, is now the longest tunnel in the world. Its length is 16,538 meters, that of the St. Gotthard tunnel being 14,620, and the Mont Cenis tunnel 12,233 meters. The object of the adit is the drainage of the important gold and silver mines at Schemnitz. It furnishes a geological section more than 10 miles in length, and gives not only valuable information as to the downward prolongation of the lodes known in the upper levels, but some new ones have been traversed, and the entire series of rocks, with their mutual limits as well as modifications and occasional transitions, are disclosed without interruption. The entire cost of the tunnel was 4,566,000 florins—about \$2,300,000. Its height is three meters; width 1.6 meter.

VALUE OF GOOD ENGINEERING KNOWLEDGE. Col. Waring has been in Pittsfield, Mass., to make plans for sewers in streets not already provided. The commissioners intended to put down an eight-inch pipe, but Col. Waring thinks a six-inch sewer is large enough, and that six ft. under ground is better than eight or ten. One sewer, estimated to cost \$15,000, he thinks can be laid for \$4,000, and under his plan the sewers in the district, which have already cost \$48,000, could be built for \$20,000.

The deepest perpendicular shaft in existence is the Adelbert shaft in a silver-lead mine in Příbram, Bohemia, which is 3,280 ft. deep. Twenty years ago a mine in Hanover reached a depth of 2,900 ft., while there are numerous

USEFUL INFORMATION.

A PAPER HOUSE AND PAPER FURNITURE.—The multiplying applications of paper are strikingly illustrated by the fact that in the recent Sydney exhibition there was shown a house, built and furnished throughout with articles made of paper. The structure was one story high, with the skeleton or frame-work made of wood. The exterior was covered with panels made of paper pulp, while the interior was covered with the same material—plain on the floor, but forming splendid arabesques on the walls, and molded in imitation of plaster on the ceilings. The doors, cupboards and shelves were of the same material, while the entire furniture, including chandeliers and a stove in which a fire could be lighted, was made of papier-mache. The carpets and curtains were of paper, and there was a bed-room, in which there was not only a large bedstead made of papier-mache, but blankets, sheets, quilts, and female under-clothing, dresses and bonnets in the latest style, composed solely of carton-pate. A series of benches were given in this building, in which plates, dishes, knives, forks and glasses were all of paper.

THE POPULATION OF THE WORLD.—Dr. Behm and Prof. Wagner, German geographers of standing, who have devoted much attention to the statistics of population, have just issued a new edition of their calculations. They arrive, after great labor, at results which we quote, because they modify materially the estimate popularly current in Great Britain:

Europe.....	315,920,000
Asia.....	888,704,000
Africa.....	205,670,000
America.....	95,405,600
Australia and Polynesia.....	4,031,000
Polar regions.....	82,000

The world.....1,450,920,600
The calculation for Europe, which must be substantially accurate, is much larger than the usual one, but even then the immense bulk of humanity, 10 in 14 of mankind, dwells in Asia and Africa, a fact which the philosophers will do well to remember. The Londoner or Parisian is not exactly "Man."

TO MAKE VINEGAR.—Among the many recipes for making good vinegar we give the following: 1. Boil either corn, wheat, barley or rye, about one pint of the grain to a gallon of water, strain, and to the liquor thus obtained add syrup or sugar until pleasantly sweet. Let stand in a warm place, and you will soon have good vinegar. The stronger and sweeter the liquor the stronger will be the vinegar and the longer in making. 2. Pack in a jar the skins and cores of apples made in preparing pies and sauce, and cover with boiling water. When another lot is made, add them and more hot water till the jar is full. In warm weather set the jar in the sun, carefully covered with a cloth; in cool weather in a warm place in the house. The apple do not rot at all. In six or eight weeks the water is turned into excellent vinegar and of an amber color. No yeast, nor spirits, nor acids, nor sugar, nor molasses are needed—nothing whatever but the skins, and cores, and water.

WASHING COMMON WORKING PANTS.—The Scientific American gives the following as the best method for washing a pair of common working pants, that is tolerably greasy, so as not to discharge the color. It is impossible to wholly prevent the washing out of the dyes; still, if treated in the following manner, and not allowed to remain too long in the water, the effect of the washing on the dyes will be less apparent: Water 1 gallon, soap $\frac{1}{2}$ lb.; boil to dissolve; add 2 oz. borax; dilute with about 8 gallons of water; work the goods through as quickly as possible, and rinse without wringing. An aqueous solution of 1 part copperas and 7 parts logwood extract, may be used for reviving the faded color of cheap black goods.

COFFEE FUMES A POWERFUL DISINFECTANT.—The power of burnt coffee as a disinfectant has been tested by some recent experiments made in Paris. A quantity of meat was hung up in a closed room until decomposed, and then a chafing dish was introduced and 500 grammes of coffee thrown on the fire; in a few minutes the room was completely disinfected. In another room sulphureted hydrogen and ammonia were developed, and 90 grammes of coffee destroyed the smell in about half a minute. It is also stated that the fumes of coffee quickly destroy the smell of musk, asafoetida and other powerful odors.

COLORS FOR SHOP WINDOWS.—A very beautiful amethystine color can be produced by dissolving 5 grains of salicylic acid in a little solution of ammonia, mixing this with 2 gallons of water or enough to fill the show bottle. To this is added a few drops of solution of chloride of iron, and afterwards a few drops of muriatic acid.

DEODORIZING INDIA-RUBBER.—Place the articles in powdered charcoal, contained within a vessel, which must then be closed and submitted to a temperature of 94° F. for several hours.

TO CLEAN BATTERY ZINC.—To clean off the hard scale that has collected on the zinc of a battery, take sulphuric acid diluted with two or three parts of water, and use a stiff wire brush.

A COLD PROCESS FOR MAKING COFFEE.—It is said that the full aroma of coffee can be extracted without any application of fire, as follows: Take five ounces of best coffee; roast and grind to a coarse powder; pour the grounds into a glass bottle, or decanter; pour on a sufficient quantity of cold water to cover the coffee; stop the bottle, or decanter close; set in a warm place for 30 hours; now filter the infusion by passing it through some fine lawn, or blotting paper placed on a glassfunnel, or by straining through muslin. The experiment, it is asserted, "will delight as well as surprise all ladies of intelligence and taste."

FINELY POWDERED METALLIC OXIDES for experimental or other purposes, may be obtained by igniting the resins of the respective metals. For instance, to prepare oxide of iron, melt some resin, and mix it with as concentrated a solution of iron and nitric acid as the resin will take up. Ignite the resulting resinous mass, in an iron plate, until the resin is entirely burned away; the spongy residue may then be rubbed to a powder, and the color may be altered by further heating.

PURIFYING SPIRITS.—Berliet has discovered the fact that raw spirit can be purified by treatment with a solution of nitrate of silver and subsequent rectification. From two to two and one-half parts of dry nitrate of silver are sufficient for 1,000,000 parts of crude spirits, a 10% water solution being employed. The odor is entirely removed from the worst quality of crude spirits by this infinitesimal amount of silver.

LIQUID GLUE.—One hundred parts of ordinary gelatine are dissolved in 400 parts of water containing from six to seven parts of oxalic acid. The solution is kept for five or six hours on the water-bath, in a porcelain infusion pot, after which it is neutralized with carbonate of lime, the insoluble precipitate filtered off, and the clear filtrate evaporated at a moderate temperature, until about 200 parts are obtained. The product is a durable, slightly-tinted, but clear, liquid glue.

AN EMERALD GREEN OF GREAT BEAUTY, can readily be produced by dissolving a five-cent nickel piece in equal parts of nitric acid and water, then diluting with sufficient water.

BRASS COATING FOR STEEL.—For small articles, clean and plunge them in a mixture of six grammes each, of sulphate of copper and chloride of tin in a quart of water.

TO WHITEN SILVER.—Boil in a solution of 1 part cream of tartar, 2 parts common salt, and 50 parts of water.

GOOD HEALTH.

Disease from Drinking Water.

EDITORS PRESS:—In the PRESS of Oct. 30th a correspondent from Bakersfield refers to a previous article (Sept. 4th), in which some one who evidently knew little of what he wrote about, deniee that foul and stagnant water can cause disease if taken into the stomach, contending that the lungs alone take up the infection. The article was absurd enough in itself to warn your readers of its fallacies, but other popular articles show that the bow and the why of infection from drinking water is not yet so plain as it might be. He says: "Doctors frequently examine water with a microscope and see small animals in it," which they report as producing sickness. Now, these small animals differ in their nature as much as do larger ones. Thus we have snakes which are poisonous, and snakes which are harmless (and, as some bold, even useful in eating up insects which destroy our food plants). So while it is best to drink water as free as possible from all minute life, yet some few of these microscopic animals cannot live in foul water, and their presence in a water is almost a proof that it is safe for drinking purposes. But this subject is as yet in its A B C, and until it is more fully studied I would prefer to do as your correspondent does, and boil all water before drinking it.

That water, or even infected milk, may carry the seeds of disease into the body is too common and too well proved to be unsettled by anybody's belief to the contrary. Doubtless people may and do drink dirty water with seeming impunity for years, but nothing is now more certainly proved by the death returns of our towns than that cholera or other infectious disease has not half the power to kill after a pure water supply has been made compulsory on the inhabitants. More especially has this been seen in England, where the government has locked up old popular pumps and wells, long famous for their bright, pure-looking water, and compelled the introduction of a pure water from a distance. Not only have such measures reduced the mortality in a cholera epidemic from many thousands to a few tens, but the ordinary fall bowel complaint that carried off so many children has in many large cities fallen

off one-half. Army surgeons, again, are not too familiar with the dangers of bad water. In our own great war more men died from disease than from fighting.

The common impurities of dirty water weaken the health rather than produce positive disease, but the greatest dangers of such waters are their readiness to receive and multiply infection. Sow some corn on a dry sand and it will never sprout, grow nor multiply its kind, but sow it in a well-mannered, moist earth, and it rapidly and abundantly multiplies itself. So with disease. Probably all diseases—hnt certainly all of the infectious kinds—have their seeds. Sow them sparingly in pure water, or on a healthy body, and their infective power is slight, but in dirty water or on a weakened body their multiplication is sure. Instances are innumerable in medical literature of the introduction of a single case of typhoid fever into a town supplied by surface wells being speedily followed by quite an epidemic, due to fever-seeds getting into wells by soakage from the cesspools. The same fever has facts in its history that completely demolishes the idea that infection is received only by the lungs. In most large hospitals this fever is treated in the common sick wards, so little does its infection spread by air. Thousands upon thousands of cases yearly lie in beds but a few feet removed from other beds where rheumatism, dropsy and other common diseases are treated, and yet no case of this fever has ever occurred from such air infection. But let one drop of the excreta of a typhoid-fever patient fall into the milk or other fluid food and infection is almost certain to the person who allowes it. Pure water is not so certain to carry it, but has done it, probably from receiving a large quantity of the poison. Surface water resembles a fluid food more, as it contains nourishment for the germination of the fever-seeds.

Whilst, however, dirty water weakens our resisting power to disease it is as foolish to look for fever from it, if it contain no fever-seeds, as to expect corn to grow from a hushel of mixed seed into which no corn had been put. But one common cause of diseases seems to follow very much on the use of well water exposed to the drainage of cesspools or surface filth, and that is sore throat. If sore throats are common in your home look to your water supply or to your drains. The water might be good and yet receive infection in the house from drain-air through untrapped or leaky pipes.

A rough test for the purity of a water which may appear clear to the eye and pleasant to the taste, is to half fill a well cleaned bottle with it, cork it loosely and keep it in a warm place (about 80°) for a few days, shaking it occasionally. If immediately after shaking it be uncorked and held to the nose, and no bad smell be detected within a week the water is probably safe. But boiling a water for a quarter of an hour, and then allowing it to cool in clean and well-covered vessels, is the safest plan with all drinking waters, for filtration it must be remembered cannot purify disease-infected water. SANITARIAN, M. D.

The Use of Grapes.

With the abundance of grapes grown in California, but little attention has been paid to the value of the fruit as an article of diet, both in health and sickness. They contain a considerable amount of hydro-carbonaceous matter, together with potassium salts, a combination which does not tend to irritate, but, on the contrary, to soothe the stomach, and which is consequently used with advantage even in dyspepsia.

According to Dr. Hartsen, of Canbes, in France, who has recently contributed an article on the subject to a foreign medical journal, the organic acids in grapes, especially tartaric acid, deserves more consideration than they have generally received. Their nutritive value has, he thinks, been much underrated. It is known that they are changed to carbonic acid in the blood, and possibly careful researches may show that they are convertible into fats. Dr. Hartsen thinks that they should be ranked with the carbohydrates as food. They have been found a valuable diet in fever, and the success of the "grape cure" in the Tyrol and other parts of Europe appears to show that they are positively beneficial in other diseases.

TO RENDER COD-LIVER OIL TASTELESS.—Dr. Peuteves, in a French journal, recommends in order to render cod-liver oil tasteless to mix a tablespoonful of it intimately with the yolk of an egg, add a few drops of essence of peppermint and half a tumbler of essaged water. By this means the taste and characteristic odor of the oil are entirely covered, and the patients take it without the slightest repugnance. Besides, the oil, being thus rendered miscible as the water in all its proportions, is in complete a state of emulsion as the fats at the moment they penetrate the chyle vessels, consequently absorption is better assured.

FRECKLES.—These troublesome patches indicate a disturbance in the function of the skin. The capillaries are congested with effete or excrementitious matter, hence the yellowish discolorations. Persons who are troubled with this, are in the habit of eating food which contains too much carbon. They are fond of butter, sugar, gravies, salt, rich sauces, etc. The character freckles represent is that of carelessness in diet, perhaps in washing, too, rather than anything of a special moral type.

SAN FRANCISCO:

Saturday Morning, Nov. 20, 1880.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Railroads and Progress; Expenditures on Claims; Mechanical Drawing; Alaska Mines; A New Vertical Sinking Pump, 321. The Weekly; New Processes; Military Engineering; Capt. Eads on Debris, 323. Academy of Sciences; The California Planer and Mather; A Season's Work in Alaska, 329. Notices of Recent Patents, 332.

ILLUSTRATIONS.—Knowle's Vertical Sinking Pump, 321. Propagation and Culture of the Cinchona Illustrated, 326. The California Planer and Mather, 329. The "Boss" Coffee Pot, 332.

MECHANICAL PROGRESS.—"Argusoid"—A New Alloy; Improving Abolition of Puddling; Improved Rolling Machines; Hot Bearings; Transmission of Power by Gearing and Belting; To Lineup Shafting; Cement for Leather Belting; Great Demand for Steel Rails; Comparative Value of Wood and Coal for Fuel; Falling Water; Saws, 323.

SCIENTIFIC PROGRESS.—How Much of Nature is Matter; An Illuminating Composition; Interesting Experiment; Four Comets Now Visible; Animal Electricity; Primalval Man, 323.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards; Notices of Assessments, Meetings and Dividends, 324.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Idaho, Montana, Oregon, Colorado and New Mexico, 324-25.

THE ENGINEER.—Railroads for Mexico; The Canadian Trans-Continent Railroad; The Longest Tunnel in the World; Value of Good Engineering Knowledge, 327.

USEFUL INFORMATION.—A Paper House and Paper Furniture; The Populus ion of the World; To Make Vinegar; Washing Common Working Pants; Coffee Fumea Powerful Disinfectant; Colors for Shop Windows; Deodorizing India-Rubber; To Clean Battery Zinc; A Cold Process for Making Coffee; Purifying Spirits; Liquid Glue; Brass Coating for Steel; To Whiten Silver, 327.

GOOD HEALTH.—Disease from Drinking Water; The Use of Grapes; To Render Cold-Liver Oil Tasteless; Freckles, 327.

MISCELLANEOUS.—The Remedy for the Phylloxera—No. 3; Debris Work, 322. The Early Culture of Cinchona Trees; Cases of Hard Times in Nevada, 268. Mining in Calaveras County; Tracing by Blows; Wonderfully Rich Quartz; Neglected, 330.

NEWS IN BRIEF, on page 332 and other pages.

Business Announcements.

Assayers Materials—Justinian Cair, S. F.
Dividend Notice—Eureka Consolidated Mining Co.

The Week.

The mining news of the week shows great activity in different quarters. This is specially noticeable in Utah, Idaho, Arizona, Montana and New Mexico. In Utah the mines are producing bullion in large quantities. In Idaho numbers of new mines are being opened and made producers. Montana mining affairs are quite flourishing. Arizona and New Mexico are both getting a good many new citizens, a large proportion of which go there to mine. The new camps offer better inducements than old ones, and where work is slack miners are moving on to new fields. In this connection the following item from the Virginia Enterprise is significant. It says: "There are too many people on the Comstock. The single men should branch out, as the labor field is fully occupied by men with families, and many of them are out of employment. The completion of the Southern Pacific railroad is destined to open up a big mining, agricultural and stock-grazing country in New Mexico and Arizona, which Territories offer a wider field for energetic men than Nevada now does or is likely to do for some time to come."

California has been blessed with no rain as yet, although it may be expected every day. The severe, dry northers which have prevailed of late have been very disagreeable, but as no young grass has been started, they have done no special damage.

A careful perusal of our summary of current mining news, to be found in other columns, will repay any one who is interested in mining matters. This condensation of the news of the day will show to what an extent the mining industry is carried on, and over what an extensive field it is spread. Those who are thinking of going to the mines can see which sections are the most promising, and in which sections the

New Processes.

The hydro-chlorine system of ore reduction is the latest thing in processes. It is a new system by which silver, gold or lead ores are reduced at a cost not to exceed \$6 per ton; the complete plant for a smelter of five tons daily capacity, including license, costs \$5,000. The advertisement in the New York papers announces that the process consumes but a small supply of fuel, either wood, coal or charcoal. The hydro-chlorine system is a radically new one. The company say that "by this novel system the full assay value is obtained, and, with some classes of ore, 10% to 20% more, it being a well-established fact that quite a percentage of the precious metals volatilizes under the ordinary fire assay."

This heats most of the new processes. Very few of them claim to get out over 93% or 99% of assay value, but this one proposes to secure from 10% to 20% more.

It seems to us that people with new processes, especially those involving chemical principles, as nearly all do, make a great mistake when they suppose the mining community to be entirely ignorant on such subjects. One man tells us that by adding a certain substance to a natural mineral water he can produce gold. Another, as in this instance, tells us that he can, by a smelting process, or one requiring a furnace heat in some way, obtain more from the ore than a fire assay will show to be present, "because a percentage of the precious metals volatilizes under the ordinary fire assay." Which leads us to infer that there will be no volatilization in his furnace.

Such assertions are idle. They make any metallurgist smile quietly, and any miner get his hack up, and think "those fellows are giving us taffy." And it is pure "taffy." They don't go to work and give the public a description of their process which will be intelligible, and from which the public may draw its own conclusions. The conclusions only, manufactured to order, are given publicly, and miners are supposed to swallow the statement, however absurd.

It was not many months since, a process was originated in this city for working ores. In that case we were told the ore yielded, by "vapor assay," certain numbers of dollars and cents, which ordinary fire assay failed to show. We were then told that fire assays were frauds, and did not show what was in the ore. That process and those "mines" are things of the past, but the fire assays are still believed in. Now again comes a process which will heat fire assays, and when we see the assertion backed by the evidence of some competent and disinterested metallurgist, we may take it into consideration for investigation. But we won't believe it then. Mining men know something about such matters, and are not so easily caught with chaff. When they hear of a process to get 99% out of the ore, they don't believe it; and when they hear of one that is going to get more than the assay shows, they either think the projectors are fools, or that the projectors think they are.

THE ARTHROZOIC CLUB.—The Arthrozoic Club of this city held its regular meeting on Wednesday evening in the rooms of the Viticultural Society. After the regular business had been transacted, the members were entertained by remarks from Drs. Kellogg and Bleasdale. Speaking of his trip to Owens valley, Dr. Kellogg wished to draw attention to two things which he witnessed there and thought they might be turned to practical account by agriculturists. The first related to the mode employed by the Indians of taking worms from the *Pinus ponderosa*, which they collect and prepare for food. They first carefully scoop out a little trench around the root of the tree—say six inches deep—then by burning under the trees such stuff as will make a thick smoke, when the worms make ways and come to the ground in search of pure air. The hanks of the ditch being composed of loose sand, the worms cannot climb it, and, therefore, are unable to reach the tree again. By this means the Indian serves a double purpose—provides himself with food and preserves the seed of the tree. The second related to a natural process of dwarfing trees. The *Pinus Jeffreyi*, whose tops often attain an altitude of 150 to 200 ft., was growing luxuriantly, when suddenly he came upon a grove—within 150 ft. of the giants—from whose tops a man could easily pick the cones. They had arrived at perfection, and the doctor was rather happy in the thought that he had discovered a new pine. On inspection it proved to be no other than the *Pinus Jeffreyi*, and the cause of its diminished stature was found to be a mineral spring in the immediate vicinity, which had saturated the ground on which the seed fell and had thus shorn the tree of its great proportions.

At a meeting of the Executive Committee of the World's Fair Commission, held this week, a report was read approving of Central park as the site of the fair, and calling upon the city and State authorities to grant the use of it. This decision will evoke great popular opposition, there being an inflexible feeling on the part of many that Central park must not be

Military Engineering.

We notice in the annual report of Gen. Sherman, a suggestion that "artillery officers should also be associated with the engineers in constructing, altering and repairing the sea coast defenses, because the men who have to fight these batteries should have something to do on their construction." This suggestion will be hailed with pleasure by the artillery officers, but will be entirely ignored by the engineers. The engineer corps is the most conservative branch of the public service. Its members are supposed to be selected from the cream of the graduates of West Point. They are, to a certain extent, more independent than any other branch of the service. The engineer officers are not apt to be moved about from post to post. They are never hurried in their work, and they have pretty easy times as a general thing. But they do not like to be interfered with. The artillery officers have frequently hinted a desire to have something to say about fortifications, but as they are systematically ignored, they always growl about the works. No artillery officer will ever acknowledge that fortifications are constructed as they should be; and no engineer is likely to concede that the artillery man knows anything about anything except guns.

When we come to think of it, however, we are reminded that most of our fortifications are useless for the purposes for which they were intended, by reason of the rapid improvement in the means of offense, during the past 10 years or so. Fort Point, at the entrance of the harbor, would amount to nothing in preventing the entrance of an iron-clad. Very extensive changes have been and are being made at Alcatraz, to fit it up as it should be. In truth, our Government works are so slowly accomplished, that half the time the work will be out of date by the time it is finished. This is due to the irregularity of appropriations rather than to any fault of the engineers, who cannot work without material. Gen. Sherman does not think much of our sea coast defenses, nor does he think them very necessary. He says: "For similar reasons, and because the commerce of the world is carried on in ships of 3,000 tons and over, and because of the heavy draft of war vessels, most of our sea coast defenses are superfluous. We now have 50,000,000 people, and the idea of any hostile force landing on our coast is preposterous. Yet our great commercial ports should be made so safe, that even an apprehension of danger would not be felt. Portland, Boston, Newport, New York, Philadelphia, Hampton Roads, Port Royal, Key West, Pensacola, New Orleans, San Diego, San Francisco and Port Townsend, should all be properly fortified and garrisoned. All the minor forts should be sold or abandoned. An annual appropriation of \$1,000,000 would in a few years put these forts in good order, and another million a year would properly arm them; and the Secretary of War and the President should have discretion in the disbursement of this money."

This last suggestion is a good one. The Secretary of War is more apt to know where money is needed than Congress is. If the money is appropriated for fortifications it ought to be put where it would do some good, and not be frittered away one place and another so as to accomplish little.

CALIFORNIA OAKS.—At the last meeting of the California Academy of Sciences, Dr. Engelmann, who is here investigating the forest trees of this coast for the U. S. Census, was asked for some information concerning our native oaks. Dr. Engelmann said that in the East he had been studying the oaks for a very long time. He thought he knew all about them, but when he came here this opinion was shaken. In looking at the specimens in a laboratory we think we can identify them. When, however, we go to the mountains and see the great variety of forms, we become confused. With the greater number of species he has little trouble, but with some, identification is very difficult. The most eminent authority on oaks has declared that the white oaks of California might possibly be a form of the common European oaks. Dr. Engelmann thinks that they are very distinct from the European or Eastern. A number of species are very distinct here. Dr. Engelmann suggests that botanists here should study the forms indigenous to their neighborhoods. In this way certain points will be cleared up better than they can be by any chance traveler. The local botanist may watch the tree at different seasons and note the changes. He will thus be enabled to clear up some confusion that now exists owing to the variety of forms.

A LEADVILLE special says: Owing to the fact that the fire in the underground working of the mines on Frier Hill, which started in the Chrysolite nearly two months ago, still burns, the Little Chief and other mines were ordered by the Court to suspend work temporarily. On Thursday night the Little Chief resumed operations, disregarding the injunction or the order to close its level against the approach of the fire. Eight hundred lbs. of giant powder were exploded this afternoon on the line between the Little Chief and Chrysolite, to break down the stopes. Another charge of 1,000 lbs. will be fired to-night. Six men

Capt. Eads on Debris.

Capt. J. B. Eads, Consulting Engineer of the State, has filed a report with the Governor. He recently visited the State, examined the Sacramento river and its tributaries with the view of determining the best methods to pursue to improve their navigation, and to protect the valleys from the further encroachment of debris from the mines. The report is very elaborate, and no condensation can do it the justice to which it is entitled. It is, in itself, the essence of conciseness, and would be marred by any effort to present it at less than a whole; but a sort of index to it may be given to outline its character. He begins by stating all his means of information relative to the valley rivers. He shows then the vast quantities of debris washed into rivers; that the catchment area of the rivers exceeds the valley area; that the flow of detritus has been vaster far than the most extravagant have given credit for, and points out how it has buried whole sections, and will continue to do so. He then considers whether Nature, by her process, would have done this, and explodes the idea that she would. He shows how the valley lands, being flat and absorbing rainfall, do not send soil in any material quantity to the rivers. He then considers how the filling up of the rivers is going on, how bars become islands, and the rivers are raised till they run on ridges. He next points out the only remedies known, to wit, to treat the rivers so as to enable them to carry off the sediment.

This is to be done by checking detritus descent by brush dams. This partially clears the water and gives it power to take up and carry off sediment below by leveling up the rivers. Next, this will increase their slope, augment the force of the current and give a scouring power. Lastly, they must be straightened in places in order to increase the slope or fall, and hence the rapidity of currents. He favors closing up the old river at Grand Island, dredging out Steamboat slough and forcing the river through there. He shows that the rivers have power to carry their flood waters when thus treated. He explodes the idea that increasing the outlet of the stream lessens the danger of the overflow. On the contrary, it injures the stream and takes away the force of the current and carrying capacity. He plainly intimates what must come if remedies are not applied, and leaves the conclusion fixed on the mind that one of the fairest sections of the State, one of the greatest valleys, will be rendered valueless to man unless its streams are properly and uniformly treated. Regarding Suisun and San Francisco bays, this extract from his report may be given in full: "As large areas of shoals which are now more or less exposed at low water, must, as a result of the correction of the river, necessarily be built up to very nearly the height of the natural banks by the deposits which will be removed from the shallow channels, and as many deep pools existing below the sand bars in the narrow parts of the river will be filled with the bar material removed, there is no occasion to fear that the rectification of the river will materially increase the amount of deposit accruing in the bays in the lower part of the river."

"In the slow process of nature, controlled by art, Suisun bay would gradually be reduced to the width of the river proper, and the bay of San Francisco would in time undergo a similar change. But it should be remembered that it is the maximum tides and floods which determine the magnitude of sedimentary channels. Hence the rapid drainage of the valley. Increasing the force of the floods will promote the discharge of the sediment into the ocean, for it will aid the tidal action in keeping it suspended until the greater part of it is finally discharged there. The sediment left in the water after the construction of the proposed works for arresting the mining detritus will settle much more slowly than that which now flows down, and must make the injury to the bays a very slow and remote occurrence."

"With respect to the influence of the tides upon the lower portion of the river, it is only necessary to say that the same laws we have been discussing apply with equal force to the motion of tidal waters in river channels. The inward and outward flow of the tides will create and maintain a channel in proportion to the maximum volume and slope of the ebb tide passing through the channel. Hence, where a tidal basis of great extent occurs, as at Port Royal, New York and San Francisco, the channel through which it is filled and emptied will be proportionately large, and as the depth and width of the river channel increases, the tidal water will enter with less frictional resistance, and the volume of the ebb will be proportionately greater. Therefore, as the improvement of the lower part of the river channel progresses, the force of the tidal action will increase and aid in maintaining such capacity as the combined influence of the river floods and tidal action, under a better system of drainage, will create."

FROM Eureka is announced the death of William H. Clark one of the oldest citizens of Nevada. In the early days of Nevada Mr. Clark was a merchant and wood contractor at Dayton. When the White Pine excitement broke out he went to that district and entered into business there, but when White Pine began to decline he moved to Eureka, then just looming into prominence, and there laid the foundation of a large business.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Dr. Behr in the chair. Donations were reported from W. G. M. Harford, C. H. Gilhert, R. W. Simpson and Drs. Englemann and Parry. Also, from Mrs. Dr. M. K. Curran, east and west-country rock of Hale & Norcross mine, Comstock lode, and specimens of silver ore from Hale & Norcross, Sierra Nevada, Gould & Curry, Overman, Union, Savage and North Bonanza mines. From C. D. Gibbes, volcanic rock and lava, and coral showing perforations made by shell-fish. Mrs. M. K. Curran presented quite a large collection of ores, minerals and rocks. Mr. Redding called special attention to this latter donation, and said that it was valuable from the fact that not only were the ores presented, but the country rock in which they occurred. This was always important, but generally overlooked. Miners when they saw specimens of ore from a certain locality always wanted to see the rock in which it occurred. The sample specimens of ore alone were of very little value without samples of the country rock. W. H. Dall, of the U. S. Coast Survey, who was present was asked to give an account of his trip to Alaska this summer. He complied with the request, and we have given his remarks in another column. Speaking of fishes, however, he said that in a general way the fishes were similar on the Asiatic and American sides; but there were some species only found on one shore.

They found quite a number of California fish that attained a high latitude, several found commonly in the market here, especially red cod, which was found a considerable distance north of Sitka, in large quantities and of a very good quality. They secured salmon, not only for specimens, but they formed a large part of their food during the season. There are a great variety of salmon recognized among here on the coast of Alaska, and the question arises in Oregon and California how many of these are distinct species and how many are to be referred to the very extraordinary changes which take place in the salmon from the time of leaving the sea till death, and to the local peculiarities.

Very few of them ever return to the sea, differing in that respect from the European salmon. In California and Alaska he believed that most of the salmon die after depositing their spawn. They found the Columbia river salmon extending through a large part of Alaska, when they came across a peculiar fish called the "king" salmon, which attains an enormous size, reaching 100 lbs. Then there are quite a number of trout, and near Sitka a very large trout is caught, the size of the salmon.

Mr. B. B. Redding, one of the California Fish Commissioners, called attention to a popular fallacy concerning the universal death of salmon after spawning. He said that although 78% or 80% might die, they did not all do so by any means. This had been proven by Mr. R. D. Hume at his cannery at Rogue river. One season he had caught 50 male and 50 female salmon, removed the spawn and milt, notched the dorsal fins, and returned them to the water. The fishermen were instructed to look out for these marked fish, and next year 10 of them were caught. The following year several more were caught, and the year after five more found their way into the nets.

Some people suppose that because large quantities of dead fish are found on the banks of the McCloud river, that the salmon all die and never return to the ocean. The salmon, returning to the sea, float down the river, with their heads up stream, the current taking them down.

The U. S. Fish Commission had been taking California salmon eggs to the Eastern rivers for some 10 years, but not a California salmon had ever returned to one of these rivers, and none had ever been caught. When put in lakes or ponds they had matured, but were always of small size. No reason could be given why they did not return to the rivers from the sea. Prof. Baird was going to try it one year more, and if no better success followed, the project would be abandoned. By some it was supposed that because all our rivers flowed west, and the fish in returning to the rivers swim east, when they want to return they always swim east, and this

on the Atlantic coast takes them off the coast. Dr. Dall explained that on the Yukon river salmon are caught in "pots." The Indians construct barriers across the stream. On these are constructed, with strips of spruce, these compartments or traps, which are about as big around as a waste-paper basket. A flag is attached to a pole, and when a fish gets into the apartment, the flag is shaken, and the Indian paddles out his canoe and secures the fish. The fish are so thick at times that they can be kicked out of the small streams. In their journeys they injure their fins and scales on the stones, and then the fish fungus attaches itself, and the fish presents a most unpleasant appearance, turning all sorts of colors. They are all caught, when young, up the stream. He only knew of one instance when the fish were caught coming down.

The California Planer and Matcher.

We illustrate this week a machine which is very popular among the interior planing mills of the Pacific coast. It is a planer and matcher which has been built to meet the peculiar wants of mills on this coast.

It was first introduced to the mills of this coast by Berry & Place, of this city, some 10 years ago, since which date it has been improved from time to time, and changes made in accordance with suggestions of many mill-men who have used the machine.

Among its many advantages may be mentioned its four-slotted steel cylinder-head, its

A Season's Work in Alaska.

Dr. W. H. Dall, of the U. S. Coast Survey, well known for his scientific work in Alaska, passed this season, as usual, in the surveying schooner, *Yukon*, along the Alaskan coast. Since the party left San Francisco, they have sailed over 12 000 miles. At the last meeting of the California Academy of Sciences, Dr. Dall was asked to give a brief account of his summer's cruise. He stated that Dr. Bean had accompanied him this year for the purpose of devoting his entire time to making natural history collections, especially of fishes, in connection with the work of Prof. Jordan and Mr. Gilhert on the California and Oregon coast. He had found the common California brook trout on the Asiatic side of the Behring's straits, and had caught them in seines in salt water. They paid particular attention to the codfish and the haddock, and Dr. Bean became very confident that the Pacific codfish is the same as those caught in the Atlantic; and there is no reason why, in the course of time, with some care and attention, the Pacific codfish should not become as valuable and important upon this side of the continent as the Newfoundland fishes are upon the Atlantic.

They found some very interesting specimens, and some thought to belong to a new family. While there they learned that an individual had captured the original sea serpent. He gave a description of it, saying that it was 15 fathoms

it had ever been before. Previously they had had it down to four degrees below zero three or four times, but this season it had gone down to 12 degrees below. The spring was quite late, and this summer they had had a good average of sunny and of windy weather. In July it is usually very rainy, but this July, at the Seal islands, there was no rain at all; not a drop fell—a very unusual circumstance. Until their vessel approached the floating ice, they saw nothing like an Arctic climate, as the weather was so fine. There was no snow on shore, except here and there a little remained in a cleft in the mountains, while the land was covered with grass and flowers, which did not convey an Arctic appearance. This season has been a remarkably favorable one to the whalers. The whales have been very accommodating, coming out from their usual hiding places to the ice and allowing themselves to be killed. Not only did the whalers secure a full load, but they got out of the Arctic ocean before October, an event which has not happened during 20 years. The presence of the cutter up here had a beneficial effect in preventing the usual trading of liquor on the coast, and as a natural consequence, the natives have supplied themselves with food; in fact, everybody seemed to be happy up there. They boarded a whaler just cutting the eleventh whale, while the boats were on their way to capture another one. Something was said about chronometers, and they offered to regulate the captain's. He said that he did not know very much about the correct longitude, but he guessed he must be in the right longitude, for there were plenty of whales.

In the department of ethnology changes are found. It is now very difficult to procure any ethnological specimens. Very great changes have taken place in the habits of the natives. When he first visited the country, 16 years ago, the natives were attired in clothing made by themselves, and they used articles of their own manufacture. Now it is quite different, for they nearly all wear articles of civilized make, such as shirts, caps and trousers. Their old implements are becoming scarcer and scarcer.

Much damage has been done by foreign traders and smugglers furnishing the Indians with alcohol. Intoxicating liquor is exceedingly injurious to them, as, when supplied with it, they neglect to provide themselves in summer with a store of food for the winter. In the interior the natives seem to have decreased and deteriorated, partly on account of liquor, and partly on account of being furnished with fire-arms. Winchester rifles are more common there than here, and produce many deaths. Their Territory seems, however, to be improving, for now gardens are a prominent part of the establishment, and furnish potatoes of excellent quality and size. As far as the people are concerned, now, they all use the implements of civilization. The old-fashioned tools and implements are becoming very scarce. It is extremely difficult to obtain old-fashioned implements of their own make. When you do get them, they bear marks not of use, but of having been laid aside as superseded. The population is decreasing.

The Rise in Coal.

The sudden and somewhat unexpected rise in coal this week is a blow to the manufacturing interests, and is a hardship to all persons except dealers. Steam coal has gone from \$5 and \$5.50 up to \$8 and \$9 per ton. This is particularly hard on the steamboat and iron men, the foundries especially. It is said that freights have gone up a couple of dollars a ton, and the dealers have taken advantage of this and added a couple of dollars more. All kinds of coal have advanced, though the imported coals are more affected than the domestic. Black Diamond, Coos Bay and Nanaimo coals have advanced considerably. The *Call* says: The advance might be ascribed to many causes, but neither of them would naturally produce the marked appreciation in value of the past few days. At this time in the year coal usually shows an upward movement, and the natural advance has been assisted by the facts that at present the stock of coal on hand is about 200,000 tons less than usual at this time, and but few invoices being expected. The extension of the Southern Pacific railroad and the construction of branch roads have also helped to increase the demand. It is expected by those who should know that prices will further advance from 10% to 30%. Many persons deny that there is any scarcity of the article in the market, but attribute the unprecedented advance of prices to the establishment of a ring or combination of wholesale dealers in this city.

THE CALIFORNIA PLANER AND MATCHER.

patent expansion feed-gears, its adjustable pressure-bar, and its weighted roll in front of the cutter-head and patent chip-breaker.

A peculiar feature of this machine is the fact that the cylinder-head and feed-rolls raise so as to plane lumber six inches thick. As a general job machine for making rustic, flooring and for general planing it is considered perfect. The machines are built and for sale by the Berry & Place Machinery Co., 323 and 325 Market street, in this city, where they may be seen.

SIDE LINES OF MINING CLAIMS.—C. W. Bennett of Salt Lake has filed a complaint in the district court to quiet title to certain portions of what is known as the Emma ledge, Little Cottonwood. Notice was served that an application for an injunction will be made on Nov. 26th. This case will again bring up the question of side lines, decided once in the U. S. Supreme Court, in the case of Tarbet vs. The Flagstaff Mining Co., in October, 1878. The Flagstaff patent was secured across the ledge, and the Supreme Court decided that they were entitled to only that portion of the ledge within the side lines. Bennett claims that the Emma patent is across the ledge, and that his Cincinnati claim was made along the course of the vein. This suit creates considerable excitement in mining circles and will be fought hard on both sides.

THE Ontario Silver Mining Co., of Utah, has declared its 61st dividend (for the month of October), payable Nov. 15th, at Wells, Fargo & Co.'s. The payment of this dividend will make the total amount of the distributions to the stockholders \$3,050,000.

THE Pittsburg mine, American Fork, Utah, was shipping about 15 tons daily prior to the late storm. Not enough snow fell, however, to make raw-hiding profitable, and "more snow" is the cry at the Pittsburg.

THE October product of the Star mine was \$28,820.

long, and was provided with a beak, fins and other appendages. He did not have it with him, but explained that it had been sent to the city. After a parley it was agreed that it should be handed over to them upon returning. They were very anxious to secure such a specimen, and upon returning were chagrined to find it to be a worm, which is known to attain considerable dimensions, sometimes reaching 100 ft. upon the coast of Norway. The beak and fins, however, were not upon the specimen, nor anything not proper to the worm itself. Under the Department of Natural History they did considerable dredging, but did not secure much that was new, since Dr. Dall had previously dredged this coast very thoroughly on former expeditions.

They found a single specimen of the *Voluta*, named after R. E. C. Stearns, of the University of California. Up to this time only one specimen of this species had ever been found, and that had been procured from the stomach of a cod. This time they looked carefully, and were rewarded by finding another specimen of the shell.

In ornithology not very much was done, although they found a great number of specimens of described species. Dr. Dall said that some few years ago, when in Oxford, England, he had seen a specimen of a small snipe having a peculiar bill like that of a spoon-bill duck. It came from Sir John Barrows' collection, and its habitat was marked Behring's straits. Dr. Dall has frequently looked to get a specimen of this bird, the one at Oxford being the only one in a collection. This year they succeeded in getting one which was shot by an Indian. They afterward found, from the master of the steam whaler, *Mary and Helen*, that he had seen the birds at Pt. Barrow. This adds another to the list of American birds, there having been previously no specimen in any American collection. Among other birds found one or two may be new to science, and several others are certainly not common.

In meteorological science, all he could say was they had had a very queer season. Last winter the thermometer was lower in Sitka than

Mining in Calaveras County.

The Calaveras *Chronicle* says: Interest in mining operations continues without abatement, and the indications are that in the not distant future some heavy enterprises will be undertaken. It is a fact, plain enough to all who have any knowledge of the ground in this vicinity, that there are the best inducements for the investment of capital that are offered anywhere in the State. Of course it takes money, but with the right kind of men to manage things there is a certainty of making very remunerative investments. The ground has not been half worked and there are yet millions of dollars locked up in the gravel hills. The fact is being realized and the prospects of the mining interest are brightening every day. There is no doubt at all but that there will be some big enterprises undertaken shortly. It is gratifying to note the turn matters are taking in this industry, and we have good reasons for predicting better times. Most of the large hydraulic mines are not yet in activity, but are waiting for sufficient water to start up. Preparations are being made in all for the advent of water, and during the winter heavy work will be done. The Penobscot hydraulic claim on Tunnel ridge is not at present in operation, but is in readiness. The Bonanza hydraulic on the same ridge has been running without interruption all summer, and is paying property. The Mammoth claim has also kept up operations, and at present a new flume is being laid in order to wash off some gravel on the rim of the claim. An immense amount of work has been done in this mine during the year. In the Duryea claim the work of picking and carting the bottom gravel is completed. The water pipe has been taken up and tarred over, preparatory to hydraulicing. The Gleason mine will start next Monday, the hoisting works being completed, pipes laid and everything in readiness for pushing things briskly. The works were constructed by first-class workmen, and under the supervision of experienced miners. The works will be run by water power, for which they are admirably situated. The water conducted through pipe will have a pressure of 240 ft., which, when directed against a hurdy-gurdy wheel, will do the work like a charm. The incline tunnel is down already about 90 ft., the dirt being drawn out by means of a windlass, and it is calculated, when the works are started, to put on three shifts and reach pay dirt in a month or six weeks. In La Belle France the material used in the upper tunnel is being removed to the new lower tunnel, and a general cleaning made in the old works which will be abandoned. The company's large gulch flume has been moved farther down and in a few days a full force of men will be at work in the diggings. The Eureka hydraulic, on the Calaveras is not quite ready for running yet. A long, deep "cut" had to be dug in order to facilitate running off the gravel, and the rock through which the "cut" is run necessitates a great deal of blasting. It is now nearly completed, however, and most of the flume laid. The Eureka will be ready for operations soon.

Trueing by Blows.

Our machinists make a great mistake in using blows instead of pressure in straightening shafts or bars. Blows cannot be struck on cold bars of iron or steel without weakening them. It is a too common practice to take a long bar over the anvil and with sledge blows try to correct a crook while one, or perhaps both ends are unsupported. Every blow thus given extends its effects throughout the length of the bar, but concentrates its force at the point of the blow. If examinations were made it would be found that the after life of a bar so treated would be affected by the violence done to it at this anvil point. There are short crooks, sometimes, that require heroic treatment; they are too short to yield to bending. If the iron is soft, or the steel mild, this straightening can be made on the anvil, but in most cases it is well to heat the place where the crook occurs, and in all cases it is well to support both ends of the bar. A very ready and cheap device is a horse or horses, made like those the carpenters use and mounted on the castors so that the weight of the bar would induce motion either to or from the anvil. These horses should be of about this height of the anvil so that the bar would have a rest on the anvil and a rest on the horse.

The common way of allowing the bar to have its only bearing on the anvil is manifestly improper, as the suspended weight receives the full impact of the blow and is affected in its entire length. This result is to compel the impact of the straightening blow to lift the entire dependent weight of the bar, thus adding to the force of the blow the inertia of the bar. The result, it is apparent, is a terrible straining of the bar just at this point of the blow of the hammer.

It is better, where it is possible, to straighten bars by pressure. The railroad people use a straightener, which is simply a cam lever, while the bar is resting on supports on either side. Some concerns use a modification of this in their iron room, or forge shop, but a neat application of it would not be out of place in the machine shop, and would save the strain now

Wonderfully Rich Quartz.

For some time past quartz of extraordinary richness has been coming out of the quartz claim of Ford, McDonald & Mullen, on New York hill, adjoining the Rocky Bar mine on the west. This quartz has been boxed up and deposited in the vault of Judd's store, at Boston Ravine, to the number of 35 boxes, beside several hundred lbs. of large pieces, the total weight of all being over 2,000 lbs. Although there has been, from time to time, rock of great richness taken out in the Grass Valley district, we have never seen any equal to that contained in this collection. The late strike in the Rocky Bar was very rich, but this lot surpasses that, as some pieces of a few lbs. weight are of the value of \$300 and \$500. No accurate value has been made of this lot of rock, but it is believed that it is worth from \$25,000 to \$30,000. The specimens are truly magnificent, and are a surprise to the oldest and most experienced miners. Seven boxes of these specimens were brought up from the mine a few days ago, and more of the like character will be taken out at this next stripping of the ledge. It is intended to put the rock through the batteries in a short time, but there are several hundred lbs. of it which would be of more value to sell for jewelry than to reduce for bullion. The rock was taken out at a depth of 110 ft. from the surface. There has been sufficient development in the claim to prove that it is the richest spot of ground in California, as no piece of quartz ground has ever yielded as much gold from the same space, and there are no indications that the bonanza is near exhaustion; on the contrary, the latest developments are the richest that have yet been made. There is much gold in that immediate locality, as shown by the late strike in the Rocky Bar mine, and the regular and large yield of the New York Hill mine, which now pays regular monthly dividends. Beside these claims are those of the Vulcan, Grass Valley, Twilight and Tribute, all contiguous, and on the same rich belt, forming a set of claims that no doubt will all prove of great value. New York Hill and its surroundings, is now the point of the greatest interest in the Grass Valley district.—*Grass Valley Union*.

MILL CREEK.—A. Maestretti, formerly of Bodie, reports Mill Creek as thriving and prosperous. There are about 175 men at work and no idle men in the camp. Pete Tautphaus is putting up six arastras, and has now two furnaces completed. He will commence working on today from several mines. The May Lundy mill, of five stamps, is completed and running to its full capacity, crushing 10 tons of ore per day. There has been no clean-up as yet, but the pulp gives promise of a rich return. Andy Young has charge of the mill and is running it with his usual care, and his experience in working this class of ores ensures the perfect success of the mill. Townsend has deserted the editorial chair and is now running an arastra up Lake canyon. The May Lundy mine is being opened up with astounding rapidity. They have over 1,200 tons of rich ore at the mill. F. W. Pike, Superintendent of this mine, is doing scientific work in opening the levels and stopes. His confidence in this district is shown by his works, having just purchased the Lucky Morton and Lake View mines, which he proposes opening in the spring. There are now four mines opened and taking out ore—the Homer, Jackson, May Lundy and Little Emma. The Homer ore will be worked by Tautphaus' arastras with pans and settlers. Maestretti thinks Mill Creek will yet beat Bodie.—*Standard News*.

NEGLECTED.—While almost every other gravel-bearing section of Plumas is being prospected, and while locations are being made in almost every quarter, we can hear of but little being done toward opening the immense blue gravel channel which follows the course of the Middle Fork. The failure of the Franklin company to bottom it, seemed to put a damper on all other locations, and it has been dropped. It will not long be in this condition. There are unmistakable indications and evidences there of one of the most extensive channels in the mountains, and where it "slopped over" the rim at the Blue Gravel mine, it proved itself exceedingly rich. At no other point has the gravel been found, the immense river-bed being filled to a depth of 200 ft. and more with lava. Why don't some company test its merits with a boring machine, such as in use at Spanish Peak? The cost would be light, and a few holes bored to the bedrock would probably prove the existence of rich blue gravel, show the depth, and put the ground in shape to show to capitalists that an investment there would be a paying one. If that section of country had been located in Nevada or Sierra counties, it would have been bottomed and worked out years ago. Mile after mile of this channel is there waiting for some enterprising capitalist to prove that the bottom can be reached, and when that is demonstrated, there will be no trouble in finding owners for the numberless claims that will be located.—*Plumas National*.

ARIZONA has been specially honored of late by the visits of high officials. The President, Secretary of War, General of the Army and the Commanding General of the Department have all visited various points. From a private letter from Tucson, we learn that Gen. John C. Fremont, Governor of the Territory, had been for some days in Tucson. This is his first visit to the "ancient and honorable pueblo" for 31 years, at which time he came through there

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huern, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Hendrickson

on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by DEWEY &
CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Millman, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or-
der. It contains 120 diagrams, illustrating machinery
etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without
Quicksilver. 1880.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed full
of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country and in
Europe, and explains the why and wherefore.

It contains 155 pages, embracing illustrations of furnaces,
implements and working apparatus.

It is a work of great merit, by an author whose reputation
is unsurpassed in his specialty.

Price, \$3.00 coin, postage free.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Com-
parison; Manufacture, Care and Use of SAWS of all
kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris
Exposition of 1878.

This thorough work, impartially written in a clear, simple
and practical style, treats the Saw scientifically, analyzing
its action and work, and describing, under the leading classes
of Reciprocating and Continuous Acting Saws, the various
kinds of large and small hand, sash, Mulay, jig, drag, cir-
cular, cylinder and hand Saws, as now and formerly used for
crosscutting, ripping, scroll-cutting, and all other sawing
operations in wood, stone and metal, ice, ivory, etc., in this
country and abroad. With appendices concerning the details
of manufacture, setting, sawing, gumming, filing, etc., tables
of gauges, log measurements from 10 to 24 feet, and from 12
to 96 inches, lists of all U. S. Patents on Saws from 1790 to
1880, and other valuable information. Elegantly printed on
extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and
illustrations since first projected, the price is this date made
\$2.50, postage paid.

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia

March 10 1880.

9,454.—ONE FURNACE.—(Re-issue).—J. Winterburn, Cambria, Cal.
234,159.—CAR AXLE BOX.—C. M. and R. M. Wood, Healdsburg, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ORE-ROASTING FURNACE.—John Winterburn, Cambria, San Luis Obispo county, Cal. (Re-issue.) No. 9,454. Nov. 9, 1880. This invention relates to certain improvements in furnaces for roasting ores which contain volatile substances of value, such as ores of mercury. It consists in the introduction, above the fire-arches, of a prison-shaped deflector, which serves as a combined distributor for the ore and discharge pipe for the vapors which it leads into the condensers. It further consists in the use of a steam-pipe or passage which opens into the upper part of the furnace, leading thence into the condenser, and this pipe conducts away the steam arising from the drying of wet ore, so that no especial drying apparatus need be used previous to its introduction into the furnace.

CAR-AXLE BOX.—C. M. and R. M. Wood, Healdsburg, Sonoma county, Cal. Patented Nov. 9, 1880. No. 234,159. This device relates to certain improvements in car-axle boxes, and it consists in the employment, in such a box, of anti-friction rollers through which the weight of the car is supported upon the car-axle journal, the bearings for the axles of these supplemental rollers being supported radially from the center of the main axle. It further consists in providing for such an axle an elastic thrust-bearing, which will relieve the housings of the side wear and strain from the lateral movements of the cars when in motion. The lower housing is so fitted to the upper one, that it may be removed by simply taking out two bolts.

DRY-ORE WASHING MACHINE.—A. M. Denman, W. C. DuBois, C. C. Gee and F. C. Pettigrove, Oakland, Cal. Patented Nov. 9, 1880. No. 234,255. With this device auriferous earths of all kinds are treated successfully without the use of water, and tracts of gold-bearing soil remote from water supply may be utilized. The invention consists in a peculiar combination of sieves and pulverizers, with a fan-blower, and in certain details of construction whereby the particles of gold are separated from the earth to which they are found.

ANIMAL SHEARS.—Wm. V. Cruess, San Marcos, San Luis Obispo county, Cal. Patented Nov. 9, 1880. No. 234,250. The improvements here made in sheep shears consist in so arranging the spring which keeps the cutting blades apart, so that the said spring is made removable, and springs of greater or less strength may be used to suit different operators. Removable cutting blades are employed which are so secured that they may be removed when they become dull and sharp ones attached to the handles, thereby obviating the necessity of keeping a great many pairs of shears on hand.

SAYS THE BUTTE (W. T.) MINER: There has been a rumor in Glendale that the Hecla company has sold out for \$1,000,000. It has been understood that the above figure was the price at which the Hecla mines and works were to be sold, and it looks like a very small price for such a large concern. The Phenix sold for half a million in cash less than three years ago, when the deepest shaft was not over 70 ft. The Alta Montana mines at Wickes, with works similar to the Hecla, is stocked at \$5,000,000.

THE BALTIMORE AND OHIO R. R. is a profitable one. The gross earnings of the road last year were \$13,318,000; net earnings, \$7,937,000; increase over last year, \$4,124,000; increase in tonnage over half a million tons, and

An Improved Coffee Pot.

An engraving on this page represents the "Boss Coffee Pot." Its essential features consist of a peculiarly formed bag of a textile fabric, suitably expanded by a ring placed inside the coffee pot, this ring resting on the swedge of the pot. The coffee is finely ground, placed in the bag and hot water poured in upon it, dropping through into the bottom of the pot. The bag is made with a broad flat bottom, and does not come to a point, so that an effective straining surface is obtained.

This coffee pot has been extensively introduced throughout the East; and Mr. Ricker, the agent, has a large number of endorsements from various persons. He has only been in the city a few weeks, and is introducing the coffee pot here.

We were shown coffee made by ordinary boiling for five minutes; also made in a French coffee pot with wire-gauze cup; and then in this coffee pot with its cloth strainer. In each case a pint of water was used. That from the French coffee pot was comparatively weak; that which was boiled was muddy, while that made in the pot we are describing was stronger

and clearer, with a coffee taste and aroma. Another pint of water was added to the coffee made in the "Boss Coffee Pot," and even then the resultant decoction was apparently stronger than in the case of either of the others. This coffee was made very quickly. In fact, it is somewhat difficult to realize the difference in the three different ways described without seeing it made. Mr. Frank Ricker, at George H. Tay & Co.'s, southwest corner California and Davis streets, will take pleasure in showing any one interested the different ways of making coffee and the various results attained. The device is fully protected by three different patents. The great points made by the agent are economy in material and excellence of

The "Boss" Coffee Pot.

product. This device is highly endorsed by Geo. H. Tay & Co., C. J. Hawley & Co. and Bowen Bros., and can be procured at either of these places.

The Debris Dam on the Yuba.

An interesting report of the successful completion of the debris dam on the Yuba will be found on page 322 of the present issue. The following description of the manner of its construction, condensed from the Marysville Appeal, will be of interest to our readers: "The dam is located nine miles above Marysville, just at the beginning of the foothills. On the north side of the river is a bluff, from which the dam starts. The dam was built as follows, beginning first with the mattress: An excavation was made across the river, about one foot in depth and 60 ft. wide, the ground at that depth being very solid. In this were trenches in which were placed logs spliced together at the ends, and securely staked down. A mattress was then made upon an inclined scaffolding. Willow brush was laid upon the scaffold, butt ends and tops alternating so as to be close together and bind well. None but assorted straight willow brush was used. This mattress, about 60 ft. in width and two ft. in thickness, was then sewed together with strong wire until it was pressed to one foot in thickness. The frame or scaffold was drawn from under by horses, and the dense mass sank upon the strainers and was sewed down to them

mattress was necessarily made in pieces, these were all sewed together at the ends, making it continuous. This was all covered with two ft. of earth, and continued driving over it has packed the ground. This is intended to prevent the wash from the water that flows over or through the dam. On top of the mattress and earth, but a few ft. below the upper edge of it, begins a layer of logs laid together closely, sewed with wire, and sewed to mattresses beneath. On this are stringers and then two more layers of logs all with butts down stream and top ends running into the ground up stream. They were all secured in the same manner to the mass below and loaded with dirt. The line of the butt ends of each successive layer further up the stream, of course, forming a sort of stairway from the bottom. Upon top of the layers of logs are layers of brush rising in the same way. One end rises in a slanting way to the upper part of the dam, the other being buried in the earth up stream. The brush in these was also carefully selected, butts and tops alternating, and in being sewed was compressed by means of a pole used as a lever by five or six men, so close that a mouse could not creep through. Sand was then shoveled upon them until the crevices were filled, stringers were put on, and other layers added. There are in the dam, at the north end, five layers of logs and five of brush, besides the mattress and various lines of stringers and weights.

The length of the dam is nearly two miles, and it averages eight ft. in height. There is no part of it that is not firmly wired to every other part. Many of the willows used, it is thought, will send forth shoots to strengthen the dam. In all its parts the dam is a splendid piece of engineering. The work has been done thoroughly, and is highly creditable in every way to both contractors and engineers. It is claimed for the dam that when the water is at flood height it will slip through the dam and flow over it all along the crest at a depth of not more than one foot. The manner in which the layers of brush were sewed together is described as follows: The brush was placed on an inclined frame-work. Above stood workmen with long iron rods with a needle-like eye at the pointed end, the side of the eye being open. Into this eye the workmen passed the malleable wire; they then thrust it through the mass of brush, and workmen beneath them under the frame-work, seized the wire, pressed it aside from the needle and inserted willow toggles—sticks 18 inches long. The workmen above then drew back their needles and wire and pulling taut on the latter with their feet each side of the wire, the brush was of course drawn together and thus packed to a thickness of one ft. They then stepped forward two ft., sent down their wire threads again, other toggles were inserted, and thus regular stitches were made from side to side. In each mattress are three or four or five—according to size—of these lines of stitching.

A Popular Route.

We recently passed over the South Pacific Coast (narrow gauge railroad) via Alameda to Wright's station, near the summit of the Santa Cruz mountains. The road is very thoroughly constructed, and the management worthy of special commendation. In the "warm belt" at Los Gatos we find many improvements going forward in both town and country, stimulated, no doubt, by the new and very fair accommodations furnished by the building of the narrow gauge road. We found the Los Gatos hotel well filled with guests—a compliment to the thrifty town and landlord.

The new time table for the winter months went into effect November 7th, as follows: From San Francisco a daily train leaves at 8:15 A. M. for Santa Cruz and all intermediate stations, and at 4:30 P. M. a daily train leaves for Los Gatos and all intermediate stations. Every Sunday a through train leaves at 5 A. M. for Santa Cruz and all intermediate stations, for the accommodation of hunters, enabling a return to San Francisco by 5:35 P. M. the same day. The usual excursion, of round trip tickets, are sold at reduced rates, to San Jose and Santa Cruz and return, good from Saturday until Monday, inclusive. Alameda Ferry will leave San Francisco at 5:45, 6:45, 7:37, 8:48, 9:40, 10:38, 11:45 A. M., 12:35, 1:35, 2:35, 3:48, 5:35, 6:35, 9:30, and 10 P. M. (Sundays only, *daily, Sundays excepted.) An up town ticket office has been established at 208 Montgomery street, and a ticket office in Oakland, northeast corner of Thirteenth and Broadway.

COPPER IN PLANTS.—M. Dieulafoy reports the presence of copper in plants which grow on rocks belonging to the older geological formations. He says that plants growing in soil formed by the decomposition of primitive rocks contain such quantities of copper that it is possible to detect the copper in one grain of their ash by means of ammonia.

THE BLUE TENT GRAVEL M. CO., on Wednesday shipped \$25,000 in bullion, being the yield of their hydraulic claims for 13 days' run. The claims are supplied with water from the South Yuba Company's canal.

Work has been temporarily suspended on the Gahilan coal mine near Monterey, owing to a cave in the main tunnel. A recent assay of an average sample from this mine shows 60% of an

A FIRE at Mammoth City, Mono county, on Sunday, destroyed all the upper portion of the town, involving a loss of about \$45,000.

AT New Orleans the passenger depot of the New Orleans, St. Louis and Chicago railroad was burned, with two coaches. Loss, \$30,000.

REPORTS on the French beet crop class it among the worst as regards quality. Advances from Germany and parts of Austria are better.

HANLON beat Trickett in the sculling match on the Thames Monday. Hanlon's time was 26 minutes 12 seconds; Trickett's, 26 minutes 19 seconds.

THE arrival of the French monks at Alicante and Barcelona caused a hostile popular demonstration. They were compelled to re-embark from the latter place.

AT Lexington, Santa Clara county, on Monday, James A. Newell, aged 12 years, accidentally discharged a loaded gun, and instantly killed his sister Nellie, aged 7.

GENERAL ORD's report says that in western Texas parties of troops driving the hostile Indians have been frequently followed by surveyors locating railway routes.

JESE POMEROY, the Massachusetts boy murderer, has been foiled in an attempt to escape by sawing through a thick boiler casing with a saw improvised from a knife.

THE Jesuits have attempted to re-enter Portugal; the government has instituted vigorous efforts to strictly enforce the decree of 1834, abolishing all religious orders.

THE President has appointed ex-Secretary of the Treasury Boutwell counsel for the United States before the newly-organized Franco-American Mixed Claims Commission.

THE United States District Court for Western Pennsylvania has affirmed the right of the Western Union Telegraph Company to use the wires of the Baltimore and Ohio railroad.

IT is stated that a large amount of rifles have been introduced into Galway from the United States, and troops have been sent in that direction. Rifles are also said to have been shipped from Italy.

SECRETARY THOMPSON's omission to invite the Admiral, Vice-Admiral and other leading officers of the navy to the recent naval review off Fortress Monroe, has created a great stir in army and navy circles.

GENERAL SCHOFIELD, in his West Point report, recommends the retirement of colored men from the army in all its grades, but advises more care in appointments, for most of the colored men appointed cannot nearly pass the

In the Whole History of Medicine

No preparation has ever performed such marvelous cures, or maintained so wide a reputation, as **ATRA'S CHERRY PECTORAL**, which is recognized as the world's remedy for all diseases of the throat and lungs. Its long continued series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, by its timely use in the throat and chest disorder, of children, makes it an invaluable remedy to be kept always on hand in every house. No person can afford to be without it, and those who have once used it never will. From their knowledge of its composition and effects physicians use the **CHERRY PECTORAL** extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DEALERS.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive **DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY** Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the **MINING AND SCIENTIFIC PRESS** which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THE PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

DEWEY & CO.,

American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N.E. COR. FINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sales and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumber-
some Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuously. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Sump Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adapted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

SECURE PATENTS

Through Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

VOLUME XLI
Number 22.

Mineral Lands and School Sections.

The case of the Ivanhoe Mining Co. vs. Keystone Con. Mining Co. has been before the courts for some 10 years past. The company owning the Keystone has had it in possession for 10 years, buying it for \$106,000, and since they purchased the mine, it has paid over 150 dividends.

The controversy in the case related to the title of a certain tract of mineral land in Amador county, in this State, known as the eastern half of section 36, upon which is the town of Amador. The land in dispute is now, and has been for some years in possession of the Keystone Co., being held by them under a United States patent. The controversy was begun in the local land office at Sacramento, and was carried thence before the Land Commissioner at Washington, and appealed from him to the Secretary of the Interior. The adverse claimants, having failed at each successive step, the battle was renewed by a suit brought in the District Court. The case was transferred to the Federal Circuit Court, and finally reached the Supreme Court.

The Ivanhoe Co. claimed to hold the same land under a title from the State of California, founded upon a grant of land by Congress to that State for school purposes on March 3, 1853. As the decision of the case affects the title to other large tracts of mineral land included in grants made by Congress to the State of California, counsel of that State and the United States were allowed to participate in the argument.

The following is a text of the decision in the case, rendered this week:

The principal question at issue is whether the act of Congress of March 3rd, 1853, which granted to the State of California sections 16 and 36, vested the title of such lands absolutely in the State, without reference to their mineral or non-mineral character, or whether such lands were exempt from the operation of the school grant from the very fact that they were mineral lands. This Court, after an elaborate review of various acts of Congress bearing upon the case, including the act of March 3rd, 1853, under which the State and plaintiff in error claim title, expresses the opinion that it was the general and settled policy of Congress, after the discovery of precious metals in California, to reserve from sale and pre-emption entry, and to exempt from the operation of land-grant acts, all land known to be mineral in its character, and that there is no reason whatever to suspect that Congress intended to depart from this settled policy in the grant to the State of California of the sections now in controversy. It follows, therefore, from the findings of the Court below on undisputed facts of the case, that the land here in dispute, being mineral land, and well known to be so when the survey of it was made, did not pass to the State under the school section grant of 1853. It is equally clear in the opinion of this Court that the land in controversy is exempted from the grant under the provisions of the 7th section of the Act of 1853, for the reason that it was occupied, improved and under cultivation at the time the survey of it was made. Under such circumstances the title of the State, in the opinion of this Court, does not vest, but the alternative right to other land as indemnity, does. The settlement, building and cultivation, found as facts by the Circuit Court, bring the case within the provisions of the 7th section of the act of 1853, and necessarily renders void the title asserted under the State by the plaintiff in error. The judgment of the lower Court is affirmed with costs.

The opinion was delivered by Justice Miller. The gist of the decision is to the effect that the State had no right to take mineral land by virtue of its claim to school sections, and its patents to any such sections are invalid. This decision is a very important one and affects many large tracts of mineral land in this State. The Bodie mines are situated on a school section, and the same adverse claim has already been made to a number of the locations there.

The Hendy Ore Crusher.

The engraving on this page represents the "Hendy ore crusher," manufactured in this city by Joe H. Hendy. The machine is a very simple one, as the engraving shows. The outer jaw only moves, the inner being stationary. There is an eccentric in the shaft on each side

FIG. 1.—THE HENDY ORE FEEDER.

of the machine, and from these wrought-iron stays reach out and support the outer-swinging jaws, uniting on a cross bar. These stays are made adjustable by nuts.

It is very easy to get at this machine to change the shoes and dies. The side plates are removed and the lower outside unit elacked, which frees the swinging jaw. The jaw is then swung back over the top, leaving the stationary

Fig. 2.—"Section of Hendy Ore Feeder."

jaw accessible, while the swinging one is open above.

Any desired size of this machine is made. It is the cheapest crusher in the market. A great point is its simplicity. The motion is very light, but it gives great power. The machine is comparatively light, but it is so constructed as to be strong and durable.

At a depth of 600 ft. the Vancouver Coal Co., have reached an 11-ft. seam of excellent coal near the old workings.

Drill Holes.

There has been from time to time a good deal of grumbling about the use of diamond drills in mines. The trouble has been that the management have been able to find out more than they wanted to make public, and have, by the information gained, made piles of money at the

expense of other stockholders. The drill is a pretty good thing, however, for prospecting, if fairly used. It may be used to guard against water, too. A case of this kind is related by the *Virginia Enterprise* this week: "In order to guard against water, and to escape the trouble in which the Belcher and other mines of the Yellow Jacket group are now involved, the diamond drill will to-day be set up in the bottom of the Union shaft. A hole will be drilled to the depth of 200 feet, which will thoroughly inform the management in regard to the nature of the ground into which they are about to sink. In driving the shaft down without this precaution they are liable at almost any time to fire a blast that would be followed by a flow of water that would seriously inconvenience them, if it did not drive them out of their lower workings."

"The proposed drill hole will not only show what water there is in the track of the shaft, but will also make known the character of the ground to be passed through, and this being known a very close calculation can be made in regard to the length of time that will be required to sink the shaft to a given depth. Also, it is not impossible that the drill may cut something better than mere porphyry."

WORLD'S FAIR OF 1883.—The following rather curious item of news is telegraphed from New York as having appeared in the *Times* of that city: It is certain, however, that the business men of the city have not come to the front as promptly as they were expected to, and this fact is strongly corroborative of Judge Hilton's opinion, that the project in the present shape is not possible. It is freely charged that the Committee on Sites selected Central park for the purpose of exciting popular clamor against the fair, under cover of which they might wash their hands of the whole business. It is certain that the Park Commissioners will not consent to use Central park, and it is very doubtful whether they have the legal right to do so, even if they were inclined to yield to the demand of the United States Internal Commission.

The wild hemp on the Colorado river bottoms, in Arizona, is being worked successfully by Threlfall's ramie machine.

Cost of Dredging.

A somewhat remarkable fact is disclosed by the annual report of the California Harbor Commission. It is that a certain class of work can be done cheaper by the State than by private individuals. Not that there should be anything extraordinary in this, since the State wants to make no interest or profit, while the individual or the company does; but it seems somewhat strange to note the fact that public work is so economically done as to be less than that of private persons.

We allude to the cost of dredging in which a great reduction has been made in the past year, including every item of expense of wages of men, coal, repairs of tugs and dredgers, and ship chandlery, the cost per cubic yard of mud removed from the docks has been 6.89 cents against 7.16 cents the previous year, and 9.02 cents the year before that.

When it is recollected that the State need to pay 30 cents, 24 cents, 20 cents, and that when it got down to 14 cents per cubic yard, it was thought "dirt cheap," it will be seen that the Harbor Commissioners, by economical management, have created a revolution in the dredging business. Since the board was organized, it has spent \$622,075 for actual dredging, aside from the cost of construction, and repairs of tugs, dredgers, scows, etc.

It is noticeable, too, that this economical work is done with the old style of clam-shell dredger, and has not been accomplished by any intricate mechanical wonders, like some of the "improved" dredgers. In building dredgers, it seems as if inventors tried their best to get as much machinery as possible on to the scow. In fact, in one or two instances, additional scows have had to be called into service to float the machinery.

The old clam-shell seems to keep right on at its work, and needs few repairs, while more complicated machines are half the time in the machinist's hands. Inventors who have improved dredging appliances until they are so expensive to build and run that they are laid aside or ignored will do well to recognize the fact that simplicity in this bulky class of machinery is a most important factor. We have heard of no private dredgers of any style, which have accomplished its work as cheap as that done by the Harbor Commissioners. The tugs, dredgers, barges, etc., of the State appear to be kept in first-class order. They are always steadily at work winter and summer. The mud, though soft, has to be carried some distance. It is lifted from the elips between the wharves, deposited in the scows, which are carried by the tugs to the deep waters of the bay channel. This is kept up steadily, the mud being moved from the shoal places at the wharves to the ship channel. The advisability of this action is to be questioned, but, as yet, no effective means have been devised to lift the mud from scows and deposit it on land. When this can be done at a reasonable figure, it will of course be time to stop dumping mud in our ship channel. The swift current of the bay distributes the mud evenly, and the area is so large that, as yet, no bad effect has been experienced.

Whatever the means have been to accomplish the result of cheap dredging in this bay, our Commissioners should be complimented by the public on their success.

The entire controversy between the Iron silver mining company of Leadville and the owners of the claim on Iron hill was settled Saturday by a judgment in favor of the Iron company and by a compromise. In the case of the Iron mine against the Tucson, judgment was entered in the United States Court in favor of the Iron. In the case of the Iron mine against the Luella, which is now pending in the United States Supreme Court, a stipulation was made of confession of error, which will likely make the decision of that Court in favor of the Iron mine. In addition, the owners of the Luella and Tucson mines have made conveyances of their entire claim to the Iron company.

CON. VIRGINIA produced 1,161 tons of ore last week assaying \$16.25.

The Mining Counties.

There is bright promise of an industrial revival in the mining counties east of San Joaquin valley. The mining interest in Calaveras has been slowly advancing for several years, and the prospect to-day is more encouraging than at any time since the exodus of miners resulting from the general suspension of work in shallow placer diggings. During the past year many rich quartz veins have been discovered, and costly improvements have been made in many localities in the way of erecting the necessary buildings and machinery for operating the mines successfully. The quartz mining interest, however, is not by any means the only one exhibiting renewed vitality. Hydraulic mining is reviving, and the approaching winter promises encouraging results. The principal field of operation in hydraulic mining is confined within narrow limits. It is mainly along Chile gulch, extending only a few miles from Mokelumne Hill in a southerly direction. What are known as Chile hill, Stockton hill and Red hill, all in proximity to each other, embrace the principal hydraulic mines, although there are several in other sections of the county that are likely to prove bonanzas to their owners. There are large interests in the central and southern portions of the county, where considerable amounts of gold will doubtless be obtained during the winter months when the supply of water is abundant. In the neighborhoods of Calaveritas, Fourth Crossing, San Antonio, Dogtown, Angels, Albany Flat, Vallecito, Douglas and Murphys, placer mining is still pursued with profit to industrious men; but in the course of a few years quartz mining will in all probability transcend all other industrial pursuits in Calaveras. Fruit raising and farming are yearly growing in importance. For many years stock raising has been followed in a small but profitable way. Calaveras contains vast areas of good wheat land, but the cost of transportation will be likely to prevent anything like extensive ventures in that direction for years to come.

Calaveras and Tuolumne counties have produced some of the best fruit that has found its way to market in the populated centers of the State. In no State in the Union, or, perhaps, no country in the world, can the excellence of the pears produced in the orchards near Columbia and Sonora be surpassed. Fruit raising is an industry which is yet in its infancy in mining counties. In future years old Tuolumne will, in all probability, realize a greater annual revenue from her orchards than she has even done from her gold mines. With fruit growing, stock raising, quartz and placer mining, and farming on as large a scale as the situation and capacity of the soil will permit, the prediction that the prosperous days of old Tuolumne are yet to come, is one not unlikely to be verified before the children now attending the mountain schools become men and women.—*Stockton Independent*.

Silver Reef District.

Sufficient developments have been made in our mines, and ample time has elapsed since their discovery, we would think, to demonstrate to the most sceptical that our ore bodies are lasting and go to the deep; and still a state of semi-indifference seems to be apparent among our mining men and men of means in availing themselves of the rare opportunities presented for investment. While we have been modest in our pretensions, not desiring to heggle the public with the threadbare cry of "boom!" in every issue of the paper, we still have referred with pride to our weekly and monthly bullion shipments, and it is a doubt in our mind whether there is another silver district in the world where, with the same number of miners employed and of equal stamp capacity, such uniform and gratifying results have been or are now being attained. And with these accomplished facts before us, it is but natural to anticipate the great wealth that is yet to be revealed to those who have the energy and means to avail themselves of the opportunities here presented.

Take, for instance, the small area of ground being worked—and all is being worked that has as yet received any energetic development—and compare it with the undeveloped portion of the district in our immediate vicinity, and it is plain to be seen that it would be difficult in the extreme to over-estimate the future should we desire to do so. Within a radius of one mile there are scores of mineral locations, very many, if not all, of which are as likely to turn out rich-producing mines as those which are now returning their owners handsome profits regularly in the shape of dividends.

These advantages appear the more marked while contrasting our own prosperity with the condition of affairs in our less fortunate neighboring camps, all, or nearly all of which are suffering from the relapse caused by, over-coloring and untrustworthy representations, made by goggle-eyed experts and whisky-guzzling correspondents, in the wake of whom lie blasted hopes, ruined confidence, and the wreck of incorporations.

The recent developments in the several mines are alike gratifying to us all, proving as they do the stability and permanence of our mineral deposits, and nothing short of stupidity or mismanagement on the part of investors can prevent them from reaching the highest measure of success.—*Silver Reef Miner*.

The Little Chief and other mines at Leadville, Colorado, owing to fires in them, have been ordered to suspend work temporarily.

Mining Boarding Houses.

Complaints begin to come in from every mining camp around Salt Lake, of a custom that has lately grown up among mining Superintendents of compelling married men to board, and in several instances, sleep at the companies' boarding houses. A mining Superintendent who discharges a miner for living with his wife and children is very foolish. Because if not a fool, he should know that a miner who would willingly hoard away from his home and little ones and partake of the Chinese-cooked slops of the average "company" boarding house, is not worth the powder required to blow him into eternity. Knowing this, and still insisting on drumming up trade for the companies' boarding house, he must have a pecuniary interest in the proceeds. There is no other way to look at this thing. There are times when mining companies find it necessary to build boarding and sleeping houses for their men. But in all such cases there is no other accommodation to be had and the mine owners supply the men with food and lodging close to their work. The miners pay well for this accommodation, and are therefore under no obligations whatsoever. But a miner saves a few dollars and brings his family from the East or from across the ocean; he builds himself a little house close to the mine and is happy in the thought that when his day's work is over, he can sit at his own fireside, surrounded by the little ones, from whom he has been so long separated. His wife prepares the supper, cooking only the dishes she knows he likes best. After supper, his pipe lighted and his children at his knee, he forgets how hard and steadily he had to swing the hammer or the pick, the whole day long, in the happiness his well-earned money has brought to those loved ones around him.

Hard, indeed, must be his heart who would break up that happy circle. But the mining foreman is the god with a small, a very small g, who steps in and says: "Here the company has a boarding house and you must board there or quit the job. We can get men any day, and if you don't like our style of doing business, you may hunt elsewhere for work."

The poor miner looks about him and sees his family happy around the glowing hearth and then thinks of the Chinese cook and the hurriedly-prepared hash on fly-specked plates and he asks: "Have I not given satisfaction by my work? Have I not worked faithfully 10 hours a day and performed my task to your satisfaction?"

"Yes, that's all right. I don't find fault with your work, but you must board at the company's boarding house or quit; that's all."

Yes, that's all. And that miner is compelled to pay out of his scanty earnings \$1 per day for his own board, besides buying provisions and fuel for his family.

If miners will forward the names of Superintendents or foremen who run mines and boarding houses on the above plan, we will publish their names with pleasure.—*Salt Lake Tribune*.

LOW WATER.—The mountain rivers are now quite low, and because of the suspension of hydraulic mining in most of the claims, particularly on Bear river and its tributaries, the water is more clear in the streams than it has been seen in years. Bear river presents but a thin stream of water of a faint yellow color, that carries but little of the obnoxious debris, and where seen running over ripples actually shows "white caps," something very unusual to be seen in that turbid stream in years. Greenhorn, one of the Bear river tributaries, has dwindled down to a stream that can be jumped across, with the water having but just a suspicion of slickens in it. The South Yuba continues to run a considerable body of water, as the large hydraulic claims on the ridge, owing to the reserves of water held back in the reservoirs, are enabled to continue washing up to this time, but yet the volume of the stream is down to a low summer stage. The low water and the long continuance of dry weather, is serving a double purpose, in running but little debris to the valleys, and enabling the work upon the dams of the lower Yuba and Bear rivers to be pushed forward to successful completion before the advent of the rainy season. By the completion of these dams, according to the plans of the State Engineer, the coming winter will furnish a good test of their utility in holding back the debris, and demonstrate as to their value in helping to solve a vexed and troublesome question.—*Grass Valley Union*.

PREPARING FOR WINTER.—Snow falls to the depth of from 15 to 30 ft. in Jim Crow canyon, Sierra county. The boarding house of the Black Jack mining company is located at the brow of the hill, and a tunnel is being run that starts into the precipitous bluff over 400 ft. down toward the bottom of the gorge. It would be almost certain death for the miners to attempt to go back and forth on top of the snow from the boarding house to their work, for at any time an avalanche is likely to sweep down the hillside, snapping off the trees that stand in its way like pipe-stems and burying 100 ft. deep any living creature that may be carried along. As a safeguard, Superintendent Young is having a strong snow-shed built from the mouth of the tunnel up to within about 80 ft. of the boarding house, and terminating at another tunnel from which a shaft opens to the brow of the hill. Thus the employees can travel between the two points during the heaviest snow storms without inconvenience or danger.—*Nevada County Transcript*.

Winter Prospects at Bodie.

The *Bodie Free Press* says: We have taken some care during the past week or 10 days to inquire into the business prospects of Bodie for the coming winter, and find good reason to be encouraged, if not elated, at the outlook. The business of the town is in exact proportion to the activity and amount of work being done in the mines. Probably all, or nearly all the mines which will not run through the winter, have already closed down. These do not embrace any which have employed large numbers of men. The Syndicate, Bechtel, Standard, Tioga, Blackhawk, Bodie, Belvidere, Jupiter, South Bulwer, Champion, Addenda, Oro, the Noondays, Red Cloud, University, Goodshaw, Boston Con., Last Chance, South Bodie, Glyn-Dale, and probably Dudley and others, will work through till spring. In the mines which are merely prospecting, the working force has already been cut down as low as possible, so that no further reduction may be expected in that quarter. Every stamp in the district, comprising the 30 of the Noonday, 10 of the Spaulding, 20 of the Standard, 30 of the Standard-Bulwer, 20 of the Syndicate, 10 of the Bodie, and 4 at the Miners—124 in all—is at work and will continue to be supplied without a doubt until spring. The new Silver Hill mill of 10 stamps is expected to be completed and at work within two months, and the Noonday will have 10 additional stamps. The mills of themselves keep large numbers of men at work.

We do not think that the pay-rolls of the district will average less than \$200,000 per month throughout the winter. The fact that large numbers of unemployed men are leaving and have left the camp, cannot be considered in any other than a favorable light, so far as it relates to the commercial prosperity of the place. Men without resources are necessarily a burden to those who have employment. The closing of a few restaurants and small business places, where expenses are not being paid, can't do much harm, and the sooner we settle down to a proper number of business houses, dry goods stores, hotels, newspapers, saloons, restaurants, etc., the better it will be for those who quit and those who remain.

We do not think, however, that business will be any duller than it is now, and the chances—which are dependent upon a development in the mines—are in favor of greater activity. Our advice to the people of Bodie is to keep a stiff upper lip, live within your income, don't whine because you have lost a few dollars in stocks, which the chances are you have made here, work right along as though nothing had happened, and be sure that this will be a good business place for many years to come.

Esmeralda District.

The *Free Press* has heard from what it believes to be a reliable source, that developments have been made and negotiations are pending, which are likely to make Aurora a booming camp, if not this winter at least in the early spring. The recent sale to Seth and Dan Cook can be regarded as a most auspicious event for our neighboring district. Those gentlemen have had a wonderful degree of success in their mining investments of late years equalled by no other capitalists on the coast unless it be Haggin & Tevis. They are the principal owners in the Standard Con., the best gold mine to-day in the world, and have other fine properties in different sections of the country. Their success must of course be attributed to the good judgment which they exercise in the selection of properties. There are rumors current that since they have come in possession of the Prospect mine they have been drifting on a live-ft. seam of the ledge which will average \$200 or \$300 per ton. This is at a depth of less than 50 ft.; and should this rich body of ore continue for any great distance in length, and be found to go down, the property, which is now a magnificent prospect, will become a splendid mine. The past history of Aurora, which has a record of bullion production in the millions, all taken from within 100 ft. of the surface, is such as to justify the most sanguine expectations respecting its future. The Real del Monte has heretofore had the entire burden of prospecting, but is now receiving aid at different points in the district. The Centennial, Grand Trunk, Eva, Northern Belle, Humboldt and Humboldt West and other prominent mines are now showing up immense quantities of ore, some very high grade. The time will come when 500 stamps will not be too many to crush the paying ore from Aurora mines.

A DESERTED QUARTER.—The north end of Main street is growing more deserted and dreary every day. At one time—three years ago—that section was the flourishing part of Bodie, but the town has moved up and left it demoralized. The signs "for rent" or "for sale" are frequent, and the houses are falling into decay. What were one time handsome saloons are now old rookeries, covered with cobwebs, dust and gloom. Mining camps go up a canyon invariably, and this is one reason why the north end is now so deserted and uninviting. At the present time the lean and hungry coyote can wander through the back yards without molestation, and the tarantula and bat dance to their favorite music in the lonesome rooms. When Bodie booms again all these things will change, and the hand of prosperity will touch that "north end" and make it flourish like a family of white mice.—*Bodie Free Press*.

Mining Facts.

If mine owners and those interested indirectly in mining matters would remember that if they tell newspaper men only one-half truth and the rest lies, their properties cannot be truthfully represented in this paper. Writing up mining matters is something like handling a prickly pear, ticklish business on all sides. A reporter meets a mine owner just in from his mine. "How is everything going. Does the Flahool ledge hold out?" "The mine never looked better. We have 10 ft. of clean \$60-ore in the face, and getting bigger and richer every day we work on it."

This is important news, and a note is made of the item. An hour afterwards a miner taps the reporter and asks: "Did you hear the news? The Flahool vein pinched out and all hands quit work yesterday, and are holding the whim and buildings for our month's back pay."

Now, the skirmishing commences. Who told the truth, the miner or the owner? After a few hours tramping and searching, and prowling and inquiring, and, need it be said, praying, that miner owner is found playing stud-horse poker in some back room where no one but the grace of God and a reporter could discover. "There's that d—n reporter again. Well, see here, things are kind of mixed up there on the mine, but I want to keep the thing out of the papers. Won't you have a cigar?"

"But," the reporter replies, "what did you tell me a lie for? Why not tell the whole truth? The paper would be in a pretty fix stating a mine booming that had pinched out, and was attached by the miners for their wages."

"We will let it go." The great trouble with mining men is they think the bigger they try to make their mines appear on paper the better for them. This is a mistake. If a vein is a foot wide, no statement made in the papers can make it any wider. There should be a law regulating the manner of killing a liar, and if the *Tribune* had any voice in the matter, the punishment of a mining liar would be a trip through a Stedefeldt furnace.

Then there is the modest mine owner who wants to keep the facts from the public. He wishes to be let severely alone. Now, it is just as bad to understate a mine as to overstate facts, and that's the kind of modesty that has kept our reporter poor for years. He owns good mines, but he is too modest to lay the facts before the world.—*Salt Lake Tribune*.

Mineral and Agricultural Land.

The following circular relative to selection of agricultural lands or lands returned to Registers and Receivers by the Surveyor-General, as mineral, has been issued by the Commissioner of the General Land Office:

Registers and Receivers, U. S. D. L. Offices.—GENTLEMEN: Hereafter, in case of application being made in your office to enter or select as agricultural lands under act of Congress other than the pre-emption or homestead acts, lands returned as mineral by the Surveyor-General, you will require the applicant, at date of final proof of location or selection, to publish for 30 days a notice describing the land applied for, and giving time and place when such proof will be submitted or selection tendered. You will also put in your office a copy of the notice for the same period. Proof of the publication will consist of the affidavit of the publisher of the newspaper in which the notice was published, and you will furnish your own certificate as to posting in your office. The revocation of the withdrawals of lands as mineral by circular of April 27, 1880, was made, not only because said withdrawals had in many instances worked great hardship to settlers, but because it is required by law that homestead and pre-emption claimants shall publish notices of their intentions to make final proof on their entries, and this was thought to afford sufficient protection to all parties; but in case of entries under other laws, there is no such notice required. This precedence will apply to cases of application to enter under the townsite, desert land and timber culture laws; applications to select lands under grants to States, railroad and wagon road companies, and the location of the various classes of scrip upon lands which have been returned by the Surveyor General as mineral in character whereafter such publication of notice has been regularly made, no affidavits alleging the mineral character of the land having been filed with you, you will allow the entry, selection or location upon the filing of a proper non-mineral affidavit. If such mineral affidavit shall have been filed, you will proceed with a hearing as directed by the circular of April 27, 1880.

Very respectfully,

J. M. WILLIAMSON, Comr.

ASBESTOS POWDER.—Asbestos powder, made into a thick paste with liquid silicate of soda, is used with great advantage for making joints, fitting taps and connecting pipes, filling cracks, etc. It hardens very quickly, stands any heat and is steam tight.

The use of iron sleepers is becoming general in Germany. The Berg-Mark railway exchanges all the old worn out wooden sleepers for iron ones. Tenders were lately received by the Royal Prussian Railway Board for nearly 5,000 tons of iron sleepers.

A solid chunk of gold, oval in shape, weighing 66 ounces, and worth 1,200, was found in a tunnel at Sucker Flat, Placer county, a few days since.

MECHANICAL PROGRESS.

Welding Broken Spring Plates.

In our issue of October 2d, we gave some directions from the London *Coachmakers' Journal* for welding broken spring plates. A correspondent of the *Blacksmith and Wheelwright* gives his plan, which he considers "decidedly more practical." He says: "I first heat, upset and scarf the broken ends of the 'plate' (leaf we generally call it), just as if it were iron, and to be welded by separate sand heats; then place them in a clean fire and take separate box heats; heat as high as the safety of the steel will permit. I then let my helper take out one end while I take out the other, and when 'stuck' come on to it lively with the sledge, and nine times out of ten I get a good sound weld at the first heat. Care must be taken to leave it as 'heavy' at the weld as the original size of the steel.

The loss of length can generally be made good—if a "hed leaf"—by letting out, or taking up (as the case requires) the scroll at the end of the bottom "hed leaf," or, if it is an outside or intermediate leaf, the little loss in length is of no importance.

Now the welded end of the "leaf" must be tempered—a spring temper—or, no matter how perfect the weld, it will not prove a good job. Tempering properly is the most important feature of the job, and the fact that the majority of smiths overlook it altogether is the reason that our patrons have universally come to say:

"A spring that is once broken is never much account after; I'd much rather pay for a new leaf, if you can make one, than be bothered with it."

Since I have learned through my own observation the importance of tempering, I seldom weld a spring which fails to stand as well as its fellows.

Glass as a Building Material.

We lately entertained our readers about ties of tempered glass for railroads, obtained by Siemens's method. A new application of this method has been pointed out to us which would have appeared incredible at the time when glass was only known in its primitive condition as a crystalline product, with sharp, broken edges, yet fragile and unresisting to shocks and pressure. Tempered glass can be obtained in great pieces, gifted with a power of resistance which its specific lightness, compared with heavy metals, would not have given the least presumption. It can now be employed, notably in carpentry, for posts, joists, ties and buttresses. It combines the advantages of strength and of incorruptibility in contact with all atmospheric agents, as well as with chemical factors, and consequently, is of perpetual duration. Besides these advantages, another is the smallness of the price of acquisition. This material is now as cheap as iron of the same weight, and as a large sale is counted on, it will not be long before the reduction of price will be below the cost of wood. No doubt many industries will profit from this new progress in the fabrication of glass, and it will be greatly appreciated in the household. One will see the time when the metals and wood will be replaced by glass in a great number of implements, utensils, and objects of diverse nature, such as stop-cocks, gutter-spouts, buckets, and even barrels.—*Manufacturer and Builder*.

LONG RUN WITHOUT REPAIRS.—Passenger engine No. 273, on the Pennsylvania road, was built at the Altoona shops and turned out on the road in 1875, with Mr. Sol. Hoffmeister as engineer. She weighs 75,500 lbs., and has five-ft. driving wheels. About nine weeks ago the engine was placed, for the first time, in the shop for repairs, having been in continual use 49 months, and in that time has run 251,552 miles, and is now in the Middle Division round house ready for the road once more, looking as good as new. Mr. Hoffmeister has the credit for all the mileage made by the engine in the past four years, and the wonderful amount of work performed by it speaks well for the care he has displayed of the machine, as well as the excellent workmanship of the machinists and other workmen engaged in the construction of locomotives.—*Pittsburg Telegraph*, Oct. 29th.

AN IMPROVED PROPELLER.—An invention which is attracting considerable attention among shipbuilders in England is the De Bay propeller, which, there is every ground for believing, will considerably reduce the enormous waste of power of the screw now so generally adopted for the propulsion of steam vessels, although the loss of power is from 40% to 50%. The propeller consists of two screws, which are revolved in contrary directions. The two screws are mounted on shafts, of which the one revolves within the other, the one screw having three blades, while the other has four. These are of peculiar shape, being so formed that each blade has projections where the other has depressions. A steamer, the *Cora Maria*, was fitted with the propeller, and it was found that while she steamed 8.73 knots with an ordinary screw, her speed was 11.23 knots, a saving of 29.2%, with practically the same expenditure of power.—*Iron*.

Air Locomotive for Street Railroads.

English papers give an account of an air locomotive designed by Major Beaumont, of the Royal Engineers. From an account of an experiment made at Woolwich, some points may be gathered useful in subterranean street railroad communication in cities. The engine, having received a charge of 100 cubic ft. of air, with a pressure of 1,000 lbs. to the square inch, left the Royal Arsenal station, on Oct. 6th, at 12:22 p. m., for a run to Dartford and back, about 16 miles. In order to increase the energy of the air, it was heated, on being admitted to the cylinder, by a very small quantity of steam. The indications on the pressure-gauge, as different stations were passed, were 940 lbs. at 12:27 p. m.; 800 lbs. at 12:33; and 760 lbs.; 540 lbs. pressure being the store of energy on arriving at Dartford at 12:50. Wasto having been occasioned by shunting, the return journey began with a pressure of 510 lbs. at 1:35 p. m., and Plumstead station was again reached at 2:10. This locomotive, not so large as one of our common street cars, weighs about 10 tons, and draws a load of 16 tons up a moderate incline. It can be charged with air in 15 minutes, does not send out any rush of steam or noxious gases, and makes only a trifling noise. Its sanitary advantages for underground work are obvious, and it can also be used for surface roads. Major Beaumont calculates that one on this principle, but weighing about 50 tons, would be the most powerful of traction motors.

FIRE-RESISTING QUALITIES OF BUILDING STONE.—Doctor Cutting, State Geologist of Vermont, has concluded his unique series of tests on the fire-resisting qualities of building stones. He sums up the result in the current number of the *Weekly Underwriter*. He declares, in substance, that no known natural stone deserves the name fire-proof. Conglomerates and slates have "no capacity" of standing heat; granite is injured beyond cheap or easy repair by even so mild a heat as that which melts lead; sandstones, including the variety called brownstone in this city, are better, and limestones and marbles are perhaps the best in this respect. But even they are injured by continuous heat of 900°, and at 1,200° are changed into quicklime. Therefore, it would seem that no stone buildings are fire-proof, and some of them, Dr. Cutting even says, are as much damaged by fire as wooden structures are. Brick, on the contrary, is usually uninjured, and is often rather improved by heat until it is melted. But as most brick buildings are either trimmed with iron or stone, the damage is often considerable, even when the walls stand. To avoid this, Dr. Cutting recommends soapstone trimmings, which are open only to the objection of expense. But although brick stands heat so well, it is objectionable, because its power to resist pressure without crumbling from dampness or frost, is less than that of stone. Nevertheless, as brick is only a kind of artificial stone, the search for an ideal building material is not hopeless, but it must be prosecuted rather by the maker than by the quarrier of stone.

THE BOLLEE STEAM COACH.—A steam coach is attracting considerable attention in the streets of Berlin, where it has been extensively experimented with. It is built according to the system of Bollee, an engineer from Le Mans, France, and in its present shape is intended for passenger service only. It has but two pairs of wheels, of which the back pair are the driving wheels, while the front pair is under control of the driver. The boiler is one of the Field type, made of sheet copper, and capable of resisting a pressure of 150 lbs. per square inch. The boiler is mounted on a platform, upon which the engine proper is placed, and which the stoker occupies. The driver has an elevated position in front of the carriage, and the reversing levers, steering gear and throttle-valve lever are within easy reach of him. Between the two pairs of wheels is the body of the coach, capable of accommodating six passengers. It has been found by trial that this coach can make 12 miles per hour on good pavement, and 18 miles on an asphalt or macadamized road. Though the promoters of the enterprise appear to be sanguine of success, there seems little hope that even in Germany the steam coach will conquer a place in modern means of travel.

THE PHILOSOPHY OF WELDING.—If iron were similar to other bodies, and a blow or sudden pressure produced heat all through the mass, the unexpanded liquid at the surface, as well as the interior plastic iron already expanded, would rise in temperature, the consequence of which would be that the molecular conditions at the junctions would still differ, although both at a higher temperature, and, therefore, molecular union could not take place. But if the liquid iron at the surface of the weld is in that condition of temperature that it would cool by pressure, the result is different, as the blow or pressure acts on the plastic iron to produce heat, and on the surface iron—which is on the border-land between liquidity and plasticity—to produce cold; consequently there is a moment when the temperatures of the two would meet each other and render the molecular condition of the junction uniform and continuous. This appears to be a satisfactory explanation of the wonderful property of welding iron, and its counterpart in ice is the interesting phenomenon of regelation." *L'Ingenieur*.

SCIENTIFIC PROGRESS.

Something New About the Formation of Dew.

We are all familiar with the bright, transparent beads of water formed upon grass and other kinds of vegetation during the clear and still nights of summer and autumn. This water is known as "dew," and the generally received theory of its formation was first clearly set forth by Dr. W. C. Wells, a physician of London, in his famous "Essay on Dew" first published in 1814. This essay still continues to be the standard authority on the subject, and, so far as the writer is aware, nothing further new or of special interest in this connection has found its way into any standard publication up to the present time.

Dr. Wells's theory, as is well known, sets forth that dew is a deposit of invisible moisture from the atmosphere upon the surfaces, the temperature of which is lower than that of the surrounding atmosphere. The deposit formed in a warm day upon the outer surface of a pitcher of cold water is due to the same law. But now comes Mr. J. U. Lloyd, with a series of articles in the *Christian Standard*, of Cincinnati, commencing with July 24, 1880, in which he admits that the idea is beautiful and the theory true to a certain extent, but denies that all the moisture thus observed is derived from the atmosphere. He holds that there are two kinds of dew, derived from entirely unlike sources, and which, when separately collected, show entirely different chemical characteristics. The one, when deposited from a pure atmosphere, is almost pure water, while the other, although collected from vegetation exposed in the same field and to the same atmosphere as the first, contains so large an amount of sugar (glucose) as, in some instances, to be quite perceptible to the taste.

Mr. Lloyd says he had noticed that on certain species of grass, dew is found in the evening in drobs upon the tip end of each thrifty blade, before the remainder of the blade is moistened, and before there is moisture upon the surface generally of any vegetation in the vicinity; that these drops are continually falling off, from their accumulating weight, and are constantly being replaced by other drops at the same point. It was evident that these drops were not condensed from the atmosphere. He noticed that while one species first shows the drop upon the tip of the blade, others were covered with heads of moisture simultaneously along the entire edge of the blades, while still other herbs and leaves remain perfectly dry or exuded moisture from their entire surface. He asks, "can this variation be explained by any law of radiation?" and answers the question in the negative. He argues, both from observation and reason, that dew proper is deposited from the atmosphere, according to Dr. Wells's theory, but that the drops formed at the tips and edges of certain grass blades and leaves, as above, are exuded from the plants. The sugar found in such drops is the surplus of that which is formed in the upward passage of the fluid, and which, not being appropriated by the plant, goes to waste in solution with the exuded water. Hence the familiar fact that cattle prefer grass which is or has recently been, wet with dew (exuded moisture)—it is sweeter than that which is more dry.

The term, "honey dew," is frequently applied to a moisture which sometimes attracts bees and other insects by its peculiar sweetness. There seems to be a great difference in the amount of water exuded by different plants. "Blue grass" is especially noticeable for the rapid formation of drops on the tips of its leaves. The plant commonly known as the "Indian turnip," the large-leaved species of *Caladium*, or "Elephant's ear," etc., are also specially noticeable. He also holds that this excreted dew is greater in quantity than that which is condensed from the atmosphere.

The philosophy of this exudation may be condensed from one of the Doctor's papers, as follows: The rootlets of each clump of grass, or of each shrub or bush, are constantly absorbing from the earth water charged with such mineral ingredients as are needed for the growth of the plant, and the grass blades and leaves are continually exhaling the surplus water into the atmosphere. The cells of the plants seize upon the nutritive principles, appropriating them to their support and growth. The surplus, or depleted water, escapes, in the day time by insensible evaporation, but during the night, when but little or no evaporation takes place, this moisture accumulates upon the leaf surfaces, and becomes visible. In some plants it exudes mainly from a few comparatively large microscopic openings [in the tips of the leaves, as in blue grass; from others along the edges; from others still, evenly over the entire surface. The latter, for evident reasons, is more generally confined to wooded plants, with leaves and branches. These deductions, the Doctor avers, are the result of extended observations, sometimes carefully conducted with chloride of calcium and bell glasses, and by other means. The question here raised is certainly a very interesting one, and will no doubt be speedily confirmed or exploded. It is given in these columns for what it is worth, as an interesting item in the progress of scientific investigation.—*Californian* for December.

Dangers of the Electric Light.

Now that the electric light is coming into quite general use, it is proper that the public should be warned against the dangers incident to its use. Ladies who value their complexion should not approach an open light of any considerable power too closely, or expose themselves to it for any length of time, as the effect is very likely to be similar to that of walking for hours in a July sun. But a far more serious danger is that which comes from a careless handling of the wires by which the electricity is conveyed. Quite recently a man on board the steam yacht *Livadia* was asked to support an electric lamp temporarily while arrangements were being completed for hoisting it to its position, and by mistake placed his hand in such a position as to divert the current from the candle through his body. He was killed instantaneously.

Another source of danger has been found in the liability of a contact of wires by which a powerful light current may be suddenly transferred to a telegraph or telephone circuit, as recently occurred in New York, in consequence of which a telephone instrument and its surroundings were suddenly set on fire, to the great danger of the entire building and its contents.

DIGESTION IN CERTAIN PLANTS.—Dr. Lawson Tait has recently investigated afresh the digestive principle of plants. While he has obtained complete proof of a digestive process in cephalotus, nepenthes, dionaea and the droseraceae, he entirely failed with *sarracenia* and *darlingtonia*. The fluid separated from the droseraceae he found to contain two substances, to which he gives the names "droserin" and "azarin." Dr. Tait confirms Sir J. D. Hooker's statement that the fluid removed from the living pitcher of nepenthes into a glass vessel does not digest. A series of experiments led him to the conclusion that the acid must resemble lactic acid, at least in its properties. The glands in the pitcher of nepenthes he states to be quite analogous to the peptic follicles of the human stomach; and when the process of digestion is conducted with albumen, the products are exactly the same as when pepsin is engaged. The results give the same reactions with reagents, especially the characteristic violet with oxide of copper and potash, and there can be no doubt that they are pepsin.

TRANSFORMING SOUND INTO LIGHT.—M. Treve has described to the French Academy of Sciences an experiment with an apparatus which he calls a singing condenser, by which he believes he effects the transformation of sound into light. When a current of electricity is brought to bear upon his condenser a sound is produced, which he attributes to the vibrations of the air in the condenser, produced by the shock of the electric current. Reversing this experiment, he placed the condenser in a Geissler tube, and brought the two poles of the electric current to bear upon the condenser through the electrodes of the tube. The tube was then connected with an air-pump. The condenser sounded as usual when the current was directed to it under the ordinary atmospheric pressure; but when the air was withdrawn the sound became more and more feeble, until, as a vacuum was produced, it ceased entirely, and a clear, bright light appeared, sparkling like pearls, from the leaves of the condenser, quite unlike the ordinary pale, vague light of the Geissler tubes.—*Californian* for December.

COPPER IN PLANTS.—It has generally been held that metallic substances impregnating the soil were not absorbed by plants; that the roots possessed a species of selective power in virtue of which they rejected everything of an injurious nature. This is not strictly true, since there are exceptions to the rule. The ashes of a species of violet (*Viola calaminaria*), which flourishes on the waste or heaps of certain of the zinc mines of Rhein Prussia, have been found to contain considerable quantities of zinc. Mr. Dieulafoy, a noted French mineralogist, now adds his testimony to the inaccuracy of this opinion, by proving the presence of copper in plants which grow on rocks belonging to the copper-bearing series. In some instances he was able to obtain a distinct reaction for copper with ammonia in one grain of ash. It is not improbable that investigation would disclose the fact that other metals are also taken up by plants.

OZONE IN THE ATMOSPHERE.—Hert E. Schone contends that the presence of ozone in the atmosphere is by no means proven, although it has been shown that hydrogen dioxide is in the air. Iodine potassium paper is entirely unfit for use in determining the presence of ozone, as its coloring is dependent upon the moisture in the air. Thallium paper is not thus influenced. It is prepared by pouring a solution of sulphate of thallium into a boiling solution of barium hydroxide. The solution of thallium thus obtained is used to soak filter paper. According to Schone's investigation the intensity of the coloring of this paper by the formation of a brown oxide has corresponded with the percentage of hydrogen dioxide in the air.

The Silver Reef Miner, of Utah, says: The problem of how to successfully work the hundreds of thousands of tons of low grade ores which are exposed and known to exist in this district, is, we are happy to state, probably approaching a solution. Already the attention of capital is being directed to this question, and it may not be long before the desideratum so devoutly wished for by the numerous owners of low grade mines will be an accomplished

The Mining Share Market.

Stocks continue dull. The prospective flood of water in some of the big Comstock mines is discouraging to brokers as well as to miners. The only noticeable feature of the week has been Alta, in the lower levels of which it is hoped a bonanza will be uncovered. The Enterprise says it is quite certain that the Alta folks have cut some good ore with

vein—which is considered the extension north of the Bechtel lode, and extends from the Bechtel line north to the face of the bluff. The new Silver Hill mill is rapidly approaching completion, and all the other mills in the district, comprising 124 stamps, are at work constantly. Improvements are reported in the Champion, Con. Pacific and Boston Con.

NEVADA.

TAPPED A GOOD LODE.—*Transcript*, Nov. 17: The parties engaged in running a tunnel on the Homestead claim, on Myers' ravine, are said to have tapped a 2-ft. ledge of very good ore.

HAD TO STOP HOISTING.—Owing to a failure of the water supply, prospecting has been stopped on Kirkham & Hitchcock's quartz bonanza, at Blue Tent. Work will be resumed with redoubled vigor as soon as a good rainstorm comes. The boys talk of putting up steam power on their claim soon.

ANOTHER RICH STRIKE OF QUARTZ was made yesterday on Red hill, about a mile below this city. A chunk of the rock was shown us, which was profusely decorated with gold. The lucky finders are named Murphy and Underwood.

THE FORTUNA MINE.—It was expected that arrangements would have been made before this for the resumption of work on the Fortuna mine. Over a month ago, Gen. O. H. Lagrange, one of the owners, went to New York for the purpose. He had scarcely reached there, however, before he was recalled to San Francisco by a telegraphic dispatch stating that his wife was taken seriously ill. He immediately returned, but before reaching home, she died. This unfortunate occurrence interfered with his plans for several weeks. Last Tuesday he again left San Francisco for New York, and as soon as the matter is laid before the stockholders it is believed that orders will be given for starting the pumps and sinking the shaft to greater depth. The Fortuna company is composed of reliable men, and unlike a number of mining corporations who have eluded our merchants by running large hills and not paying them, they have always paid their indebtedness promptly every month. It is to be hoped that work will be resumed on the Fortuna at an early day.

THE MOUNTAIN MINE.—*Herald*, Nov. 13: The Mountain mining company has been able to have a 10-stamp mill erected on their property below Deer creek. Work has already been commenced and it is expected to have the mill completed and ready for crushing in a very short period.

THE BUELOW MINE.—A 10 stamp mill is being placed at the Buelow mine, situated on the South Yuba. This quartz claim promises to be a valuable piece of property, as it has a ledge about 13 in thickness and is good paying ore. As soon as the mill is put in operation, the mine will then double make a good showing.

THE DEADWOOD.—The Deadwood mine, situated in the district of Willow Valley, is again booming up. The pay chute, which gave out nearly one year ago, was again struck yesterday after the company expending nearly \$18,000 to find it. The ledge is 2 ft thick, and is a fine paying rock. The ore crushed during the past 10 months did not pay expenses. The cause of the pay chute being lost was owing to a mistake in the formation of the ground. The tunnel is now in 430 ft, and the prospects are excellent. The company will commence to crush next Saturday.

PLACER.

STILL FINDING THEM.—*Placer Herald*, Nov. 20: We learn from parties recently from Iowa Hill that Weske's drift claim on Sucker flat, which produced the \$1,200 chunk lately mentioned in the *Herald*, continues to turn out some fine specimens. Last week a chunk weighing 7 ounces was picked up in the claim, and this week another was found that weighed 9 ounces. The Almatina mine, which has been started up lately, is paying again, we understand, better than ever.

HUMBOLDT QUARTZ MINES.—*Dutch Flat Forum*, Nov. 20: There is but little being done over in the Humboldt mines at the present time from the fact that the water supply has about given out. The miners in that section, as almost everywhere else, are anxiously awaiting the rainy season. The Poole quartz mill is not being run more than 3 or 4 hours in every 24, the water being so low that they cannot run longer. The very first good shower of rain will give them an abundant supply and enable them to keep the mill running night and day. There is quite a large amount of ore ready for crushing in the Poole mine, and something like 150 tons of fine ore taken from the Boss mine now at the mill, which will be put through as soon as the water supply is increased by the rain. This lot of ore from the Boss mine is to be run through the Poole mill, and will be a practical test of the richness of the ore. All the assays heretofore made have given good prospects, and are confidently expected by the owners of the Boss that this test lot of ore will surprise everyone with a large yield of gold. There is but little being done on the Dorer ledge for the reason above—scarcity of water. The other many new claims in that locality are being prospected continually.

Dewey.—Work in the Dewey mine is progressing finely. They propose to commence hydraulicking as soon as the necessary arrangements have been completed. A large lot of hydraulic piping has been taken over to the mine from Dutch Flat during the past few days.

The cement mill, at the New Gold Run mine, is being run to its fullest capacity, crushing a fine lot of gold-bearing cement and gravel. The water supply is running low and it is feared the mill will have to shut down if it does not rain soon. A full force of men is employed in this mine.

ABOVE MICHAEL BLUFF.—*Placer Argus*, Nov. 20: The Golden Fleecy tunnel is now in 1,625 ft. A double shift will continue working in the mine all winter provided there is water enough with which to run the overshot wheel which runs the hoister and furnishes a supply of ventilating air. The shaft of the new Basel Con., otherwise known as the claim, is down about 170 ft. The mine adjoins the Golden Fleecy on the rear. In the creek claim, which is above the Golden Fleecy, gravel has lately been struck. All the ground between the Damascus and Golden Fleeces mines has been taken up by Messrs. Schneider, Mitchell & Hobson. This is one of the many evidences that the prospects of that section are flattering. Snow is the only drawback to that section.

PLUMAS.

THE BELL MINE.—*Plumas National*, Nov. 22: Mr. R. W. Stewart and Mr. T. G. Cragin, two of the stockholders of the Bell mine, at Elizabethtown, have been inspecting the property for several days. It is rumored that work will start up on the shaft, and that the mine will be thoroughly prospected at a much greater depth than ever before, and that the Jackass mine will also be developed.

THE MONTE CHRISTO.—On Sunday last we passed an hour or two at the Monte Christo mine on Spanish peak, and through the politeness of Supt. Smith and the foreman, Mr. Mahoney, were shown over the property. The new hoisting house is about completed. The scores are all in for a 9 months' siege, and the work is well advanced for the winter arrangements. The new building for the company's office and store-house is completed. The work in the mine is going on satisfactorily, and every crescent and shaft more thoroughly proves the value of the property. A hauling for the engine has been put in place, and will be at work in a very few days. A large Burleigh drill is also being fitted up. The main tunnel is to be run ahead several hundred ft this winter, and it is calculated that room for a large force of miners will be made by spring. The developments lately made show that the rich lode gravel is plentiful, and all that is necessary is time to open it up and put it in a shape to handle rapidly. This winter will be devoted to that purpose.

SIERRA.

GRASS FLAT.—*Mountain Messenger*, Nov. 20: B. F. Baker has cleaned Grass flat as clean as a base-hall ground, every stump and tree taken off. All hands are now at work on the incline.

SHUT DOWN.—The hydraulic diggings at Logansville have all shut down, owing to the cold weather freezing up the water.

READY.—The miners at Eureka are all ready for water, which seems slow in coming.

MORRISTOWN.—Supt. Wheeler, of Morristown diggings, has about 80 white men and 60 Chinamen at work fitting up a shaft in this spring. He is enlarging the main ditch, and extending the water to Craig's flat to commence at the lowest point and work up.

UP-RIVER NOTES.—*Cor. Mountain Messenger*, Nov. 20: The Eureka Con. Co. are now in 230 ft with their tunnel, working 4 men. A new contract of 100 ft has just been let, at \$3.50 per ft, to Dorsey, Leary & Quinn. Formation, blue cement. Last Chance Co. are running a bed-rock tunnel, Williams & Nichols, contractors. They are now in about 300 ft. Savage mine has been closed for the winter, water being all frozen. The recent fire only destroyed the old stable and cabin at the shaft, together with a horse, owing to the rapid progress of the conflagration. The engine house was saved by unceasing exertions all through the night of those in charge of the mine. Supt. O. B. Stevens has gone to Virginia City to arrange for resumption of operations in the spring. Eintracht Gravel M. Co. has shut down for the winter. Phoenix Co. have struck quartz that averages \$30 to the ton. The chimney developed is 250 ft long, and ledge is from 3 to 6 ft wide. Rising Sun Co., Logansville, are extending the South Branch Water Co.'s ditch to their claims, and will be ready for work next week. Haskell Peak Co. is in 80 ft, sinking for bedrock. Blue Oravel Co. is in 200 ft in fine looking gravel, half of which is washed quartz. 1,001 Co. is in good paying gravel, but have no water. I saw a prospect of \$1.25 worth of gold, washed out of a pan of gravel.

NEVADA.

WASHOE DISTRICT.

MINING NOTES.—*Virginia Enterprise*, Nov. 20: At the Union Con. mine a drift is being run east from the bottom of winze No. 1, on the 2600 level, to give room for working the diamond drill. A space of about 22 ft is required for the drill, and for the drawing of the rods. The water at the bottom of the winze remains about the same. As soon as this drill chamber is completed a hole will be drilled to the eastward, in which direction it is expected the water will be found. West crescent No. 1, on the 2500 level, is cutting streaks of quartz assaying from \$1 to \$30. The indications are that no solid body of ore of any considerable width will be found at this point.

At the Sierra Nevada the work is still confined to the southern parts of the mine, and the prospecting drifts have not as yet found anything of more value than the streaks of ore heretofore mentioned.

At the middle mines progress is slow at all points and the work being done is principally preparatory. The south drift on the 2400 level into the Potosi ground is making good headway in dry ground. It is not safe to attempt running crosscuts in any of the mines of this series until the high hydraulic pump is started at the Chollar-Norcross-Savage shaft.

BELMONT DISTRICT.

THE BARCELONA.—*Belmont Courier*, Nov. 16: Work in this mine is progressing satisfactorily. The ore is accumulating fast, and there is a large amount of first class ready to ship as soon as teams can be procured.

This Belmont mill will soon be put in order and started on ore now on the dump, aggregating nearly 3,000 tons, including about 400 tons first-class rock.

COLUMBUS DISTRICT.

NORTHERN BELLS.—*True Fissure*, Nov. 13: All work in the mine is being pushed ahead at fair speed, 82 tons of ore being extracted and sent to the mills daily. The various ore stops in the level above the adit continue to yield the usual quantity and quality of ore, and also promise finely for the future. The haulage shipments for the week ending November 12th amounted to \$21,522.61; for the month to same date, \$35,013.36.

MOUNT DIABLO.—No ore is now being taken out, but the work of prospecting is vigorously carried on.

MOUNT POTOSI.—An experienced miner who made an inspection of the mine a few days ago reports the prospects good. The mine is looking well.

WINDSOR.—The work of prospecting continues, with favorable results. The ledge recently struck is being developed. The managers of the property are satisfied with the prospects.

VICTOR.—Work has not yet been resumed in this mine, the business complications of the company not having been adjusted.

ESMERALDA DISTRICT.

PROSPECTUS.—*Esmeralda Herald*, Nov. 20: The Prospectus, under the superintendency of Wm. Irwin and the foremanship of Mr. Ford, is pushing work in both the Prospectus and Biadell tunnels. No new developments have as yet been made, though from the looks of the ore on the dump the prospect ahead is flattering.

GOLD MOUNTAIN DISTRICT.

NEW LIFE.—*Esmeralda Herald*, Nov. 20: The starting up of the State Line mine in Gold Mountain district will give it a new lease of life. The mine, of Li Valley, Silver Peak and Montezuma all within a radius of a few miles—new life, and as the mines of these districts possess merit, a stampede in that direction may at any time be looked for. All these districts are in Esmeralda county.

STATE LINE.—The State Line mine lies in Gold Mountain mining district, in Esmeralda county, and about 12 miles southwest of Lida Valley. It is on what is called the State Range, and is considered one of the finest series of mining property in the State. A depth of 200 ft has been attained, and the average width of the ledge is 20 ft, the whole of which will give \$45 per ton. The only drawback is the water, which has to be brought in pipes a distance of 12 miles. There is wood in abundance within 4 miles. A short time since the mine was sold to the present owners, Messrs. Taylor & Co., by Steve Roberts, Al Cortez and others. Isaac Taylor left Carson City Wednesday morning to take charge of the mine. We understand that machinery is to be put up at once, and the property worked in a business-like manner.

I X L DISTRICT.

NEW MILL.—*Silver State*, Nov. 15: Henry Lorenz, who is engaged in mining at I X L district, informs us that a 10-stamp mill is to be built at once on the Bayfield mine. The machinery is now on the way, and it is expected to be in running order before the 1st of February. The East Star Co. has entered into an agreement to have 100 tons of ore at the mill before next April. New locations are being developed, and this year the most profitable of the I X L people to get their supplies, as the road can be traveled summer and winter. He thinks I X L is destined to be quite a mining camp, and as soon as the mill is completed a great many people will settle in the district.

PIOCHE DISTRICT.

ONE.—*Pioche Record*, Nov. 16: The works at Bullionville employ about 60 men. As soon as the sampling machine is in readiness, Messrs. Godhe & Hampton will purchase all the ore that will be hauled to them, and will pile it on the dump to await the completion of the furnace.

ARIZONA.

MINERAL CREEK.—*Globe Chronicle*, Nov. 14: The Mineral Creek mining company has completed the main tunnel with the shaft. The company is going to commence the building of an ore dump at once, and prepare to open stops along the line of the tunnel, and finish the road to the mill, preparatory to shipping ore there for reduction. They are getting along well with the erection of the mill.

LEXINGTON.—This claim is about half a mile south-westerly from the Trojan, and shows well on the surface, while the shaft, 60 ft, and a drift on the vein of 15 ft at the bottom, has a well-defined vein of milling ore from 2 to 3 ft wide. The 80 ounces of this ore on the dump will average \$100 per ton.

EUREKA.—This is one of the earliest lodes discovered in the Gold Hill section, having been on the Eureka and Munsee locations, worked over 4 years ago, while in 5 of the principal locations upon it there is a good showing of high-grade ore. The ore streak and dump will return at the mill from \$30 to \$50 in gold per ton, and some silver. The Yarrow tunnel—This is the next claim northeast from the Amalia, and on it the lode has been thoroughly prospected near the surface by its Mexican owners. There are over 20 holes and cuts all along the ledge from 5 to 10 ft deep, and 4 to 8 ft wide, besides an open cut of over 40 ft long, with the ledge in sight from all of their openings. It has yielded good milling ore, which was worked in armstrong, and returned from \$50 to \$75 per ton.

THE YARROW TUNNEL.—This adjoins the Munsee, and shows the same ledge and ore on the surface. A tunnel has been run 137 ft to crosscut the ledge at 80 ft deep. They have still 40 ft to run before striking the ore body.

GOLDEN OATS.—Mr. Klein is now at work sinking a shaft on his claim, and with good results, as it has the ledge very solid and holding good ore at 15 ft deep. They found high-grade ore, which fills the shaft. From samples we have seen, which have free gold all through, this opening will yield as rich ore as that at any other point on the lode. A combination tunnel has also been run 200 ft between the claim and the Golden Star, and in a drift of 20 ft on the ledge they have a streak of rich ore from 2 to 3 ft wide.

THE GOLDEN STAR.—On this claim there is a drift of over 60 ft at the end of the tunnel, which has yielded over 200 tons of good milling ore. There is another tunnel of 65 ft, which cuts the lode and shows a large body of good milling ore. Altogether this lode, in all its various locations, shows as continuous and large a body of ore as any we have seen in the district.

The Townsend mill is working steadily, and although they cannot, with their present mill arrangements, recover all the gold and none of the silver in the ore, it is paying extremely well, more especially as 5 men on the mine are sufficient to get out enough ore (about 2 tons a day) to keep the mill going. From the show of ore in the mine, there would be no difficulty in keeping a first-class 10-stamp mill in constant operation.

The Golden Eagle mill is working regularly and smoothly, their being no hitch or contretemps. This is the result of getting practical mill men like Messrs. Palmer and Rice to erect such mills, so that the hullian output once regularly started can be depended upon by their owners.

The Moderator, adjoining the Empire, and in line with the California, near Ramboz camp, is turning out remarkably well. Mr. Burke purchased the property a short time ago from Doc. Wilson and W. A. Holmes, and in performing assessment work has discovered 16 inches of chloride of silver ore assaying \$190 per ton. The ore resembles that of the California.

CENTENNIAL MINE.—Reports from the Centennial are still of an encouraging character, the mine continuing to yield the same rich ore as heretofore reported. During the week Mr. Hillings has been making some very interesting experiments at the fashella mill that will be of interest to the entire district. Twenty tons of second-class Centennial ore have been worked by wet and dry process, and today roasting will be tried. Careful assays of the pulp and tailings are being made, and in a few days we shall know the best method of working such ores. Mr. Hillings is of the opinion that roasting will save a higher percentage. The average pulp assay of the 20 tons second-class ore worked was \$102 per ton. The first-class ore ranges from \$900 to \$3,000 per ton. During the week 70 tons of ore were shipped to the mill.

MOUNT DEVELOPMENT IN PATAGONIA.—*Arizona Citizen*, Nov. 13: J. D. Andrews left Monday with a team loaded with tools and supplies for Patagonia, to take charge of and put a force of men at work on a group of 6 claims owned by a strong Pennsylvania company, of which Mr. J. N. Freck is manager. Mr. Andrews is instructed to commence work at once on all 6 claims; and on the Good Hope mine, which has already been developed sufficiently to gravitate a valuable body of ore, he is to sink a working shaft 150 ft. Mr. Andrews has contracted to develop other properties in that vicinity, as he has mines of his own to look after. During the past 6 months, Mr. Andrews has been in charge of the San Xavier mining and smelting company's mines, and leaves the same in good order to fulfill contracts made with manager Freck last spring.

A GOOD PROSPECT.—The Black Jack mine, on the western slope of the Mule mountains, has a shaft down 22 ft, and is progressing at the rate of 1 ft a day. The last assay shows \$84.25 silver and 35¢ copper, equal to a total of \$24.25. The walls are well defined, being true and well cased. The owners propose to continue the work, and feel confident of being able to show up one of the best mines in southern Arizona.

SAN XAVIER MINE.—Now that the San Xavier mining and smelting company's mine is turning out a booming success, it is hardly surprising that the claims owned by them have been recently located showing now heard from. The Little May takes the lead among the latter as a haulion producer. With but little work of 2 men they have several tons of high-grade ore sacked, and in a short time will make a shipment of a carload to San Francisco as a test. It is expected that the shipment will average from \$400 to \$500 per ton.

One has been discovered of a good quality in several places on Mule mountains, which has caused quite a stampede to secure good ground. Messrs. Jackson, Gleason and Flattery have made quite a number of locations, among them the Mayflower and Contentment, all of which are good locations with rich ore. Messrs. Andrews and Smith have also made several locations, some of which show well, particularly the Oro Fino mine, Standard copper mine and the Terror. The latter is a very rich ore on Santa Cruz locations, near by, show some very rich ore on the surface, on which work will not be commenced till after New Year. There are quite a number of copper claims in the immediate vicinity. The Catalina and Solid Muldoon show large bodies of carbonate ores that can be very cheaply reduced to bullion; also the Papago Chief mine has large bodies of carbonate ore, and the latter is in a large way all the way down. The Esperanza mine will soon have steam hoisting works, which are very much needed, as they cannot go any deeper on account of water. Quite a number of locations in and around the Sierritas are now being worked on, and it is work on mines that is bringing Pima county to the front.

COLORADO.

ATLANTIC DISTRICT.—*Colorado Miner*, Nov. 14: The Snowy Range is one of the most important discoveries of the past season. It is opened by a shaft 50 ft deep, which shows a large vein carrying copper pyrites and silver glance. There have been some 100 tons of ore taken from this property, the highest mill being 250 ft. The highest mill of silver per ton, and the lowest 105. The Little Emma, Pleasant Hill and Homestake are new claims with old names, which are highly spoken of by others than their owners. They all lie near the Snowy Range, the Pleasant Hill being an extension of that lode. These claims, with many others, have been located and recorded ready for starting up in the spring. There is no question that the mines of this district will make their market next season. They are usually large, decided fissures, easily traceable for long distances on the surface, and are in the hands of men who will prosecute their development.

DAILY DISTRICT.—What has been said of Atlantic district may be said of Camp Robinson, the head of Ruby gulch, Daily district. The Silver King, Ketchikan, Shock, Ruth, Overhartz and other adies, are all promising locations of last summer. A year was not time to make due preparation for working them during the winter season, they will remain dormant until spring.

RABBIT EAR RANCH.—Mr. C. H. Hook has just returned from over in the Park, and says that in no time in his

tory has the mining outlook been so bright. The Grand Lake, Alvin Hubert, Hendershot and Morgan lodes are looking exceedingly well.

MIDDLE PARK NEWS.—Capt. Hornbrook came over from Middle Park last Saturday. He reports about 4 ft of snow in the Rabbit Ear Range, which has stopped all out-door work on the mines. A crosscut tunnel 43 ft in length has cut the Hidden Treasures lode 23 ft in depth, and is connected by a shaft to the surface. A drift has been extended 24 ft, and the workings on the vein show from 20 to 24 inches of mineral, carrying more or less gray copper. The Wolverine mine is showing larger quantities and better ore than ever. The company working 23 shifts and will soon work 3, and will continue development all winter with 9 men.

IDAHO.

BAT HORSE NOTES.—*Yankee Fork Herald*, Nov. 13: Dan Sullivan, who came over from Challis Thursday, informs us that the smelter at Bat Horse, after a run of nearly 3 months, was to have shut down yesterday. During the time it was running from 80 to 100 bars of bullion were shipped daily. They weighed 100 lbs each, and were worth 800 ounces per ton. Dave Woods and Sam Staples commenced work on the Excelsior last week. It is one of the best mines in the district. Work will be continued all winter on the Beardsley, Silver Wing and Hood mines. The men have been disappointed in the claims Horn, as no more work will be done on it for a while. The enormous shipments made from the camp this year were above the most sanguine expectations, and another stack will be added to the smelter as soon as spring opens. Bat Horse is undoubtedly one of the richest districts in the Territory.

CUSTER MILL AND MINE.—Work is progressing finely on the Custer mill. The interior work, the shaft and the brick work for the roasters is progressing rapidly. The machinery is being put in place and it is expected crushing will commence about the 15th of December. The ore house, at the back of the mill, is a 2-story and will hold an immense quantity of rock. A fine and commodious assay office has been completed. The ore now being taken from the mine is better than any ever before encountered, and the mill could easily be kept running at a rate of \$500 per ton for several months should the company so desire.

SAW TOOTH.—A good mining and business boom is expected in the Saw Tooth and Wood River camps next spring. As early in the season as possible the wagon road will be extended from Galena over the Wood River divide to Salmon valley, distant 4 or 5 miles. This will be a great convenience to the upper Salmon mining camps. The probability now is that 2, if not 3 mills, will go up in the Saw Tooth, where the ore is all free milling, and at least 4 smelters it is believed will be erected at Galena in the spring or summer. Many of the best properties in the neighborhood of Galena have passed into the hands of capitalists. The mines are developing beyond the expectations of the most sanguine. The ore, all though rich at the surface, show still greater wealth in depth is obtained, some veins carrying streaks of ore that assay from 1,000 to 10,000 ounces silver per ton. The ledges are generally from 3 to 4 ft in width, well defined and in formations that indicate permanency. In Smiley's canyon two companies are at work—the Emma and Vienna. The Emma is owned by Messrs. Levi Smiley, the discoverer, and Geo. R. Ayer. A 76-ft shaft on the Vienna shows a 4-ft vein of good ore, most of it assaying from \$300 to \$1,200 per ton. The Vienna, from which ore has been shipped to Salt Lake the past season, is the best developed mine in Smiley canyon. At a depth of 250 ft from the apex or point on the ridge at which the discovery was made, the vein is 4 ft in width, the best ore sampling over \$3,000 per ton, and the medium from \$100 to \$500 per ton. A tunnel is now being run to open the ledge at still greater depths.

BEAVER.—The celebrated mine of Beaver canyon are located about 4 miles up the gulch from Saw Tooth city. Much work has been done on the mines this season—enough to prove their wealth and permanency. Among these are the Columba and Beaver, owned and operated by New York parties. Tunnel contracts have been let on these mines, and they will be further developed this coming winter. The Columba mine shows a vein about 400 ft long. The Beaver is this fall, and has large quantities of 150 ore on the dumps. The Beaver shows a strong vein of black sulphurets. Col. Broadhead has the management of the mines. The noted Pilgrim mine has a shaft 90 ft deep, all the distance in very rich ore. The vein is, at the widest, 22 ft in width, 6 to 8 ft of which is rich in ruby and native silver. A tunnel will be run this winter to open the vein at a depth of 300 to 400 ft. There are other rich mines in the immediate vicinity of the Pilgrim that contain high grade ores. In Lake canyon are the Cambria, Wire Silver and Comstock; and a little further on are the Scotia and Lucky Boy—both very rich and developing splendidly. The latter mine was recently purchased by a New York company for \$50,000. Some of the ore assays well up into the thousands. The Lucky Boy company expect to put up a mill next season. North of the Lucky Boy are the Atlanta, Idaho, Summit and others, all of which carry more or less rich ore. The prospects at present indicate that before another season is over the Saw Tooth camps will be noted far and near for the richness and abundance of their ores, and there is yet much unexplored country for the prospector to operate in.

MONTANA.

MADISON COUNTY.—*New Northwest*, Nov. 12: Messrs. Hall & Rosier cleaned up the fume at Summit for the season, last week. They have taken out 1,500 ounces of gold dust for their summer's work. Old Alder continues to pungle handsomely for ye horny-fisted miner. Last Saturday Edward Herendeen deposited with carrier Elting I, Highland fume company, in Alder gulch. The expenses of working were less than 17% of the yield.

PACIFIC.—*Butte Miner*, Nov. 16: The main shaft is 50 ft deep. From the bottom the drifts have been extended west 50 ft and east 115 ft, according to yesterday's measurement. In the east drift 4 men are employed, and in the west 3. The drift is a mill next season. The idea of extracting daily 20 tons of ore, from which about 500 lbs of gold ore of the size of the ore body. Several hundred pounds of ore are in the dump which will average from \$30 to \$35 per ton. It is perfectly free and can therefore be easily milled.

NEW MEXICO.

SALE OF CLIFTON PLACERS.—*Herald and Southwest*, Nov. 13: We take great pleasure in announcing the fact that all the placer mines in and about Oro, in the Greenlee Gold Mountain mining district, have been consolidated and sold to Boston men. Some time last spring our townsmen, W. H. Newcomb, negotiated the sale of certain individual claims on the Fresno River, and personally supervised prospecting in and about this district. Becoming more interested, the further he pushed his examinations, he furnished a large amount of money and thoroughly prospected the banks of the river for some 10 or 12 miles from Clifton. During June, July and August a force of men was put to work, and several thousand tons of gravel were put through the sluices. A clean up of certain and was put through simple surface workings were satisfactory, giving great encouragement, and warranting erecting hydraulic works second to none in California. In August Dr. J. P. Welch, the well-known manager of the Canyon del Agua property, visited Silver City, and became interested in these placers. He visited Clifton and Oro, and certain claims below those owned by Newcomb and others, and desired to prospect farther up the river. Returning shortly after to Silver City, a consultation with Newcomb and others, resulting in a proposition from Dr. Welch, who, representing capitalists both here and in Washington, was in a shape to take the whole mass of claims lying both sides of the river for some 5 miles, also claims others lying back from the water course. These properties have been bought and will be consolidated into one company. The consideration paid is upwards of \$1,000,000, and showed observers claim the properties are well worth the purchase money. The water is on the property, giving investors natural advantages which have been so dearly paid for in other localities.

Tallow Butter and Lard Cheese.

Our simple-minded dairymen who are still using pure milk for their butter and cheese-making, have but little idea of the elaborate mixtures which are creeping into the Eastern manufacture of dairy products. They have, of course, read of the millions of lbs. of tallow butter which are consumed in New York, and shipped thence to Europe, but the subject doubtless impressed them only as a distant abomination which gave no menace to local industry. Such indeed it is, but there are reachings out westward, which give the matter no little pertinence here. We were not a little startled to receive in the mail this week a postal card, postmarked at one of the large cities of western New York, which reads as follows:

SIR:—If you will save your slaughter and kidney bullocks fat clean and sweet, and pack same day as you ship it, and drop card, I will pay five cents per lb. for it and pay freight. Salt barrels will answer; and as it is for tallow butter making, must be free from sweetbread. It should be bung up to cool quick in the air before being put into barrels, and not cool off in the barrel. This is a new outlet for fat at an advance rate while the usual outlet is declining.—Yours, etc.,

This message was doubtless intended for some butcher in a neighboring town, but our address was by some mishap placed upon it. The significance of the message is, that the large manufactories of tallow butter adjacent to the slaughter houses of New York and Brooklyn have found that the metropolitan supply of tallow is not enough to meet their needs, and so they are reaching out after the refuse from the country butchers. This is only what might have been expected, when the enormous mass of tallow butter produced is in mind, but it is nevertheless startling to be brought face to face with the fact. The thought that the fat from the thousands of country slaughter houses, most of them reeking in filth and filled with an atmosphere of intolerable stench, should be cast into old barrels and shipped by rail to the dens of the tallow butter-makers, and there mangled and tortured into a wretched counterfeit, to be offered to consumers as a substitute for the fragrant product of the farm, is not a pleasant one to a person who takes pride in the history and progress of our grand dairy industry. And yet just such is the course of affairs. Not only to western New York has the greed for cheap fat extended. It has erected its temples in the great cities of the west, and has penetrated beyond, even to the heart of the dairy region of Wisconsin, where we read there is a counterfeit butter made by mingling a certain proportion of tallow with butter instead of producing the counterfeit from soft tallow churned with sour milk, which is the method of the "pure counterfeit." It is natural that the butter-makers of the east are up in arms against all these devices, and our exchanges are holding up for reprobation the names of the firms engaged in the manufacture and traffic.

Another style of mixture which seems to be gaining some ground in eastern dairy produce, and which strikes us as much less objectionable than the counterfeit butter, is the introduction of a small percentage of lard into the skim milk for the manufacture of an improved skim milk cheese. This is now being done in St. Lawrence county, New York, where there are large butter factories, and, consequently, a large amount of skim milk to be turned to some account. Skim milk cheese is, as a rule, poor stuff—hard, indigestible, and a drug in the market. It is found that by adding $\frac{1}{4}$ lbs. of pure lard to 50 lbs. of skim milk there is produced a cheese which is rich enough in fat, and becomes palatable and digestible. This introduction of fat is analogous to the use of lard as "shortening" in kitchen practice, and if done in a cleanly manner can hardly be more objectionable. As there is a strictly fine article of creamery butter, made from the cream which is removed, and as the skim milk is handled in the dairy factory, it strikes us as a legitimate saving of the skim milk, which, without the addition of the shortening, could only be used as food for calves and hogs. The pecuniary aspect of this method of cheese-making is given as follows:

One hundred pounds of new fresh milk yields 4 lbs. of butter and 80 lbs. of pure sweet skim milk; to that skim milk add $\frac{1}{4}$ lbs. of lard, and it produces 8 lbs. cheese, which, at 8 cents amounts to 64 cents; without adding lard, it produces 6 lbs. cheese at 6 cents, 36 cents; add cost of lard, say 14 cents; total 50 cents; difference in skim milk by new process, 11 cents; thereby making the value of 80 lbs. of skim milk worth 11 cents more by using the new process than it would be using the old methods, besides producing a quality of cheese that will be readily bought.

There are in St. Lawrence county at least 90,000 cows. A cow during the factory season should produce 3,000 lbs. of milk. Deduct one-fifth for skimming, leaving 2,400 lbs. skim milk, increased by using this process 11 cents per 100 lbs., would make \$2.60 per cow on the product of factory season of six months, and you have a grand increase in the county of \$225,000. The milk from 40,000 cows in the county is now manufactured in cheese factories. Increased by this process \$2.50 per cow, you have a grand total of \$100,000, and every dollar of that goes into the pockets of the dairymen.

Thus we have the latest phases of two of the newer practices in connection with dairying. The first seems to us thoroughly objectionable, as it results in a counterfeit, employs the basest materials and builds up, in opposition to legitimate dairying, a business which steals the form of the genuine to serve the false; the latter enables the dairymen to gain the profit of fine butter making and then adds him to turn his skim milk into a palatable and digestible cheese.

The Mold of Bread.

With a view of interesting our readers who may have microscopes, but have not done much in the study of microscopic fungi, we shall give a chapter or two concerning the structure of some cryptogamic plants which one meets with most often. Among these are the molds which form upon foods, upon the walls of damp buildings and upon many other objects. One of the most common of these is the mold of bread which we choose for illustration and description upon this page.

The name of this mold is *penicillium crustaceum* and it belongs to the order of fungi called *Hyphomycetes*. The predominant feature in the structure of this order, according to Cooke, consists in the development of the vegetative system under the form of simple or branched threads on which the fruit is generated. One of the large genera under this order is one which includes the black molds which are seen on decaying wood and the like, and another is the *Mucedines* or molds on food, etc., to which we would especially refer.

In the engraving, *a*, is the bread mold as it appears to the naked eye when full grown. It is trite to say that such a patch of fungus would look like a forest if examined with a microscope,

when a proper foster substance is exposed. These fungus spores have been gathered from the atmosphere and identified by the microscope.

Molds may be guarded against by fresing the apartment from moisture. Thus, opening the windows and admitting the sunlight, will arrest the formation of mold upon the walls of a damp apartment. A similar result can be attained in cloudy weather by building a hot fire in the room and drying the air thoroughly. In cellars and the like, the fungus can be arrested by a free use of powdered sulphur, or by occasional whitewashing. Such precautions should always be taken, for an atmosphere which favors the formation of mold is not favorable to health and bodily comfort.

THE PROFITS OF MINING.—Legitimate mining in the United States offers better inducements to persons seeking investments than any other industry, not excepting agricultural or commercial. Carefully compiled statistics show that for every dollar expended in searching for gold, between four and five dollars are realized. A great proportion of the failures that occur in connection with this pursuit are due to gross mismanagement. Men who would not for a moment entertain a thought of embarking in a mercantile venture without having an extended experience in the particular line of business,

GROWTH OF BREAD MOLD AS SEEN WITH THE MICROSCOPE.

and how far this is true may be learned from Fig. *b*, which shows the mold as seen with a moderate magnifying power. It is plain from this that the mold is really composed of minute plants. The manner of its growth is by the ramification of minute filaments (called the mycelium of the plant), and from these, here and there, there arise thread-like stems which branch at the top and throw out rows of spores like strings of beads. As these spores ripen they are represented as dropping from the plumed top of the stem. This figure is magnified 420 diameters, a power which can only be satisfactorily attained with a compound microscope. The same fruit-bearing stage of the fungus is seen still more enlarged at *d*, merely the apex of the fruit stem being shown and magnified 620 diameters. A single chain of spores is still more enlarged at *e*, and the spores are seen to be perfectly formed spherical bodies or cells, but slightly attached to each other. As they ripen this slight attachment gives way and the spores are free. They go hither and thither and when they fall upon a favoring substance they send forth sprouts as seen at *f*, and thus new patches of mold are quickly formed and spread so fast that the substance is quickly enveloped in the coating.

It is often asked, whence comes the mold which quickly attacks food left exposed in a damp atmosphere. It has been demonstrated that the minute spores are carried everywhere in the air. They are so minute and so light that their transportation is easily effected. As the seed (as it were) of the fungus is thus ever present it needs but the proper conditions of

and also having about them a corps of equally well posted assistants, will rush blindly into mining and place complete reliance in luck. Such men regard their efforts as a mere gamble, and are successful about as often as the faro player. The other class of mine owners who in developing their properties put every dollar where it will do the most good, require their employees to do a good day's work for a good day's wages, save a dollar here and a dollar there wherever they see an opportunity above or below ground, are practical miners of wide experience or else have under them in every department trustworthy men, while they themselves are shrewd financiers—these men are almost always successful. A failure with them is the exception, while with less shrewd investors it is the rule.—*Nevada Transcript*.

AMERICAN MECHANICAL ENGINEERS.—The first annual meeting of the American Society of Mechanical Engineers commenced its session November 4th, at the rooms of the American Society of Civil Engineers, 104 East Twentieth street, New York. This society was organized in April last "to promote the arts and sciences connected with engineering and mechanical construction." Prof. Thurston, the Secretary, has issued a circular to the members, urging their full participation.

The last experiment to find a substitute for water in steam boilers seems more promising than any heretofore made, and consists of hisulphide of carbon used in connection with petroleum in proportion of three of the sulphide

The European Phylloxera Congress.

As many of our readers are aware there is an organization in Europe composed of leading entomologists and others, entitled the "Phylloxera Congress." This body has had meetings at different points in the infested districts, and has promulgated several manifestoes against the pest. The last meeting was held in Saragossa, Spain, and a report thereof has been furnished to the *New York Herald*. It does not appear that any sovereign cure for the evil has yet been brought to light, excepting such indirect escapes from destruction which have been suggested. However, there were several points of interest brought forward, which are contained in the following paragraphs: On the third day of this congress, M. Planchon, the French savant and traveler of repute, opened a vigorous campaign in favor of the American vines that he had studied and examined in the States. He laid down as an axiom that no American vines are proof against the phylloxera, but that they have such powers of resistance to its effects that they can be and ought to be seriously recommended to wine growers all over the world. According to Planchon these powers of resistance, greater in some classes of American vines than others, arise from their anatomical and physiological conditions. Directly after M. Planchon, the learned professor of the School of Agriculture in Montpellier, took up the same subject and demonstrated that from his own practical experiments at Montpellier, and from experiments on a large scale in the southern departments of France, it was a proven fact in the eyes of scientific men and in the annual vintage of wine growers, that American plants produce as many barrels of wine per acre as the French vines, and if grafted with the *vitis vinifera* they produce capital results. The last assertion of Prof. Saint-Pierre was ably supported by the great savant, M. Foex, who reviewed all the varied species of American vines that have been successfully introduced in Europe, and refuted the theory of some authors who pretend that American vines, owing to their robust and rather spreading exuberance of roots, require a rich soil and deep hed of resisting strata. Prof. Foex proved by examples from the vineyards of Languedoc and Aquitaine, from instances in the valleys of the Rhone and Garonne, where the soils are so varied and different in point of resistance and depth, that the species *Solonis*, *Violla Riparia*, *Agresta* and *Taylor* have all been used for grafting purposes with the old French plants, or for new plantations, and success in point of production, as well as in powers of resistance to phylloxera invasions, has been clearly attested even by unscientific observers. Next to the French Professor the American vines found a very decided champion in Baron de Prato, the Austrian delegate, who declared that in his travels in France, Germany and Italy he had more than once noticed the contrast between American plants, still vigorous, covered with green foliage and fruit, though they were attacked with phylloxera in their roots or trunk, and a few yards off the native plants, French or Italian, were shriveled, leafless and utterly useless for producing wine or fruit.

The question of remedies and palliatives was discussed at length in the congress, and most of the French and foreign savants seemed to patronize the liberal application of bisulphide of carbon to destroy the insect, and of sulpho-carbonate of potash, which tends to strengthen the plant itself. Senora Miret and Munoz Castillo gave interesting data on the researches made at the expense of the government and of the provincial councils to find some insecticide substance, and the almost general failure of these panaceas until water, fire, and finally the pulling up of the infected plants were resorted to, as the same means had been attempted in France and Italy. In one French department—Le Gard—out of 94,000 hectares of 376,000 acres of vineyards, more than five-sevenths were uprooted. After long debates, in which natives and foreigners came to the conclusion that the best preventive precautions were in vigilant examination of the vines, in good manures and careful tilling of the soil, in severe measures against the infested districts or countries and their exports, the congress closed, after adopting the following resolutions:

First—To defend the vineyards at any cost whenever it may be possible to do so, and to prevent the invasion and propagation of the insect at any cost.

Second—The extinction of all focuses of phylloxera by insecticide substances and other modes of relief that must be employed in the cases that science and experience may recommend.

Third—When the varied means of extinction are inefficient, wine growers must have recourse to the American vine.

Fourth—In future plantations of resisting American plants must be organized in every province and wine-growing center, and the plants so introduced must be distributed among the cultivators of the vine to allow them to study their conditions of adaptations.

Fifth—In the districts that are completely infested, the authorities ought to allow the immediate and direct introduction of American shoots for grafting purposes, but without trunk or roots, and such shoots, if they are of the year's growth, must be brought into the country with all the precautions that the administration and science may deem necessary, and subject to all the prescriptions that laws and regulations may determine.

Sixth—The congress must respectfully inform the government that it deems a reform of the actual legislation on the phylloxera necessary and most urgent.

These resolutions have struck every one as proving that the congress had not achieved much in its 11 sittings beyond recommending the introduction of the American vines, now

Persevering Gravel Miners.

A *Phmas National* reporter recently made a trip to the Elizabethtown country to look at the famous mine owned by Messrs. Loring & Leavitt. The story of the mine, as told by the reporter, shows what energy and pluck and perseverance will do. The *National* says: The mines at Elizabethtown were discovered in 1852, and for several years it was a very lively and flourishing mining camp. The bench claims on both sides of the town were notable for their rich deposits, while Emigrant hill, just above town, turned out thousands of dollars. Betsy gulch, also very rich, empties into the flat almost directly at the point now being worked. The channels were broken up, running for several hundred ft. in some places, and then ending abruptly. In places the pay was enormous, and cravies which produced hundreds of dollars in a ft. or two were nothing unusual. In many places these channels broke down into the flat on which stood the town, and many old miners had an idea that the bottom of this flat was good, but as it was supposed to be deep, with considerable water to interfere with the working, it was left for the present owners to develop. One shaft was sunk by Judkins & Co. in 1853, but they got into trouble about the time that bedrock was reached; the work was abandoned and the shaft gradually filled up. The old claims passed from one owner to another until purchased by Messrs. Loring & Leavitt. They worked in several places, with varying success, until some five years ago, when they concluded to test this flat, and to that end commenced a drain tunnel, which they have been pushing steadily ever since. Pay ground was found several times, but usually it "jumped off" too deep for their tunnel, and they were obliged to leave it behind. They persevered, however, and pushed the tunnel under difficulties which would have appalled almost anyone but them. Thirty-two hundred ft. of this tunnel were cut, and all solidly timbered, in many places the "lagging" having to be put on top, sides and bottom, and the cracks battened to keep out the quicksand, which would fill the tunnel in an hour through a crack a quarter of an inch wide. They got into bedrock last winter, and this spring, or rather this summer, they struck pay. Considerable work has been done since then, and the "pay-streak" pretty well developed. They have demonstrated that it is 70 ft. in width, and it may be much more, as the cross tunnel has not found this end of it. The main tunnel has progressed up the flat, directly towards Emigrant hill, over 100 ft. all in rich pay. The ground averages about \$20 to the man per day, and will do much more than that when they get into good shape for "blocking out." Of course the pay is not regular, as the rich deposits are found in favorable crevices, but all of the gravel taken out has more or less gold in it, and it is rich for from one to three ft. above the bedrock. The gold is the regular old-fashioned Elizabethtown lead gold, pieces ranging from a cent to \$50. Nearly \$400 came out of two sets of timbers—about eight ft. of tunnel—a week or so ago, and the service was crossed and left until the breasting commenced. Probably that crevice will yield several thousand dollars. The work is done through shafts about 60 ft. in depth, and the dirt is raised by the power of an overshot wheel. Several hundred ft. of pay dirt is certain between the works and the canyon which comes down from Emigrant hill, and as it is very wide they are sure of many thousand dollars before it is cleaned up. It is also certain that they have run over and left behind a large section of pay-ground which will be opened up after a while. On the whole we can see no possible chance for a failure, and with good management the present owners can safely count on quitting the mine in independent circumstances.

We congratulate Messrs. Loring & Leavitt on their success. They deserve it if anybody does, for they have labored long and faithfully. With the main tunnel and the numerous cross-cuts, prospecting drifts, shafts, etc., it is probable that they have run 5,000 ft. of tunnel before they found pay worth speaking about, and Mr. Leavitt informed us that for three years before the "pay-streak" was discovered, he did not make a "four-bit piece." They had no capital but their muscles, and with that alone they have overcome the obstacles in their path and gained a splendid success.

There are many more just such places in this immediate vicinity, and with the capital coming here for investment, and the interest now being taken in prospecting, it is certain that they will be developed.

THE railroads of this country continue to prosper, their earnings being considerably ahead of those received during a corresponding period for the last few years. The fact that this improvement is not confined to some leading lines of travel, nor to those of a few favored sections, but extends to all with hardly an exception, and is true for those of the East as well as those of the West speaks eloquently for the sound condition of internal commerce.

WORKING THE WASTE DUMPS.—Mr. Leahy, who visited that section day before yesterday, says that about 20 men, Chinese and white, are engaged in working over the waste dumps at this old Allison ranch mine. Some of the pills have previously been worked two or three times, but nevertheless the persons now engaged on them claim to make good wages.—*Nevada Transcript*.

USEFUL INFORMATION.

A New Departure in Color Printing.

A many-colored printing machine has been constructed in Boston for the Forbes Lithograph Manufacturing Company which will be signally efficient in color printing. It is entirely free from the objectionable features of the bed and platen presses, upon which as all practical printers know, it is almost impossible to print good, stiff, body colors from a large surface and remove the sheet quickly from the thins—it being possible only to do it by using thick ink and heavy paper.

By the new press solid colors of many feet square can be printed, even on thin paper, just as easily as the smallest cut. The old operation made it necessary to pass the sheet through the press as often as there were colors to be printed; to wait until each was dry, and to clean the press after each printing, or to use as many presses as there were colors employed, occasioning much delay, or involving the expense of numerous presses with the required pressmen and attendants—all of which has increased the cost to the customer. The new press will print by a continuous operation as many colors as it is designed for, and its scope is not limited in any direction. This important invention will be of immense advantage to the Forbes company in their ability to produce better work; in the saving of the ordinary waste by false registering, and in the rapidity with which they can execute orders where various colors are used.

The Forbes Lithograph Manufacturing Company are also building a bed and platen press which in novelty of construction, rapidity of action and quality of work will surpass any of its kind heretofore made. It will be fed from a continuous roll, and print a number of colors at once.—*Boston Commercial Bulletin*.

A LIGHTNING FLASH.—All the more ordinary effects of "lightning" may easily be reproduced by artificial means, but on a very small scale—how small may be readily inferred from the fact that a three-ft. spark is considered a long one, even from the most powerful machines, while it is quite certain that lightning flashes in the clouds, or from one cloud to another, often exceed a mile in length, and sometimes extend to four, and even five miles. The destructive power of a spark from a machine or from a lightning flash in the clouds is proportioned to the distance over which the spark or flash will move. When a tree is struck by a violent discharge, a large portion of the trunk is usually split into fragments. A more moderate discharge simply ruptures the channels through which the sap flows, and a tree is often thus killed without any visible or external evidences of damage. This result is due to the sudden vaporization of the sap. In this first case the heat is so great and in such volume that the vaporization takes place with the suddenness due to the burning of an explosive compound, and may be illustrated by the violent action produced by pouring melted iron upon so small a quantity as only a few drops of water.—*California*.

PLAN FOR CATCHING THE EXPRESS TRAINS.—M. Hanrez, of Paris, is the author of a method of taking up carriages by a train en route, in order to avoid stopping trains at stations to take passengers up. A "waiting carriage," fitted with a steam engine with a special gear and space for passengers and luggage, is placed on a siding at the station, and picked up by the train as it goes past. The latter, by means of a hook on its last carriage, catches a ring supported on a post, and connected with a cable wound on a drum in the waiting carriage. Thereupon the drum begins to unwind, and in doing so compresses a system of springs, while the carriage is moved at a rate gradually increasing to that of the train. The engines of the carriage then winds in the cable, the train and carriage are connected, passengers are transferred from the joined carriage to the train, and vice versa, then the two are disconnected, [and the engine of the carriage working on the wheels brings it back to the station whence it was taken.

ANNEALING.—It is well known that glass acquires remarkable toughness by being annealed in oil, and that a high degree of hardness is conferred upon metals by a similar process. It is said that engravers and watchmakers of Germany harden their tools in sealing wax. The tool is heated to whiteness and plunged into wax, withdrawn after an instant and plunged in again, the process being repeated until the steel is too cold to enter the wax. The steel is said to become, after this process, almost as hard as the diamond, and, when touched with a little oil or turpentine, the tools are excellent for engraving and also for piercing the hardest metal.

HANGING GARDENS.—To make a hanging garden, take a white sponge of large size and sow it full of rice, hemp, canary, grass, and other seeds. Then place it in a shallow dish, in which a little water is constantly kept, and as the sponge will absorb the moisture, the seeds will begin to sprout before many days. When this has fairly taken place, by means of cords the sponge may be suspended in the window where a little sun will enter. It will thus become a mass of green foliage, and should be refreshed with water daily so as to be kept moist.

SUBSTITUTE FOR RUBBER.—A substitute for rubber, which, while it is cheaper, is elastic and tough, and not injured by high pressure or temperature, is prepared as follows: A quantity of coal-tar oil, or equal parts of coal and wood-tar oil, which is to constitute a third part of the whole mixture, is poured into a large kettle, together with an equal quantity of hump oil, and is heated for several hours, either over steam or an open fire, to a temperature which lies between 252° and 288° F. (it should not exceed the latter), until the mass becomes so ductile that it can be drawn in long threads, and the remaining third, consisting of a quantity of linseed oil which has been thickened by boiling, is then added. With this composition from 5% to 10% of ozokerite and some spermaceti should be mixed. The mass is then heated again for some hours at the same temperature as above, and finally from 7% to 12% of sulphur are added. The mixture thus obtained is cast into forms and treated the same as caoutchouc.

CINCHONA CONSUMPTION.—Those who are alarmed lest the supply of cinchona should run short, will do well to consider the following: Mr. Ferguson, in his "Ceylon Directory," estimates the total consumption of cinchona bark for the world at 12,624,000 lbs. A writer in the *Colombo Observer* says: "I do not think I am over-estimating the number of cinchonas that will be planted in 1880 throughout this island at 20,000,000; allow 5,000,000 for failures and add 5,000,000 for plants planted in previous years and now alive, and it will give you 20,000,000 cinchona trees, which in five years will yield, either by taking strips and mowing, or by the shaving process, about 10,000,000 lbs. of dry bark a year." Mr. Ferguson estimates the production of cinchona bark for the world at 13,471,000 lbs., of which Ceylon is put down for 150,000 lbs.; "hnt when," remarks the correspondent referred to, "it produces 10,000,000, as I believe it will in 1885, the total production of this world will exceed the demand of 1876-78 by 10,847,000 lbs. The question therefore arises, will the demand for the cinchona bark in 1885 equal the supply, or will the bark become unsalable except at unremunerative prices?"

TO PRESERVE WOOD.—Wood that is exposed to the action of water or left into the ground, should first be charred, and then, before it is entirely cooled, be treated with tar until the wood is thoroughly impregnated. The acetic acid and oils contained in the tar are evaporated by the heat, and only the resin left behind, which penetrates the pores of the wood and forms an air-tight and water-proof envelope. Should the posts only be charred without the subsequent treatment with tar, the charcoal formation on the surface would only act as an absorber of the moisture, and, if anything, only hasten the decay.

GOOD HEALTH.

The Bath-room.

[Written for the Press by Mrs. C. F. YOUNG.]

Sisters of the Press family who live in small houses: If the children are uneasy and fretful, if you sometimes are particularly nervous and easily disturbed, just try the soothing effects of a full hot bath early in the morning. An aged person, or an invalid, or infant will relish it best just before going to bed at night as a sedative, snubbing them to sleep better. Followed by a cold dash over the head and a band-width pouring along the length of the spine, it is one of the best known tonics, and should always be taken before breakfast in a warm room. But in California houses the made bath-room is seldom provided. How in a rented house we managed the arrangement of a cosy, comfortable bath-room and kitchen, we wish to tell, and ask you each and all to do likewise.

Our kitchen is a lean-to shed-room (16x12 ft.), 6 inches lower than the porch. Against the house we put two wide shelves—16 inches—one two inches higher than the table; the other five ft. higher, and across the whole width of the 16-ft. room. The top shelf we use for honey frames, boxes, choice bits of lumber, etc., that must be sheltered from sun and rain. Three ft. six inches of the lower shelf has four others above it for dishes. The next two and a half ft. has the flour box (a clean boot-box with corners tinned). The cover is the molding board. The next space (three and a half ft.) has two short shelves above it, making room for cleansed coal-oil cans, with plank covers—one can each for oatmeal, cracked wheat, cornmeal, split peas, beans, rice, tapioca, white and brown sugar. In front of these, about midway the room, is the table. The next eight ft. in width, by five ft. in depth, is piled clear up to the roof with fine split oak stove-wood, as also under the table. All these articles are within two, three and four steps of the stove, which stands at the right of the east door going in, occupying (a No. 7) three ft. of space, the door also three ft., the shelf one ft. and a half, leaving six ft. and a half beyond the stove clear space, by nine in depth for a bath-room. Into this, with our own hands, we set two pans of glass to admit light. We cut a hole at the bottom of the ceiling four by six inches, nailed

three pieces of siding-boards into an open box; one end touched the spring drain on the outside; the other, with this end closed, extended into an empty orange box laid flat side down. Over this we placed a tub, made by sawing off eight inches of the length of a 40-gallon cask; in the bottom, with a two-inch auger, bored a hole; into that fitted a six-inch pine plug; through it bored a three-quarter inch hole; into that fitted a common cork; whittled off the sharp edges of the top of the tub; six and a half ft. from the tub placed a large box cut in half; in it placed, near the top, a shelf; at the end a narrow board, up to the roof; on it a small looking glass, a pin cushion and two books. The cupboard shelf is for towels, sponges and clean garments. The lower part holds a box, a stool and clothes bag; movable rugs are on the floor. The sides of this room are well papered with common newspapers. The children added some pressed leaves, so as to have something pretty to look at while taking a sweat to break up a cold, or to scald and thus kill the poison oak. A thick curtain passes from the stove side to the box, perfectly protecting the bathers and their attendant; a chair and stool and smaller tub for cold water. Hot water, at the pleasure of the bather, can be dipped from the boiler which stands on the hearth, or from a big pan in the oven. By pulling the cork the waste passes off without lifting. Rinse the tub and it is speedily ready for the next one. We do not believe in or like long bath tubs, because of the temptation to lie on one's back in warm or hot water.

The ganglionic nervous system is found along the length of the spine. Heat relaxes the organs to which the ganglia radiates its fibrilla—hence debility and colds experienced by those who take this class of baths. Warm water also relaxes the skin. Very hot water is derivative and a stimulant. Hence, let a person having a headache and cold feet and hands get into my bath-tub, or their own, on their knees, with 15 inches depth of water, as hot as their flesh can possibly bear, bending over, rest the arms in the hot water to the elbows until both arms and feet are red. Then in this hot water frilly wash the whole body, having the room warm; step out, and kneeling by the smaller tub, pour slowly across the forehead, top-head, temples and eyes a gallon of cold water; follow that by a dash along a hand-width of your spine; wipe dry, dress, sit right down to and eat a good breakfast of any relishable good food, and have a clear head and warm feet all day. Follow this up twice a week, and avoid a thousand aches and pains and worries that are fast becoming the rule of the average American woman's life. Boys and girls very soon learn to love these comfortable baths, and volunteer to fill the boiler and lay the wood over night, ready for the touch of a match in the early morning.

The only cost of our bath-room was \$1 for the cask, a half day's extra work and two panes of glass.

During the past three weeks of cool weather persons have come two and a half miles to take a tub sweat to break up a cold, and to learn how to get up the simple arrangement at home—a corner of the kitchen, half of the stove, or one side of it, and the use of the hearth. The disposition and will to have it, and you will make this way without delaying breakfast, or being late to school or work. Try it!

SUBSTITUTE FOR SEA BATHING.—People who have no opportunity to enjoy sea bathing will be glad to know that a substitute, nearly if not quite as strengthening, is found in an ammonia bath. A gill of liquid ammonia in a pail of water makes an invigorating solution, whose delightful effects can only be compared to a plunge in the surf. To weak persons, this is recommended as an incomparable luxury and tonic. It cleanses the skin and stimulates it wonderfully, and leaves the flesh as firm and cool as marble. More than this, the ammonia purifies the body from all odor of perspiration. Those in whom the secretion is unpleasant, will find relief by using a spoonful of the tincture in a basin of water, and washing the armpits with it every morning.

POOR FLOUR.—Dr. Cutter says that the increase of nervous diseases, decaying teeth, premature baldness and general lack of muscular and bone strength are greatly due to the impoverished quality of flour now in use, the gluten being thrown away in order to make the flour white. He urges the use of unboltheaded flour, and of eggs, milk and butter. He denies that fish is brain food, or that Agassiz ever said that it was, and claims that butter, being nearly all fat, is a better kind of brain food than any other.

FRUIT FOR ALL.—Nursing women are often forbidden to eat acids, or acid fruits, lest the milk should turn sour. Vegetable acids, as soon as they are taken up into the blood, are converted into alkaline carbon long before they reach the milk glands, therefore their acidity is destroyed. Instead of being avoided, ripe fruits in moderation are extremely desirable as articles of food for nursing women.

REMEDY FOR CORNS.—Mr. Gezow, a Russian apothecary, recommends the following as a "sure" remedy for corns, stating that it proves effective within a short time, and without causing any pain: Salicylic acid, 30 parts; extract of cannabals indica, 5 parts; colloidion, 240 parts. To be applied by means of a camel's hair pencil.

The Week.

At last we have been favored by rain in California. After it had held off for so long as to cause some little alarm and fears of a dry season, showers fell on Tuesday morning early and at 9 P. M. .31 inch had fallen, making a total for the month and season of .32 inch. In 1879, to a corresponding date, .26 inches fell, and in 1878 2.40 inches. Rain was reported in places as far north as Red Bluff and as far south as Visalia.

In accordance with the usual custom, and the proclamation of President and Governor, we devote one day on this week to Thanksgiving. California can well afford to do this, for the past year gave her a most abundant wheat crop, a good grape harvest, and a generous yield of gold. True, her manufacturing interests flag a little, but they are as yet comparatively small. More attention is now being turned to them, however.

A noticeable event in the week has been the conclusion of a treaty with China, the terms of which are referred to elsewhere in this number of the PRESS. From the mines no news of special moment is stirring. The Imperial mine, on the Comstock, caught fire this week, but the fire has been happily extinguished. A more serious question is that of the water. The Yellow Jacket group of mines will be partly flooded till the Jacket pumps are ready to start up again.

The total coinage of standard silver dollars under the act of February 25th, 1878, has been \$72,847,758. Of this, \$47,588,106 are in the Treasury and in the Mints, and \$25,259,644 in circulation.

The Richmond Con. mine is turning out about \$25,000 per week.

For the week ending on the 5th, the bullion

Our Coal.

Coal, at any time, is a very important substance in the economies of civilization, but when at normal prices the majority of people seldom think of it, taking it as a necessity that comes like anything else. When, however, from any cause, either lack of supply, high transportation, or "corners," its price rises suddenly, then the people begin to think something about it—where it comes from; how it is obtained, and why they have to pay higher rates at one time than another.

On this coast we are peculiarly situated as to coal. In fact, nature seems to have slighted us in this respect. On the eastern coast of North America coal is most abundant, and not only abundant in quantity, but excellent in quality. Here we have mines of gold, silver, copper, and, in fact, almost everything except coal. Of course we have some coal, but the fields of the western coast of North America are limited in extent. Mr. Goodyear, formerly of the State Geological Survey, tells us that our beds are of comparatively recent geological origin. They are none of them of the carboniferous age, and, indeed, so far as yet known, none of them date back of the cretaceous period.

The beds mostly furnish a non-caking bituminous coal, which belongs to the class of lignites, or brown coal. Vancouver's Island, however, produces caking coal; and some caking coal of good quality has also been found in Washington Territory; but no workable mine of anthracite has ever been discovered on this coast, and the little that has been found, has proved on investigation to have been the result of local and special metamorphism.

Of the two States and one Territory which border on the Pacific coast between Mexico and British Columbia, Washington Territory is by far the most liberally supplied with coal. Oregon comes next and California last.

In fact, California is decidedly unfortunate in the extent and character of her coal fields. For, although it is easy to find coal at many localities in the Coast range from one end to the other, as well as at certain points in the western foothills of the Sierra, yet it generally happens either that its quality is poor or the quantity is small, or else that it is situated in the heart of the mountains, so far from market that the cost of transportation alone would far exceed the value of the coal.

Our Mt. Diablo coal, which is mainly used for steam coal in this city and on the steamers of the bay, is of poor quality, and, owing to its sulphur, is disliked for domestic purposes.

The Coos Bay coal field covers several hundred miles of territory, stretching from the Umpqua river on the north to points beyond the Coquille river on the south, and extending back from the coast to from 15 to 20 miles interior. The country is covered with a heavy growth of timber. The coal to be mined at a profit must be of good quality, favorably situated for cheap mining and very close to navigable waters.

The coal mines of Washington Territory are situated at Bellingham Bay close to the British Columbia line, and in the vicinity of Seattle on the eastern shore of Puget sound. The Seattle coal field is one of the most important on the coast, and covers a large area. Some of the best coal on this coast comes from Nanaimo, British Columbia or Vancouver Island. Our Wellington coal comes from here, and is considered a first class coal. The Rocky mountain coal fields in view of the present scarcity of coal are to be worked more energetically. The Central Pacific Railroad Company are soon to send on an additional 40 car loads per day, beside the 60 car loads already being sent. About 100 miners left Virginia city on Sunday to go to these mines. Men are not hired by the day or month, but are paid in accordance with the amount of work they do. They receive 74 cents per ton for cutting down the coal, the company then taking it and hauling it out of the mine.

The importers of coal in this city say that the rise in the price can be attributed only to one fact—the scarcity. The supply is less, they say, by 200,000 tons, than is usual at this season of the year. This is owing to the extension of the Southern Pacific railroad and the difficulty of getting ships to carry coal to this market. The Seattle Coal Company, it is said, is behind 20,000 tons with its contract with the railroad company. Some of the prominent coal dealers on being interviewed deny the existence of any corner. They say there is no combination among the wholesale dealers to make a corner and force up the price of coal. The rise was simply the effect of an inefficient supply and the great advance in freight of \$4 and \$5 per ton. Indeed, freightage was difficult to be obtained at any price, and it was more than probable that another rise of a dollar or two on a ton would soon be a necessity. Instead of this condition of things being an advantage to the wholesale dealers, it was the reverse of that. The quantity of coal now on the way here is said to have been greatly exaggerated. We are told, moreover, that there is little chance of any lowering of price for some months to come.

One good thing about this rise is that we shall soon have steam colliers. Arrangements are being made to build one already. This would be a good use to put some of the big steamers lying idle in the bay, as out of date for passenger service.

would not only prove a great benefit by reducing the prices paid by household consumers, but would be a great advantage to manufacturing enterprises.

Weekly Mining Reports.

Mining superintendents in this State should recollect that there is a law requiring them to make out every week a sworn statement as to the state of the mine, etc., and requiring the trustees to make out a monthly sworn statement of receipts and expenditures. The penalty for non-conformity with the law is a fine of \$1,000. There have been several suits of late for neglect to comply with the provisions of the law, and any company is liable to get into trouble if any stockholder chooses to make trouble. As the law reads it makes no difference whether the mine is worked or not. As there has been so many apparent evasions or so much neglect of this law of late it will be well for superintendents and trustees to bear its provisions in mind. We therefore give the full text of the bill as it finally passed the legislature and was signed by the Governor. It is as follows:

SEC. 1. It shall be the duty of the secretary of every corporation formed under the laws of this State for the purpose of mining, to keep a complete set of books, showing all receipts and expenditures of such corporation, the sources of such receipts and the object of such expenditures, and also all transfers of stock. All books and papers shall at all times during business hours be open to the inspection of any bona fide stockholder; and if any stockholder shall at any time so request, it shall be the duty of the secretary to attend at the office of said company at least one hour in the day out of regular business hours, and exhibit such books and papers of the company as such stockholder may desire, who shall be entitled to be accompanied by an expert; and he shall also be entitled to make copies or extracts from any such books or papers. It shall be the duty of the directors on the first Monday of each and every month, to cause to be made an itemized account or balance sheet for the previous month, embracing a full and complete statement of all disbursements and receipts, showing from what sources such receipts were derived, and for what and to whom such disbursements or payments were made, and for what object or purpose the same were made; also, all indebtedness or liabilities incurred or existing at the time, and for what the same were incurred, and the balance of money, if any, on hand. Such account or balance sheet shall be verified under oath by the president and secretary, and posted in some conspicuous place in the office of the company. It shall be the duty of the superintendent, on the first Monday of each month, to file with the secretary an itemized account, verified under oath, showing all receipts and disbursements made by him for the previous month, and for what said disbursements were made. It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him, and for what purpose, and the rate of wages paid to each one. He shall attach to such account a full and complete report, under oath, of the work done in said mine, the amount of ore extracted, and from what part of the mine taken, the amount sent to mill for reduction, its assay value, the amount of bullion received, the amount of bullion shipped to the office of the company or elsewhere, and the amount, if any, retained by the superintendent. It shall also be his duty to forward to the office of the company a full report, under oath, of all discoveries of ore or mineral-bearing quartz made in said mine; whether by boring, drifting, sinking or otherwise, together with the assay value thereof. All accounts, reports and correspondence from the superintendent shall be kept in some conspicuous place in the office of said company, and be open to the inspection of all stockholders.

SEC. 2. Any bona fide stockholder of a corporation formed under the laws of this State for the purpose of mining, shall be entitled to visit, accompanied by his expert, and examine the mine or mines owned by such corporation, and every part thereof, at any time he may see fit to make such visit and examination; and when such stockholder shall make application to the president of such corporation, he shall immediately cause the secretary thereof to deliver to such applicant an order, under the seal of the corporation, directed to the superintendent, commanding him to show and exhibit each part of said mine or mines as the party named in said order may desire to visit and examine. It shall be the duty of the superintendent, on receiving such order, to furnish such stockholder every facility for making a full and complete inspection of said mine or mines, and of the workings therein. It shall be his duty also to accompany said stockholder, either in person, or to furnish some person familiar with said mine or mines to accompany him in his visit to and through each mine or mines, and every part thereof. In case of the failure or refusal of the superintendent to obey such order, such stockholder shall be entitled to recover in any court of competent jurisdiction against such corporation the sum of \$1,000, and traveling expenses to and from said mine as liquidated damages, together with costs of suit. In case of such refusal it shall be the duty of the directors of such corporation forthwith to remove the officer so refusing, and thereafter he shall not be employed directly or indirectly by such corporation.

SEC. 3. In case of the refusal or neglect of the president to cause to be issued by the secretary the order in the second section of this act mentioned, such stockholder shall be entitled to recover against said president the sum of \$1,000 and costs, as provided in the last section. In case of the failure of the directors to have the reports and accounts current made and posted as in the first section of this act provided, they shall be liable, either severally or jointly, to an action by any stockholder in any court of competent jurisdiction complaining thereof, and on proof of such refusal or failure, such complaining stockholder shall recover judgment for \$1,000 liquidated damages, with costs of suit.

SEC. 4. All acts and parts of acts so far as they do conflict with this act are hereby repealed.

SEC. 5. This act shall take effect from and after its passage.

Water in the Comstock.

The water in the deep Comstock mines has always been the worst feature they have had to contend with. The expense of constructing and operating the pumping machinery has been enormous, and it has been in many instances the cause of assessment after assessment. In fact it is the greatest of the great expenses of mining up there. It has been all they could do a great deal of the time to keep some of the more prominent mines free, working as rapidly as possible with the pumps, and whenever an accident of any kind occurs to the pumping machinery the water gains so fast that the lower levels are flooded and great damage is done; and the flooding of one means the flooding of others in the same group where the water flow is very heavy. A case of this kind has just occurred on the Comstock. Last week the Yellow Jacket pumping machinery became disabled, and the pumps had to stop. They set two baling tanks to work, which had a combined capacity of 2,400 gallons, and hoisted about 266,700 gallons of water in 24 hours. These tanks were run at utmost speed, but the work was very hard on the cables, breaking the wires used in sawing between the strands. This had therefore to be stopped. The Belcher and Imperial pumps were set at work. The Enterprise is of the opinion, however, that there is too much water in the Jacket group of mines to be handled by all the pumping power that can be brought at present to bear upon it. A meeting of the different superintendents was held, and the prevailing opinion is that economy and good judgment demand that the expensive baling and pumping be stopped. The Gold Hill News says there is talk moreover of stopping all these operations until connection is made between the Jacket and the south lateral of the Sutro tunnel. This branch will be up to the Jacket, at all events, about March. The connection could be made by working both ways in about two and one-half months. It will take about two months to rig the Jacket up again. The talk now is of starting in on the Jacket and running north on the tunnel level with all speed, making the connection as quickly as possible, dropping the Jacket upper pumps, completing the double column from water line to that level and, when another attack is made on the water with these advantages, it could be easily and quickly conquered. That connection would be of benefit to the mines by means of connections as far south as the Caledonia.

The stopping of the tanks at the Jacket is virtually the abandonment of the lower levels of the Exchequer, Alpha, Con. Imperial, Confidence, Kentuck, Crown Point and Belcher to the flood and the stopping of all prospecting in these mines for a month or more, probably considerable more.

Concerning the situation the News says: "This pumping and baling is very expensive business. The Jacket has been consuming 27 cords of wood per day, and besides running pumping engines it takes a great deal of compressed air at the Con. Imperial and Point and Belcher to run donkey pumps to raise water to higher levels where it can be got rid of by sending it to other pumps. Then the mines will only be delayed and not injured by allowing the water to come in and remain till the Jacket completes its repairs. It is a risky business—this pumping steadily for a month or two with the certainty that if, as is almost probable, just before the end of that period should an accident occur to some of the machinery or rods all the work and expense will be lost. It is not probable that the water, if given its way, will raise very high. Con. Imperial has a head at the 2000 level, but will take care of that itself in any event. The 2400 of that mine is dry and only a little water is found on the 2600. Exchequer has, on the 2800 level, about 8 inches of it. It is not probable, therefore, that it would come above the 2500 of that mine, as the influx from other mines is low down."

The Enterprise is of about the same opinion, saying that when the Jacket tanks are stopped it will be useless for the Belcher and other companies to pump, and it will really be better for stockholders and all concerned to let the water come up to its level and stand there until the Jacket pumps are ready to start up again. Working as they have been doing, they might have been able to reduce the water sufficiently to allow of something being done on the lower levels, but the breaking of a pump rod would, at any time, result in a loss of all

The Treaty With China.

The "Chinese question," which, to a certain extent was considered a local matter before the recent campaign, was, during that epoch, brought so prominently before the people of the United States, that it has become national.

On this coast, however, where it has been from force of circumstances more prominently brought forward before the people, it is better understood than in the East. When, therefore, United States Commissioners were appointed to revise the treaty with the government of China, the population of the Pacific coast was more deeply interested than others.

The telegraph now brings us news that a treaty has been concluded with China. While the text of the new treaty will not reach our Government for a month yet, the Department of State has received enough by telegraph to indicate its nature. Until ratified the treaty cannot be made public. It is understood that this document does not change the status of American citizens in China, nor does it enter into the commercial features covered by the Reed treaty of 1858. It is a modification of the Burlingame treaty, and is in accordance with Evarts' policy, restraining further immigration of Chinese to this country, while at the same time not going to the extreme of sending those back who are already here. It is understood that the treaty provides that no master of any vessel owned in whole or in part by a citizen of the United States, or of any foreign country, shall take on board from any port in the Chinese Empire, or other foreign ports, any number of Chinese passengers, male or female, in excess of the number of 15, to bring them within the jurisdiction of the United States. Any master of a vessel who violates this clause of the treaty shall be considered guilty of misdemeanor, and subject to penalties to be provided for in the way of fine and imprisonment. It further stipulates that the master of any vessel arriving in the United States from any foreign place shall be required to furnish to the collector of the district in which he arrives a separate list of all Chinese passengers on board his vessel. This list shall be sworn to, and any evasion or misrepresentation under this stipulation shall also be considered a misdemeanor. The fines imposed upon the masters are to be considered liens upon their vessels. The provisions of the present statutes forbidding importation of coolies and women for immoral purposes are not affected by the treaty. No Consul or consular agent of the United States can grant a certificate to any vessel leaving China for this country if she has on board more than 15 Chinese passengers. Of course it is explicitly stated that the limitations do not apply to persons officially connected with the Chinese government, or to persons rescued from shipwreck. This treaty will undoubtedly be ratified at an early day by the Senate, and will be a measure to satisfy all but the most extreme of the anti-Chinese element on the Pacific coast. The treaty itself is a modification of articles 5 and 6 of the Burlingame treaty, which read as follows:

Article V.—The United States of America and the Emperor of China cordially recognize the inherent and inalienable right of man to change his home and allegiance, and also the mutual advantage of the free migration and emigration of their citizens and subjects respectively from the one country to the other, for the purpose of curiosity, of trade, or as permanent residents. The high contracting parties therefore join in reprobating any other than an entirely voluntary emigration for these purposes. They consequently agree to pass laws making it a penal offense for a citizen of the United States or Chinese subject to take Chinese subjects either to the United States or any other foreign country, or for a Chinese subject or citizen of the United States to take citizens of the United States to China or to any other foreign country, without their free and voluntary consent, respectively.

Article VI.—Citizens of the United States visiting or residing in China shall enjoy the same privileges, immunities or exemptions in respect to travel or residence as may there be enjoyed by the citizens or subjects of the most favored nation, and reciprocally, Chinese subjects visiting or residing in the United States shall enjoy the same privileges, immunities and exemption in respect to travel or residence as may there be enjoyed by the citizens or subjects of the most favored nation. But nothing herein contained shall be held to confer naturalization upon citizens of the United States in China, nor upon the subjects of China in the United States.

GEN. SCHOFIELD has asked to be relieved from the command of the Department of West Point. There is talk of assigning Gen. Miles there instead of to the Signal Service.

Scenes in Alaska.

In our last issue we made some remarks concerning the mines of Alaska. There is little doubt that in the broad area of the Territory yet to be prospected mining ground will be discovered. Certain parts of the country have been prospected, but by far the greater area has never been examined. The proposed expedition to the upper part of the Yukon river next season may develop something. Alaska is by no means the mass of snow and ice many people imagine. There is more or less rain, but the summers are pleasant, and the winters, at Sitka at least, are by no means extremely cold. There are other parts of the United States every bit as cold and colder. Until last winter the "oldest inhabitant" of Sitka had never known the thermometer to record more than

looks the bay from a fine elevation. Sitka is the principal, and, in fact, only town of any importance in Alaska.

GRASS VALLEY MINING DISTRICT.—The Union gives its usual monthly review of mines in that district. It mentions 14 quartz properties, including all the better known ones. In the list are the following mines that are producing ore regularly: Idaho, New York Hill, Rocky Bar, Sebastopol, Empire, Alpha and Ford & McDonald. There are several important prospecting enterprises under way, most of which are likely to yield good results hereafter. As a preface to its description, the Union observes: There are at the present time more prospecting companies at work and more mines working under regular system than at any time within the past six or eight years. This mining is mainly being carried on by our own people, as a legitimate industry, with no view to speculative purposes or to get up wildcat schemes to float on

SITKA, ALASKA TERRITORY.

four degrees below. Last winter it recorded twelve degrees below.

Our new Territory at the north is just now attracting more attention than ever before because of its varied resources and wonderful scenery. It is a country of wonderful forests and rare floral growths. It is the abode of living glaciers which are continually shunting off icebergs. The waters are almost alive with fish,

San Francisco or Eastern markets. It has always been a marked feature of mining at Grass Valley that it has been mainly conducted by home capital and by home miners, and but little effort even made to induce outside capital to come in. It is an interesting historical fact that the first discovery of gold in quartz was made in this district, and the first quartz mining and milling was done here. That was in the

A VIEW OF THE BAY OF SITKA.

and the land is disclosing much mineral wealth. In short, it is a most interesting possession, and one which will ere long be much better known to our people. The literature of Alaska is soon to be enriched by the new book by E. Conklin, entitled *Picturesque Northwest*, in which considerable space is given to facts and pictures of Alaskan resources and scenes. This work is soon to be published by the Continent Stereoscopic Co., of New York. In advance of publication, we have secured the right to reproduce some of the engravings, from which we give a selection on this page.

The Bay of Sitka is a beautiful body of water—studded with islands in most picturesque arrangement, which leads the eye well out upon the northern sea until the waters are lost in the horizon, end sea and sky commingle. We have visions of a Grecian Archipelago and an Italian sunset. Everyone who has ever visited Sitka admires its bay. It is very well protected on all sides, and its many islands give it a picturesque character. The town of Sitka over-

year 1850, and from that time until the present, gold quartz mining has been the chief industry and maintenance of the district.

THE STATE MUSEUM.—Mr. Henry G. Hanks, our efficient State Mineralogist, is busy preparing a report for the Governor and Legislature, which will contain a great deal of interest to the mining community. Among other things there will be a history of mining in California. The salary paid in the office of the Bureau at present are, State Mineralogist, \$3,000 per year; Secretary, \$150 per month; Chemist, \$125 per month; Janitor, \$75 per month. The museum contains 40 glass cases with 2,000 classified specimens.

SIXTY THOUSAND immigrants arrived at the leading ports of the U. S. during October, and despite the Irish troubles, nearly a thousand more English than Irish came, and three times as many Germans as Irish.

Labor in San Francisco.

San Francisco is peculiarly situated as respects its labor market. Being the only large city on the coast, the terminus of railway and steamship systems, it is continually receiving accessions to the number of unemployed laborers. People from the country send to the city for "help," and the "help" comes to the city when they want employment in the country. Again, whenever there is any dull times in the interior, those persons without permanent occupations come, when they can, to the city to find work. The men who have, during the summer, made a "stake" working in the fields, in the mines, or in the timber, come to the city to spend their earnings. These spent, they again join the army of the unemployed. It was only the other day we heard of 50 or 60 men engaging to go to Arizona to work for a dollar a day. These men of course accepted such wages only from necessity, and in order to have something to do. They were no doubt men who had been long waiting for jobs. The winter months usually bring numbers of laboring people to the city. We have, therefore, to take care of or look out for a very large proportion of unemployed people who do not really belong in San Francisco, but who are better off here than in small country towns.

It is to be hoped that not many years will elapse before we have a better system of small farms than now seems possible. When this happens there will be fewer of these floating laborers. Another thing we sadly need, is the formation of manufacturing establishments in our interior towns, so that they will get a class of people who have more permanent employment than harvesting gives.

We are led to these remarks by reading the report of the *Free Labor Exchange* of this city. The manager, Mr. G. W. Schroeder, says: "The great stagnation of business during the winter months, with corresponding lack of demand for help in the male department, was followed by an unusual demand for help during the whole summer, principally for farm hands and day laborers. The demand for such help

has been generally in excess of the supply, standing orders for 70 and 80 farmers being kept up for several weeks without being filled. There has consequently been an increase of over 50% in the orders and engagements this year, as compared with last."

This illustrates our greatest difficulty. That is, we are short of laborers in the summer, and have more than we want in winter, and this the city feels more than the country.

In referring to female help, the report above alluded to says: "The demand has always been for twice as many girls as could suitably fill the orders. Every one, young or old, who was willing to assist in housework or take care of children, could always get \$10 a month and board. For nearly all occupations in this department, the demand continues for young, neat and reliable girls with references." Caro is taken in the selection of competent and sober help. The following is the summary of transactions for the year:

Male Department.—Number of orders received, 1,119; number of persons called for, 1,750; number of persons engaged, 1,270. Nationalities—Irish, 383; English and Scotch, 38; Scandinavians, 26; Americans, 545; German, 141; various nations, 137. Occupations—Laborers, 370; farmers, 131; carpenters, 55; cooks, 41; waiters, 60; dishwashers, 64; general usefulness, 108; boys, 83; various occupations, 358.

Female Department.—Number of orders received, 2,387; number of persons called for, 2,507; number of persons engaged, 1,213. Nationalities—Irish, 515; Americans, 456; English and Scotch, 24; Germans, 47; Scandinavians, 22; other nations, 149. Occupations—Nurse girls, 156; assistants, 180; chambermaids and waitresses, 49; cooks, 24; general house work, 613; various occupations, 191.

Total number engaged in both departments, 2,483. Total number of persons engaged during the three years, 8,038.

RIVETED CLOTHING PATENT.—In the case of Levi Strauss & Co., of San Francisco; vs. H. W. King & Co., of Chicago, for infringing plaintiff's patent on riveted clothing, Judge Blatchford has entered a final decree giving plaintiff a perpetual injunction and \$30,000 damages. We gave the full text of the decision in favor of Levi Strauss & Co. when it was rendered. The original patent for this riveted clothing was procured through the agency of Dewey & Co., publishers of this journal, and we feel pleased to see that it has stood the test of the Courts so thoroughly.

SIERRA BUTTES QUARTZ COMPANY, Sierra county, are working 190 men, and have two mills constantly crushing rich quartz.

Cotton Growing.

This year's experience with cotton growing in the upper San Joaquin valley will in all probability lead to a wider planting next year. There has been talk about the immediate erection of cotton mills by the capitalists upon whose lands in Kern county there was a satisfactory test crop grown this year, but these rumors are premature and are repudiated by the men who have been credited with the intention to manufacture. It is too soon to build cotton mills in this State, for the product is not yet large enough. It is probable that our woolen mills will need all the cotton that can be grown here for a year or two to incorporate in their "all-wool" fabrics, and, so long as the local demand takes the crop, it is not likely that growers will be restless to test the problem of manufacturing. It is, however, quite likely that, if growing proceeds, there will be an introduction of the new style of cheap cotton mill, which, by the use of the Clement attachment wheel, we described some months ago, will work the material into thread directly from the boll.

The great cotton interest of the United States seems to be in quite a prosperous condition and production has increased so that ante-war figures are largely exceeded. It is stated by Eastern authorities that the 15 crops since the war were greater than the 15 crops before the war by 9,500,000 bales, worth fully \$600,000,000. The crop of 1880 promises to be one quarter greater than any crop before the war. This item of progress and prosperity in the South must be gratifying to all lovers of the country. It is to be expected that the volume of the new census which will treat of cotton production will bring to light a vast amount of information which will serve the whole growing industry.

It does not appear that the wealth produced by the cotton plant is at all adequately realized, but that immense wastes occur which, in part at least, may ere long be turned to good account. The cotton growing industry as it might be is shown by Edward Atkinson, of Boston, as follows:

The present power of King Cotton is but the shadow of the substance yet to come. The value of the seed is yet an unknown quantity. It may seem almost the work of a visionary to compute it. If we make 6,000,000 bales of cotton fiber in a year, the weight of cotton-seed that will remain after enough has been set aside for the next year's planting will be 3,000,000 tons. If the whole of this seed be treated as a small portion is now treated, this seed will give the following results: About 90,000,000 gallons of oil, about 1,300,000 tons of oilcake or meal, about 1,500,000 tons of hulls, from which there is every reason to suppose from experiments here, and actual use elsewhere, that 750,000 tons of paper may be made. Otherwise these hulls ground into meal with the oilcake will serve as food for stock—2,800,000 tons in all. Each ton of this ground meal would carry at least five sheep six months, the rest of the year they would have ample food from the annual grasses that are the pest of the cotton planter, or from corn-fodder, cow-peas, or other refuse or alternate crops. The waste of the cotton gin, and of the oil press, with other waste of the cotton farm, will, therefore, suffice for not less than 14,000,000 to 20,000,000 sheep, probably for double that number. These sheep, folded upon the cotton fields, would so fertilize the soil as to double the crop of cotton on any given acre of uplands—the manure of animals fed on cotton-seed meal being richer than that from any other known variety of food.

Mr. Atkinson suggests that there be held at some future time a grand exhibition of the products of the cotton plant and the machinery employed in their preparation and manufacture. The suggestion is a good one and it would seem fitting to fix upon the New York world's fair of 1883 as the proper occasion. By that time the present cotton experiments of California will have reached some results and if favorable it will be a good opportunity to show our cotton to the world.

Exploring a Big Cave for Wealth.

The mining claim known as the Park County, located on Twelve-Mile creek, two miles this side of Platte station, has been the scene of a truly remarkable subterranean development. Messrs. Bergh & Stark own the claim and have been exploring an immense body of iron that was discovered during the Platte station excitement of last summer, in the hope of striking a hedy of pay mineral. One day last week a shot put off in the bottom of the shaft, at 80 ft. from the surface, revealed the opening of a large cave. Immediate arrangements were made to explore it, and it is now ascertained that the cavern is of great extent and wonderful beauty in parts. It is in the form of a tunnel varying in width from 2 to 10 ft. The roof sometimes hangs so low as to compel a stooping position on the part of the explorer and again stretches up to a vast height, so that a candle held high over the head does not reveal the roof. When it can be seen, beautiful stalactites cover it and give back brilliantly reflected lights. The distance along this subterranean cavern has been determined, by actual traversing, to be not less than 175 ft., while several small apertures leading off from it indicate more caves beyond the points that are of easy access. Openings will be made in order to see if such do not exist. Of course, aside from the curious points of this unexpected discovery, there rests in the minds of the owners a hope that it will lead to the finding of mineral beds. So far, the most careful search has failed to reveal more than slender indications of mineral, but it will be carried on until no doubt of its presence or absence remains.—*Fairplay (Col.) Flume.*

For the week ending Nov. 12th, the bullion shipment from Salt Lake amounted to \$161,640.

Forwarded (post-paid) from the MINING AND SCIENTIFIC PRESS Office, by
DEWEY & CO.

MOREY & SPERRY.

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores (Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also.

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

GOLD SAVING
SILVER PLATED

Amalgamating Plates,
FOR QUARTZ MILLS AND GRAVEL CLAIMS.

Scientific and Practical Books
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &
CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Millman, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or-
der. It contains 120 diagrams, illustrating machinery
etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without
Quicksilver. 1880.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed full
of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country and in
Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces,
implements and working apparatus.
It is a work of great merit, by an author whose reputation
is unsurpassed in his specialty.
Price, \$3.00 coin, postage free.

usual expense. GROOVED RIFFLES—Hydraulic or quartz.
Will largely increase the yield of gold. Concentrators No.
1 and 2. Former without machinery. Latter for fine Gold,
Sulphurets or Black Sand. BRYAN TYSON, Patentee.
Manufactured by Rankin & Co., Pacific Iron Works.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

The following Canadian patents have been issued to Pacific Coast inventors.

11,437.—COLLAPSIBLE VALVE.—Wm. Wilson, Oakland, Cal.
11,605.—FIBER DECORATOR.—Thomas Threlfall, S. F.
11,704.—BARK PANS.—Charles Jackson, S. F.
11,780.—ROCK DRILL.—H. Richmann and U. K. Arnold, S. F.

11,816.—EXPLOSIVE COMPOUND.—A. Munnir, S. F.
Notes.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Miller et al., vs. Smith et al.

United States Circuit Court, District of Rhode Island. Decided October 7, 1880. Clifford, J.:

1. The introduction in evidence of letters patent affords a *prima facie* presumption that the patentees is the first and original inventor, and is sufficient to entitle the complainants to a decree, unless it is overcome by competent proof of greater weight.

2. Regulations and provisions applicable to the obtaining or prohibition of patents for inventions or discoveries, not inconsistent with the existing Patent Act, apply to patents for designs, without modification or variation.

3. Exhibits introduced by a party without needful explanation, do not deserve, and will not receive much consideration.

4. When the defense of want of novelty is made, it is the duty of the tribunal, whether court or jury, to give it effect; but such proof or testimony, should be weighed with care, and never be allowed to prevail where it is unsatisfactory, nor unless its probative force is sufficient to outweigh the *prima facie* presumption arising from the introduction of the patent.

5. In the case of a design, as well as a mechanical patent, mere delay in applying for a patent will not forfeit the inventor's right to the same, or present any bar to a subsequent application, providing the invention had not been in public use or on sale two years before the filing of the application.

6. A patent for a design, consisting of letters of the alphabet having a described ornamentation is not bad because it embraces more than one letter.

7. While it is true that the test of infringement in respect to the claim in a design patent is the same as in respect to a mechanical patent, it is not essential to the identity of the design that it should be the same to this eye of an expert.

8. If to the eye of the ordinary purchaser the designs are substantially the same, if the resemblance is such as to deceive such an observer, and sufficient to induce him to purchase one, supposing it to be the other, the one first patented is infringed by the other.

Decree for complainants.

COMMISSIONER'S DECISIONS.

Brown vs. La Dow.

Appeal from Examiners-in-Chief. Decided October 23, 1880. Marble, Comr.:

1. Under the statutes and rules the only question presented to the Board of Examiners-in-Chief on an appeal from the Examiner of Infringements, in which the parties to the controversy is the prior inventor.

2. The Board, by undertaking in its decision to show that the inventions declared to be in interference were not the same, and treating the issue between the parties as a "fictitious one," and rendering a decision on such alleged fictitious issue, exceeded its jurisdiction.

3. The question of interference had been twice before the Commissioner on motion, and each time decided affirmatively, and the Board was guilty of an impropriety in thus re-opening the question in its decision.

4. If the Board, upon an examination of a case, is of the opinion that the devices do not interfere, it is its duty, under rule 134, to call attention to that fact, by a statement annexed to its decision, not a part of it.

5. It is sufficient always for an appellate tribunal to consider the questions before it in the form presented by the appeal, and although the Commissioner and Board may look beyond the questions so raised in considering the case, still no decision affecting the rights of the parties can be made upon any question not involved by such appeal.

6. If reasons are discovered by the appellate tribunal, showing *prima facie* that a patent ought not to issue, this case must be returned to the Primary Examiner for his consideration, and the party to be affected thereby must have an opportunity to show if he can, why such reasons should not operate against him.

7. Where the rules of practice have been clearly indicated and determined, there is no reason why any officer of the bureau should fail to observe them.

The decision of the Board is overruled and priority of invention awarded to Brown.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BOOK HOLDER.—Wm. B. Dangharty, Carson City, Nev. Patented Nov. 16, 1880. No. 234,460. This invention relates to a novel device for holding an open book, the device being hung from the shoulders of the reader in such a manner as to have the book in proper place for reading, allowing the reader to assume any position he may desire, and leaving his arms and hands free. It consists of a base upon which the book rests, and from the sides of this base are two curved arms which are so formed as to hook over the shoulders of the reader, and are properly braced to hold the base in the same relative position, whether the reader is in a sitting, standing or reclining position. This device is very convenient, as the reader may have his hands free for writing or other occupation, and

THILL COUPLING.—Levi B. Lathrop, Hollister, California. Patented Nov. 16, 1880. No. 234,591. This device consists in certain details of construction, combined with an independent holding-seat or plate, within which an elastic block may be supported beneath the joint which unites the thill or pole to the vehicle to prevent rattling. This independent seat is provided with a V-shaped projection from its lower surface, which fits into a corresponding groove in the clip-bar, the front end of which is extended out beneath the seat so as to support it, and so that when the rubber becomes worn, the seat and rubber may be raised to make a close fit, by screwing up the nut upon the front clip-bolt without other device or attachment.

HAY PRESS.—Ben. W. Watts, Los Angeles, Cal. Patented Nov. 16, 1880. No. 234,509. The improvements herein made consist in certain details of construction by which the power is applied to the follower for pressing the hay while the press is traveling from one cock to another, avoiding the necessity of unhitching the team when pressing a bale; and there is also an improved means of preventing lateral spreading of the body by the bar which controls the corners. By this construction a hay may be pressed while traveling from one cock to the other, and it is never necessary to unhitch the horses and connect them to a hall-wheel rope.

Wood Getting Scarce.

While we are grumbling here at the rise in price of coal, people in other parts of the States and in Nevada are likely to join us about their fuel—wood. We not ice that in Eureka, Nevada, it is currently reported among the charcoal men that the over-supply is running short, and that a better price than 22 cents per bushel is to be looked for shortly. Partis largely interested in that line of business say that there is not enough manufactured on this ranches to supply the demand for the furnaces this winter, and very little will be made unless the price comes up to 30 cents per bushel. This will reduce profits in the mines to some extent, of course. It is not only there that this rise is occurring. The cost of wood along the line of the railroad on the eastern and western slopes of the Sierra has increased 10% the past year, and the prospect is that it will increase as much more the coming year. The Truckee Republican says: Every acre of timbered land in this region that is accessible, in the hands of the Government or railroad company, is worth all that is asked for it, and must increase in value every year hereafter, as long as the timber remains uncut. There is no safer or better investment than in timber lands. The people are availing themselves of this opportunity and thousands of acres are being taken up every year. The day is not far distant when the forests will be considered much more valuable than they are now.

BARBEE & WALKER.—The Barbee & Walker mine is one of those in the "sandstone district" of Silver Reef, Utah. It has now been for some time steadily shipping bullion, which is the best proof of what it is. The mine is owned by a New York company, but several Californians are interested. At a stockholders' meeting, held in New York recently, the following trustees were elected: Milton S. Latham, Elisha Riggs, William R. Garrison, J. Boorman Johnston and De Lacy Loucks. At a subsequent meeting of the trustees, Milton S. Latham was elected President; Elisha Riggs, Vice-President; the Mining Trust Company, Treasurer; De Lacy Loucks, Secretary, and R. L. Ogden, Superintendent. The latter is well known in this city, where he was formerly manager of the Kimball Carriage Works. We know of his having put a good deal of money into mines at different times, and are glad to see that he is now taking some out, for a change.

THE DODGE CONCENTRATOR.—The new concentrator invented by Mr. Miles B. Dodge is still doing very good work. The following result of the working of some highly sulphureted rock from Hornitos will serve as an example of its usefulness. The ore averaged \$12.55 per ton. A batch of 500 lbs. of this ore was worked which contained according to assay \$2.42 in gold. From this 634 lbs. of sulphurets was obtained, containing \$2.43. The tailings only showed traces. This is according to Kustel & Rott's assay. Numbers of people are witnessing the work of this machine at 143 Fremont street, every day.

ORE FEEDERS.—Joshua Hendy, manufacturer of ore feeders, has, in the last 90 days, sold 87 Challenge ore feeders, and some few of other makes. Many of these feeders were ordered to take the place of feeders of other manufacturers. This is an evidence of the appreciation of the Challenge, and an indication of the widespread use of mechanical ore feeders.

THE Homestake mining company has declared the usual dividend of 30 cents per share, and one extra dividend of the same amount, both payable at New York on the 26th. This is the third extra dividend in the past three months. In the past two years 26 dividends have been

CENTRAL PACIFIC EARNINGS.—The earnings of the Central Pacific Railroad Company for October, and for the first 10 months of the year, compared as follows:		10 Months.	
	October.	\$125,000	\$1,250,000
1880.....	\$214,000	\$1,250,000	\$1,250,000
1879.....	1,809,000	1,250,000	1,250,000
Increase.....	\$270,000		\$1,921,000

SMELTING WORKS BURNED.—The refinery and smelting works at Chellendam, near St. Louis, were burned on the 19th; loss, \$125,000; insurance, \$35,000. The fire was caused by the bursting of one of the smelting furnaces containing 25 tons of molten lead. John Williams, night engineer, while attempting to save his clothing was overtaken by the flames and burned to a crisp; 150 men are thrown out of employment. The works will be reconstructed.	
--	--

THE True Fissure (Candelaria) thinks the next mining boom will probably be at Gold Mountain. A great many people are going in there this winter, and there will be considerable of a rush next spring. The mines are all gold ledges. A mill is being erected.	
--	--

OWING to the increasing importance of the French possessions in the South seas, the naval stations of Tahiti will henceforth consist of a steam transport, and dispatch boat and sailing	
--	--

RAIN TABLE FOR SACRAMENTO—PREPARED BY THE LATE DR. T. M. LOGAN AND DR. F. W. HAYCH.

Arranged according to the seasons, showing the amount in inches of each month, during thirty-one years, and for each rainy season, to November 23d, 1880; also the quantity for every month, and the annual amount of rain.

News in Brief.	
CHIEF-JUSTICE COCKBURN of England is dead. The spinners are threatening a strike in Fall River, Mass.	
THREE shocks of earthquake at Los Angeles, on Monday last.	
THE population of St. Louis on the first of June last was 350,915.	
CALIFORNIA mine produced 657 tons of ore last week, assaying \$26.	
TWO HUNDRED prisoners in Kist, Russia, are down with typhus fever.	
THE eviction of the families of miners at South Moors, Eng., continues.	
THE Enterprise gun works at Pittsburg, were burned this week. Loss, \$35,000.	
THE port of Todos Santos, Lower California, has been declared open to commerce.	
THE agent of the Canadian government is seeking to induce Irish emigration to Canada.	
THE British ship, <i>Mildred</i> , has foundered in the Atlantic. Her crew of 23 were all drowned.	
A GREAT storm prevailed in Central Italy on 21 inst. A portion of Rome was submerged.	
J. MORA MOSS, one of the Regents of the University of California, died on Sunday last.	
THE activity of Mt. Vesuvius increases. The lava flows continually on the side towards Naples.	
TOM SCOTT says the Missouri, Kansas and Texas railway will commence its extension in 10 days.	
FRIENDS of Whittaker have petitioned the President to restore him to his former place and position.	
CARDINAL MANNING bitterly opposes the settlement of Jesuits within his archdiocese of Westminster.	
A DISPATCH from Dublin says the winter has set in severely. The whole country is covered with snow.	
SINCE January 1st the sum of \$5,967,538 has been placed out on real-estate mortgages by banks in this city.	
THE Directors of the Academy of Design of Chicago, have decided to build an opera house costing \$500,000.	
THE roads which are participating in the cheap-fare fight, agree in reporting increased earnings even in passenger business.	
J. L. KIMBALL, for the past 10 years general passenger agent of the Union Pacific R. R., will soon receive the appointment of assistant general manager.	
THE house of C. Boehringer, in Napa, was burned on Thursday and his two children were burned to death. The mother had left the children in the house alone.	
CHRIS. SCHMIDT, the well-known proprietor of the Hook Farm, near Marysville, the early residence of the late General Sutter, died on Monday night, aged 50 years.	
THE San Francisco Grand Jury have presented indictments for malfeasance in office against Mayor Killoch, Auditor Dunn and City and County Attorney J. L. Murphy.	
A BERLIN correspondent says that the socialists have resolved, in view of the violent means of repression employed against them, to abstain from voting at the political elections.	
THE sugar crop of Louisiana is estimated at 237,800 hogsheads, an increase of 71,000 hogsheads over last year. The molasses yield will exceed that of 1879 by 810,000 gallons.	
THE new Chinese treaty is said to be satisfactory to the Government. It modifies the Burlingame treaty in formulating provisions for limiting or regulating Chinese immigration.	
A MOUNTAIN fire near San Bernardino, on Friday last, destroyed the apiaries of Messrs. Segars and Kennedy. The former lost 40 stands of bees, and the latter 100 stands and his house.	
FOREST fires in the region of Laguna and Green valley, Santa Cruz county, have done great damage to timber, fences, bridges, etc. Davis & Cowell have lost an immense amount of wood.	
A BATTLE was fought in this new railroad town of Mattu, Dakota, on Thursday night between a band of desperadoes and a company of vigilantes. Arkansas Jos, the leader of the ruffians, was killed.	
THREE engines have arrived at Bakersfield from Tulare. They are a reinforcement to those stationed there that had become unequal to the task of pushing the increased freight trains over Tehachape Pass.	
SIR ALEXANDER T. GALT is now hard at work to assist emigration from Ireland to Canada. A syndicate has been formed to carry out this object, and preparations to develop the emigration to Canada on a great scale are going on favorably.	
A BLOCK of granite four and a half ft. in width and thickness, eight ft. in length, and weighing 16 tons, was received in Sacramento from Rocklin last Thursday. It is to be placed in position as one of the gate piers at Capitol park, of which there will be two similar ones at each opening.	
A LARGE number of Nihilist placards have just appeared upon the walls of St. Petersburg, some of them in the most frequented parts of the city. They proclaim in flaming characters the beginning of a fresh revolutionary movement, beside which all former agitations will be considered puerile and insignificant.	
CAPT. JOHN ERICSSON, of Monitor fame, is experimenting in New York harbor with a most destructive engine of war in the shape of a torpedo boat, and he is reported as being confident that no vessel now afloat in the world can successfully resist the attack of this new naval battery, which will deliver its charge of 250 lbs. of	

Nothing short of Unmistakable Benefits

Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SASSAPARILLA enjoys. It is a compound of the best vegetable alteratives, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for scrofulous, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humors, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weaknesses and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It tones up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been in extensive use, and is to-day the most available medicine for the suffering sick anywhere.

FOR SALE BY ALL DEALERS.

Australian Patents.

The attention of Pacific Coast Inventors is called to the benefits which may be derived from Letters Patent of the Australian Colonies. We invite correspondence from all who may desire full information on the subject. The geographical location of San Francisco gives an advantage in our favor over Eastern agencies, rendering it possible for us to transact business in much less time.

Send for our circular giving full information regarding Patents for the following countries: Victoria, New South Wales, Queensland, South Australia, Tasmania, New Zealand, East India, Etc., Etc.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

DIVIDEND NOTICE.**OFFICE OF THE****Eureka Consolidated Mining Company,**

Nevada Block, Room 87, San Francisco, Nov. 15, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 61) of Fifty Cents (50c.) per share was declared, payable on Saturday, November Twentieth (20), 1880. Transfer book closed until the Twenty-second (22) instant.

W. W. TRAYLOR, Sec'y.

Alpha Hydraulic Gravel Mining Company.

Principal place of business, San Francisco, California. Location of works, Alpha Hill, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Nineteenth (19) day of November, 1880, an assessment, (No. 2) of Twenty (20) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. gold and silver coin, to the Secretary, at the office of said company.

Any stock upon which this assessment shall remain unpaid on the Twenty-fourth (24) day of December, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JAMES IRELAND, Sec'y.

Office, No. 216 Sansome Street, San Francisco.

Land Purchasers Association.—Loca-

tion of place of business, San Francisco, California. Notice is hereby given that at a meeting of the Directors, held on the Ninth (9) day of November, 1880, an assessment of Five Dollars (\$5.00) per share (being a part of the 4th installment on the subscription to the stock), was levied upon the capital stock of this Association, payable immediately to the Secretary, at 318 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid, on Friday, the Tenth (10) day of December, 1880, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. S. WRIGHT, Sec'y.

N. B.—This assessment is to pay the taxes on the property of the Association for the current year.

M. B. DODGE,**First Premium.****STONE BREAKER AND ORE CRUSHER.**

IMPORTER AND DEALER IN

Assayers Materials, Chemicals**AND MILL SUPPLIES.**

Brass and Steel Wire Screens, Hardware and Fancy Goods, Opera, Field and Marine Glasses, Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling Companies is particularly called to the complete stock of Balances, Furnaces, Crucibles, Brass and Steel Wire Screens, etc., including all the necessities for Assayers and Miners, as also for Milling men. An experience of 30 years in this line of business enables me to guarantee a strict attendance to the orders which my friends may entrust to me. Gold and Silver Tables and a full list of articles to be found in my store, to be had on application.

PERMANENT BEER TAP.

This Tap can be used in any keg. Or be regulated to draw Steam or Flat Beer, and is self-locking when the key is taken out.

Brewers' Rights, State Rights or County Rights for sale.

FETTERLY & DUTTON,

Yolo, Yolo County, Cal.

Cups for Engine, Machine and Shaft Bearings and Loose Pulleys. We furnish the Albany Compound (a solid), \$1 worth of which will last as long as from \$2 to \$10 worth of Oil, with no stop, and with ONE-TWENTIETH the attention required by the best Oil Cups.

If the Cups are not satisfactory, we will receive them back and make no charge.

Cylinder corrosion is not so much owing to impure tallow or oil as to the fact that those animal fats do not maintain their integrity under steam heat, but decompose and set free acids which attack and destroy metal.

The Albany Cylinder Oil does not contain fatty acids—is incapable of being decomposed and does not form insoluble soaps.

If it becomes mixed with boiler incrustation it diminishes its tendency to cling to the sides of the boiler, and thus exerts in this respect also a beneficial action.

THE ALBANY Cylinder Oil

Is now in use throughout the world, and we refer to nearly all first-class establishments on this coast for evidence of its efficacy.

Pure Winter Strained Lard Oil

By every vessel from New York.

ALBANY SPINDLE OIL,

Genuine West Virginia Lubricating Oil,

SIGNAL OIL for outside lights of vessels, etc.

The Albany Lubricating Compound and Cups, the Albany Spindle Oil, etc., can only be gotten from us or our agents. Send for catalogue.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

TATUM & BOWEN,

329 Market Street, 3 Fremont Street

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Small Sizes made in Sections not to Exceed 300 lbs.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all, and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction. The Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OGDEN FOUNDRY, STEIGER & KERR, 137 First St., S. F.

"THE \$1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 600 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.
Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The cut illustrates the recently introduced Grip, and also the Spring Attachment, which replace the Weight heretofore used, and which is an obvious improvement.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeder is now in Use in the following Mills, besides many others

Superiority of the "Challenge" Demonstrated!

At the "Christy" (five-stamp mill), Uinta county, Utah, 30,000 tons of ore were run over one of the Challenge Feeders, when it was found to be somewhat worn, owing to the peculiar sandstone ore; and it was replaced by an "Eclipse" Feeder, which, after 30 days, during which time the stamps crushed only 35 tons per day, and the Feeder thus proving unsatisfactory, was discarded, and replaced by a new "Challenge" Feeder, with all of its latest improvements. The stamps are now crushing 45 tons per day, and the Feeder is working to our entire satisfaction. The ore is sandstone, crushing easily, so a good deal is put through in a day.

The Harshaw, or Hermosa Mill, of Patagonia District, Arizona, was originally fitted with four (4) "Eclipse" Feeders, which in a few weeks were found to be inadequate and unsatisfactory; and are now replaced by four (4) of the "Challenge" Feeders, which are giving entire satisfaction. The Silver King, Arizona, also removed Eclipse Feeders to give place to "Challenge."

The Solo Mill, of Brown's Valley, Yuba county, Cal., was originally fitted with two (2) of the "Victor" Feeders, manufactured by E. T. Steen; but owing to their insufficiency, they are now replaced by two (2) of the "Challenge" Feeders, which are working to the entire satisfaction of the owners of the mill.

In the Alexander Mill, Grantsville, Nev., four (4) of the and were replaced by four (4) of Hendy's Feeders, and four (4) more of the same pattern added when the second 20 stamps were erected. These cases are simply cited, from among many like instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. L. W. GREENWELL, of the Tingman Mine, El Dorado Co., or any other person can make \$1,000 by taking up my Challenge. I mean business. Gentlemen, 'put up or shut up.' I will give \$100 to any one who will get this Challenge taken up. I simply want a comparative test made on the nasal wet sticky ore as it comes from the mine.

An Illustrated Journal of Mining, Popular Science and General News.

SAN FRANCISCO, SATURDAY, DECEMBER 4, 1880.

VOLUME XLI
Number 23.

The engraving on this page represents one of the latest improved mining appliances invented in California, and one that in many respects is a very great improvement in its class. This air compressor was invented and perfected by Henry Richmann, of this city, and is manufactured by the Richmann Rock Drill and Compressor Company, at their works, 27 Stevenson street.

The steam cylinder is placed on the bed plate and has two piston rods connecting with cross slide above. The air compression cylinders on the upper plate also has double piston rods, which are connected helow to a cross slide. Gnide rods keep the motion of the alotted cross heads in line, sliding clamps fitting around these guides form the cross haad, and preventing lateral motion hy their peculiar construction.

Ordinarily the crank of the engine operates a shaft on which there is another crank for communicating motion to the piston of the air cylinder. This necessitates the air compressing cylinder being some distance from the engine cylinder and very much out of a direct line, and the air compressing appliance is correspondingly enlarged. There is also considerable torsional strain upon the shaft depending on its length. It was desired to make this compressor as compact and snug as possible and to bring the air cylinder in line with the steam cylinder as near as might be, at the same time providing a peculiar connection of the two pistons, whereby the greatest power of the engine is exerted as the air reaches its highest compression. This peculiar compound crank and connecting slides were therefore employed.

The air piston commences its return stroke before the engine piston has reached the end of its stroke, and the peculiar connection of the two cranks and their nutting arms with the sliding hoxes on the cross-slides is such that as the engine begins to reach the highest or lowest point of its stroke it is forcing the sliding box of the air piston cross-slide transversely to one side of its slotted crosshead, and this hox becomes nearly stationary at the time when the engine crank is passing its dead point, so that the absolute work of the engine is at a minimum while the crank is passing the dead point. After passing that point the power of the engine crank increases until it reaches a position at right angles with the line of travel of the piston, and is exerted as a direct thrust upon the sliding hox, through its connecting arm.

By the peculiar formation of the cranks and bringing the two cylinders nearly in line, two complete cranks do not have to be formed, but the central arm which unites the two crank pins, serves to transmit the power of the engine to the piston of the air compressor. This arm revolves bodily around the axis of the shaft, as both its ends are connected with the crank

By having the double piston rods, whether the valves are in the cylinder head or in the piston, said valves may be of large diameter, as they may come between the piston rods. With a large area for the valves their action is rapid and free. With the piston rod in the center, not half the area can be utilized for valves and seats; but with double rods, over half the area may be utilized.

An air compressor to run two three-inch rock drills is about 4x4 by 7 ft. high, and

IMPORTANT PATENT OFFICE DECISION.—The Commissioner of Patents has rendered an important decision in the matter of interference of John B. Braun & Co., of Baltimore, vs. William T. Blackwell, of Durham, N. C. Braun & Co. applied for registration of the picture of a Durham hull as a trade mark for smoking tobacco, and were granted an interference with Blackwell, who had registered the same trade-mark. Blackwell filed his motion to quash the proceedings on these grounds: That the Patent Office has no jurisdiction to entertain an application for the registration of a trade-mark, the Supreme Court having pronounced the trade-mark law unconstitutional; that it has no power to declare an interference in the matter of such application, and that it has no jurisdiction to adjudge the questions arising under such an interference so declared. The

There are a good many places in this State which will yet yield thousands of dollars, but which to-day are considered played out. There are many spots which will by and by be worked over carefully which will yield good wages to working miners. We all know very well that some ground has been worked over a dozen or more times and yielded something to each set of miners. This is placer ground of course. But some quartz claims which have been abandoned have been started up by new men under better auspices and made to pay very well. Claims which will not pay companies with presidents, secretaries and superintendents all drawing heavy salaries, may pay three or four working miners when they take hold of it. Ledges worked at loss 15 or 20 years ago, can be worked at a profit to-day.

And it is not by any means always necessary to have incorporated companies to carry on a mining operation successfully; any more than it is necessary to have a mill for every little ledge that is opened. A few working miners, with industry and energy, can accomplish wonders. With free gold rock as we have in so many places in our State, and the old-fashioned adastra, a great deal may be accomplished. At least the miner, with any luck, can make a living, and be independent, if he does not get rich. These remarks may be thought to be general in their nature, and to have no particular application. A case in point may be cited to show how correct they are.

Angels Camp, in Calaveras county, used in early days to be a flourishing mining center, as most any old Californian will remember. There were several large quartz mills, a flourishing town and a prosperous community. By and by the place "petered out," as the saying is, and the machinery was removed to other localities, the ledges were abandoned and the place became a very quist little town.

Within the past three or four years, under the new order of things as regards economy of living, scarcity of employment and decrease of wages, a good many prospectors have come along that way and hunted up claims. Many new ledges have been found and old ones reopened. Now there are 300 or 400 men in the neighborhood, and Angels is quite a lively little place. Most of the ore is "fres gold" and can be worked in an arrastra.

And here lies one of the secrets. This "poor man's mill" has been of great advantage to the locality. The men had no hopes of mills being built, as what were there had been taken away. In consequence they built arastras, and there are now 50 or 60 of these around Angels and that part of the country, all paying well. These are generally run in pairs, and by water power. The water does not cost more than \$3 or \$4 per day. It does not cost much to get out ore and work it in the arastras. It is all free gold rock nearly. Some of the sulphureted rock is sold to the mill at Murphys, where the generality of it sells for \$40 per ton. These miners have gone to work and taken the hull by the horns. They haven't waited for capital, though they would like some of it to come their way. They are all a pretty prosperous looking set we are told. And no doubt other places in this State, treated in the same way, would produce like results.

CAUSE OF THE IMPERIAL FIRE.—The superintendent of the Con. Imperial expresses the opinion that the recent fire was due to the carelessness of the engineer, whose duty it was to hoist and lower men through the winze. He says: "In my opinion the fire must have ignited from a candle used by the engineer, whose duty it was to run the engine to hoist and lower men through said winze, or possibly it may have been from hot embers or sparks falling from the pipe of the engineer. It started in a cooling house where the engineer was accustomed to stay when not required at the engine. Of course we cannot say to a certainty just how it did originate, but we are satisfied that it was carelessness on the part of the engineer, and not arson on his part."

weighs about 2,500 lbs. The compressed air is stored in the frame and hose, as previously stated, the frame being the air receiver. The compressor is strongly and well made, and after having been tested about a year, has been introduced into several mines on this coast.

THE Board of Naval Engineers, consisting of Chief Engineers Loring, Ayres and Magee, who were ordered to make experiments with the small steamer, *Anthracite*, which recently crossed the Atlantic, to decide as to her economic qualities, have made a report to the Secretary of the Navy of the most favorable nature. They say her special qualities as to speed and the expense of operating are admirable and deserving of special notice.

THE Secretary of the Interior on Monday decided the appealed case of the Seaton mining company *vs.* John A. Davis, appellant, for patent to the Peerless quartz mine in the Sacramento, California, land district. The Secretary directs that the application of Davis be permitted to take the usual course as in the case of an original claim.

motion was argued on behalf of Blackwell by Mr. Fuller, of North Carolina, and Phillips, Maury & Phillips, of Washington D. C., and opposed on behalf of Braun & Co. by A. H. Evans & Co. The Commissioner decided that he had jurisdiction, and ordered the interference to proceed.

ANOTHER MINE SOLD.—Concerning the Napa Con. Quicksilver mine, the Boston *Economist* of November 20th says: A meeting of the subscribers to the syndicate for the purchase of the above quicksilver property was held on the 17th inst., at the office of Messrs. Humhart & Co., 95 Milk street. The sale of the property was closed to the syndicate, and the following well-known Boston gentlemen were nominated and unanimously elected to act as Directors of the company for the ensuing year: Frederick O. Prince, Henry Hastings, Dudley Hall, Frank B. Cotton and Orrin Murray. Edward Hastings was elected Secretary.

THE Grand Victory mine at Squaw hollow, El Dorado county, has just started up its new 50-stamp mill, which is run by a turbine wheel.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—*Ens*

El Dorado County Mines.

EDITORS PRESS:—The Kimball mine is situated in the Gold Hill mining district, about five and a half miles from Placerville, and has become somewhat noted of late in local circles. The mines of this locality are mostly of the "pocket" character, and many rich strikes have been made in various locations. In some respects the Kimball mine is of the same character, and the pockets have been very plethoric, reports giving it credit for several that have yielded from \$2,000 to \$5,000 each; but in addition to these pockets the whole ledge matters prospects well in gold, and will pay, Mr. Kimball avers, from \$15 to \$30 per ton. The ore is very peculiar, resembling granite more than it does quartz, but fine quartz stringers are woven all through it. The mine is now being operated by Kimball & Anahle, who have it in first-class shape. The shaft is now down about 110 ft. upon the ledge, and drifts are being run with flattering results. The hoisting works, propelled by steam power, run like clock work, and the building is commodious and most convenient for the purpose. A 10-stamp mill is in course of construction some 200 yards below the mine, in a splendid location, which will be run by water supplied by the El Dorado Water and Deep Gravel Mining Co., which company supplies that whole section of country with water for mining and irrigating purposes.

A tramway will be erected from the mine to the mill, and in fact everything will be done upon the most approved scale. A large amount of ore is now upon the dump awaiting the completion of the mill, and it is rapidly accumulating. While there Mr. Kimball showed me some samples of rich ore taken from the mine, which, considering quantity, was the richest I ever saw; and the peculiarity of the quartz renders the inspection of it peculiarly interesting.

MINER.

The Ferguson Mine.

EDITORS PRESS:—The Ferguson gold mine, in Mariposa county, is opening out most satisfactorily, and the recent developments are confirming the character it has already earned for permanence and profitable ore. Immediately after the new hoisting and other machinery was got into operation, the sinking of the Ferguson shaft was resumed, and it has now reached a depth of 50 ft. below the 200 ft. level. It goes down right in the heart of the "Ferguson" ore body. The vein is from 2½ to 5 ft. wide, carrying gold, and galena, and other sulphurets all through the quartz. The gold is found in larger particles as the sinking proceeds, and the character of the quartz is exactly similar to that above the 200 ft. level, which yielded the owners a clean profit of \$30,000 from six months' working with the old mill of eight stamps, recently replaced by two more powerful batteries of ten stamps. The 100 ft. of sinking will be completed by December 31st, when the 300 ft. levels will be started, and this prolific ore body opened out for systematic stoping. The prospects of the mine were never brighter than they are to-day.

L.

Pacific Coast Indians.

The annual report of the Indian Bureau contains some features of distinctive interest on the Pacific coast. Acting Commissioner Marble says: The condition of the Mission Indians of California has become yearly more deplorable. They are estimated to number about 3,000, and their settlements are scattered over portions of San Bernardino and San Diego counties, and chiefly in the mountain and desert districts, embraced in a range hundreds of miles in extent. In the last annual report of this office these Indians were made a subject of special mention. Attention was drawn to the fact that many of them were occupying lands by suzerainty which their ancestors had cultivated from time immemorial, and had held by an undisputed right, but that such lands had been found to be within the limits of private land claims, confirmed by the Courts to grantees under the Mexican Government before the acquisition of California by the United States, and that the owners thereof were threatening the Indians with summary ejectment. Legislation to provide them with suitable and permanent homes was urgently recommended, but no action was taken by Congress. Agent Lawson's report for the current year states that their ejection from the ranchos San Jacinto and San Jose del Butte is liable to occur at any time, and there being no unoccupied lands except such as are uninhabitable, the only alternative left these hitherto peaceful and thrifty communities is to wander about singly or by families, and swell the vagabond class that already infests the villages and towns, to become a prey to the vices to which as yet they are comparative strangers. He also reports that about 15 families were some time ago forced to remove from the Cucca ranch, in San Diego county, under similar circumstances. The Acting Commissioner continues: The Mission Indians, as a class, are reported to be in-

dustrious, maintaining themselves by cultivating their little fields or in laboring for ranchmen in the vicinity of their villages. During the sheep-shearing season they are greatly in demand, being well skilled in this kind of labor. In the season of 1879 the supply of water for irrigating purposes on the desert, some 50 to 80 miles distant from the agency, where hundreds of these Indians live, entirely failed, and they were compelled to depend for subsistence upon a wild bean which grows in the desert, never having received any aid from the Government, and being accustomed to the miserable destitution enforced by their helplessness, they endured hunger and thirst without seeking or expecting help. Then, for the first time in their history, their agent, hearing of their condition, applied for assistance, to which the department promptly responded by ordering the sum of \$500 to be expended in supplies to relieve their wants. In the interest of common humanity, something should be done for this uncomplaining people, toward providing them with a home. They do not ask for supplies; all they ask for is a reservation on which they can earn a subsistence for themselves and families. Their educational and religious interests have also been unprovided for. Recently the Department has authorized the buying of two school-houses in two of the larger settlements. But little, however, can be effected in this direction until the tribe is consolidated and brought under the controlling influence of the agent, and to this end I earnestly recommend the passage of appropriate legislation in their behalf. The report says, with reference to Chief Winnemucca's tribe, now in Nevada, that it is not considered desirable to compel them to remove to the Malheur reservation, and most of the other Indians formerly collected there have been removed to Yakima. It is recommended that all of the lands included in the Malheur reservation be appraised and sold, and the proceeds invested for the benefit of the Indians. These lands comprise nearly 1,800,000 acres. The condition of affairs at the Yakima agency, where 3,000 Indians are collected, is reported to be highly gratifying. They are extensively engaged in agriculture and stock raising; cultivate 8,000 acres of land, and last year raised 35,000 bushels of wheat, besides various other products, including 1,000 tons of hay; 3,300 of them now wear a civilized dress. They have built a handsome church and a number of first-class farm houses, and less than 1% of their wants is now supplied by the Government. Their complete civilization, under the excellent management of their old agent and friend, Wilbur, is believed to be near at hand. Attention is called to the fact that treaty provisions providing for the support and civilization of the following tribes expired last June, viz: The Walla Walla, Cayuse and Umatilla tribes in Oregon, and the D'wamish, Makales, Quinalts, Skollams and Yakamas in Washington Territory. The report says: The present condition of these Indians renders it very important that the aid and assistance heretofore extended be continued, and that early steps be taken for their permanent settlement upon lands in severalty, and for the sale of so much of their respective reservations as may not be required by them.

Progress Toward Civilization.

Many of these tribes have made commendable progress in civilized pursuits in the last few years, and there is an uneasy feeling and great anxiety on the part of many of their leading chiefs to know what the policy of the Government will be toward them. The persevering progress made by the San Carlos and Arizona Apaches toward civilization is described with much satisfaction, and it is predicted that unless some obstacles, such as a diversion of their supply of water for irrigation, be placed in the way, the so-called "intractable Apache" will, in a few years, be taught to raise the greater part of his subsistence. The Industrial School established at Forest Grove, Oregon, for the benefit of the Indians on the Pacific coast, is reported to be doing good work, under the management of Lieut. Wilkinson, U. S. Army, and a liberal appropriation for its enlargement is earnestly recommended. The attention of Congress is again called to the necessity of making some provision for the education of the Alaska Indians, and it is suggested that an appropriation of a few thousand dollars for that object would enable the Bureau to educate some Alaska youths at Forest Grove, who, after a few years' training, would be fitted to become teachers among their own people.

THE CONCENTRATOR.—The copper concentrator of Boardman & Stephens has got down to active work. The building, located some distance south of the copper smelter, is fitted up with a part of the machinery formerly used in the National mine, and with a rock breaker, screens, and all other needed appurtenances. The works are at present making a run on ore from the Parrot mine, where there is a dump of 2,500 tons for the treatment of which Boardman & Stephens have the contract. The process employed is simple and comparatively cheap, and is a success as far as the concentration is concerned. The ore, as taken from the mine, contains from 12% to 15% of copper, but on being run through the separator is found to assay from 26% to 46% of that metal—a sufficient amount to pay a profit after being sent East for reduction. The capacity of the works is about 25 tons per day, and enough of low grade ore is already promised the new company to keep them engaged during the coming winter. Ten men are employed.—*Butte (Montana) Miner.*

To Lease or Not to Lease.

There is a wide difference of opinion among miners and mine owners in regard to the propriety of working mines under lease or day's pay. In the case of a strong company possessed of sufficient working capital, day's pay men, or what is still better, contractors, are undoubtedly preferable to lessees. If the company is in such a situation, however, that the employment of lessees or a cessation of work is inevitable, the former course is certainly to be preferred. This closing down of a mine for a year or two while a capital is being raised for its development entails an unnecessary loss to its owners. The underground workings suffer damage from water and other causes which a daily inspection of the property would prevent, and the detriment to hoisting machinery or other surface improvements is equally as great.

The great difficulty in leasing lies in the fulfillment of the terms of the lease where it is adverse to the interests of the lessees. In such cases proper timbering and development work requires the most careful supervision to insure its performance, and the unfortunate lessees are usually more to be pitied than blamed; while, on the other hand, their greatest success secures nothing to the owners but the exact stipulations of the lease. Men working for day's pay are not impelled by the stimulus of hope that inspires lessees, and where inefficient foremanship permits it, there is sometimes a successful attempt to do the smallest amount of work in the largest amount of time. This state of affairs is obviated by the employment of contractors where the nature of the work admits of contract labor—such, for instance, as stoping, sinking and running levels. The loss of mineral on the stulls is doubtless greater with contractors than with men employed at so much per day, but only in case of the exploitation of ore of extraordinary richness, would this counterbalance the economy of time; and where the still dirt is crushed and concentrated, as is the case at the Dunderberg, for instance, it is of still less importance. At the best, however, nearly one-half of the labor expended on a mine must be done by day's pay men unless the property is leased, but much of this work necessarily insures a given amount of labor in a given time.

Although it is undoubtedly wrong in principle, it is claimed by at least one mine superintendent in this district that leasing is the most economical plan of working a mine. If this be so, either the lessees do not average the wages paid to miners, or day's pay men do not earn their wages. Mining is a vocation liable to wide variation in its results, and companies should at all times have absolute daily control over their properties so as to be enabled to receive every advantage that may accrue to them. Leasing does not permit this.—*Colorado Miner.*

October Bullion Product

The output of bullion throughout California, Nevada, Idaho, Utah, Arizona and Dakota for October was probably as large as for the months immediately preceding. There has been more delay, however, in getting in the returns at this office. From many producing mines in the above States and Territories no reports have ever been received, the managers declining to make public, even without cost to themselves, the amount of bullion produced from month to month. Some of the other mines, from which we had a right to expect reports, have either declined or neglected to respond for the month of October. The three Dakota mines in the annexed list are all estimated. The reports from the other gold mines for October are official, as follows:

GOLD MINES.	
Bodie Con.....	\$ 50,500
Blue Tent gravel.....	25,000
Deadwood (Dakota).....	35,000
Gold Hill quartz.....	7,000
Golden Trench (Dakota).....	35,000
Homestake (Dakota).....	140,000
Idaho (Nevada county).....	40,000
Milton Gravel.....	65,000
North Bloomfield.....	46,800
Noonday.....	25,600
North Noonday.....	20,000
Oneida.....	12,400
Standard Con—\$11,200 silver.....	161,300

Total thirteen gold mines.....\$604,400

The report of the Blue Tent gravel of Nevada county, California, is the first made. The total is the result of the first clean-up from a run of 13 days. Several California gold claims are necessarily omitted for causes already stated. The October reports of the silver mines, so far as we have been able to gather them, are as follows:

SILVER MINES.	
Argenta.....	\$ 2,100
Christy (Utah).....	26,400
Harshaw (Arizona).....	80,000
Independence.....	7,700
Indian Queen.....	17,200
Manhattan.....	148,400
Mt. Diablo.....	85,100
Northern Belle.....	82,400
Ontario (Utah).....	225,100
Richmond Con.....	129,000
Silver King (Arizona).....	50,000
Star.....	28,800
Tip Top (Arizona).....	30,000

Total thirteen silver mines.....\$901,200

The Harshaw, Richmond Con. and Silver King are estimated. There is quite a number of other silver mines that ought to be in the above list, and it is no fault of ours that they are omitted. Only two of the Comstock mines

produced any bullion of consequence in October. Following is the October statement of four mixed metal mines:

GOLD AND SILVER MINES.			
	Gold.	Silver.	Total.
California.....	\$ 57,900	\$ 27,500	\$ 85,400
Con Virginia.....	52,500	10,000	71,500
Eureka Con.....	44,100	104,600	138,700
Western.....	24,800	106,100	129,900
Totals.....	\$170,300	\$246,200	\$425,500

*Including a value of \$23,400 for lead.

The California and Con. Virginia did not do as well as in September, while the Eureka Con. and Western did better. The descriptions of bullion in the above statement compare as follows with the report for the same month last year:

	1879.	1880.
Gold.....	\$ 649,100	\$ 832,500
Silver.....	917,000	1,130,200
Lead.....	57,900	23,400
Totals.....	\$1,624,000	\$1,991,100

In October, 1879, we had reports from 10 gold mines, 19 silver mines and four gold and silver mines. For the same month in 1878, 36 mines produced \$2,250,000.

Extending these statistics so as to cover the 10 months of the year, we have the following record:

	No.	1879.	No.	1880.
January.....	35	\$1,900,900	29	\$1,532,200
February.....	32	1,811,900	28	1,367,900
March.....	35	2,564,300	23	1,487,400
April.....	30	2,437,300	25	1,240,400
May.....	36	1,884,300	20	1,385,500
June.....	36	1,780,500	30	1,767,800
July.....	50	2,103,000	38	1,631,000
August.....	33	1,714,500	32	1,775,000
September.....	33	1,833,400	32	1,892,100
October.....	33	1,624,000	30	1,091,100
Totals.....		\$19,810,300		\$16,151,700

The description of treasures embraced in the foregoing totals compare as follows:

Gold.....	\$ 8,311,400	\$ 7,005,200
Silver.....	10,908,400	8,860,800
Lead.....	590,500	235,700
Totals.....	\$19,810,300	\$16,151,700

During the corresponding period in 1878, an average of 34 mines reported an aggregate of \$33,816,100. The total for 1879 is from an average of 36 mines, while the report for the current year is from an average of 29 mines. Apparently, the product this year is only 50% of the total for 1878, but some account must be taken of the lessened number of mines reporting. We do not believe that the grand total of all the mines shows such a ratio of decrease.—*Bulletin.*

TWO GREAT MINES.—At their recent half-yearly meeting of the stockholders of the Sierra Buttes mining company in London, the secretary made a report of the financial affairs of the company, to the effect that the net profits of the half-year ending June 30, 1880, amounted to \$32,595, and that there was a balance from the previous accounts of \$48,335, making total available \$80,930, and about \$1,980 that had been applied to production of property and water rights. A dividend of one dollar a share was then declared, aggregating \$30,625. The September product was \$28,220, working expenses, \$17,831, outlay for shipments, \$974. At the last meeting of the stockholders of the Plumas-Eureka mining company, (whose affairs are under the same management as those of the Sierra Buttes) in London, the secretary made a report of the affairs of the company to the effect that there were in the treasury, \$173,385, of which \$6,490, were to be paid for a debt on Mohawk mill, leaving a balance of \$167,895. A dividend was then declared of three shillings per share, aggregating \$105,438 leaving \$62,430 in treasury. Thirty-three thousand six hundred and thirty-six tons of ore were handled during the half-year, at an average cost of \$2.65½ per ton; milling cost being 70½ cents per ton.

BONDHOLDERS.—A special agent of the Census Office has completed an investigation of the ownership and distribution of 4% and 4½% registered bonds: Total 4½% registered, \$528,100,950; individuals, \$271,435,900; National Banks, \$136,526,700; Banks and Trust Companies, \$113,306,900; foreign holders, \$6,831,450. Total 4½% registered bonds, \$170,280,800; individuals, \$72,010,900; Banks and Trust Companies, \$59,620,400; National Banks, \$39,461,950; foreign holders, \$5,187,550. The Eastern States own 17.9-10% of the bonds; the Middle States, 64.7-10%; the Western States, 14.2-10%; the Southern States, 3.5-10%. In the Eastern States, 70% of the bonds are owned by males and 30% by females; in the Middle States, 81 by males; in the Western States, 81 by males; in the Southern States, 78 by males.

TIoga DISTRICT.—E. B. Burdick, a well-known mining man, is in from Tioga district, with exceedingly rich rock taken from a shaft sunk 60 ft. in a compact vein. The ore is on exhibition at the Occidental parlors, and is a cross between the richest ore of the Manhattan, at Austin, and the Con. Virginia, on the Comstock. Tioga district is near (in fact on) the summit of the Sierra Nevada mountains, at the head of Bloody canyon, and in view of the importance of recent discoveries in the new district, W. J. Walker, who has large interests both in Tioga and Homer districts, intends building a toll road up Bloody canyon from King's ranch to the summit early next spring. Several Bodie parties will leave this evening for Tioga.—*Standard News.*

MECHANICAL PROGRESS.

Rules for the Management of Steam Boilers.

Engineers and users of steam power will be benefited by keeping constantly in mind the following rules:

1. Condition of the Water.—The first duty of an engineer, when he enters his boiler-room in the morning, is to ascertain how many gauges of water there are in his boilers. Never un-bank nor replenish the fire until this is done. Accidents have occurred, and many boilers have been entirely ruined from neglect of this precaution.

2. Low Water.—In case of low water, immediately cover the fire with ashes: or, if no ashes are at hand, use fresh coal. Do not turn on the feed under any circumstances, nor tamper with, nor open the safety valve. Let the steam outlets remain as they are.

3. In Case of Foaming.—Close the throttle, and keep closed long enough to show the true level of water. If that level is sufficiently high, feeding and blowing will usually suffice to correct the evil. In case of violent foamings, caused by dirty water, or change from salt to fresh, or vice versa, in addition to the action above stated, check draft and cover fire with fresh coal.

4. Leaks.—When leaks are discovered, they should be repaired as soon as possible.

5. Blowing Off.—Blow down, under a pressure not exceeding 20 lbs., at least once in two weeks; every Saturday night would be better. In case the feed becomes muddy, blow out six or eight inches every day. Where surface blow cocks are used, they should be often opened for a few moments at a time.

6. Filling up the Boiler.—After blowing down, allow the boiler to become cool before filling up again. Cold water pumped into hot boilers is very injurious, from sudden contraction.

7. Exterior of Boiler.—Care should be taken that no water comes in contact with the exterior of the boiler, either from leaky joints or other causes.

8. Removing Deposit and Sediment.—In tubular boilers the hand-boles should be often opened, and all collections removed from over the fire. Also, when boilers are fed in front and blown off through the same pipe, the collection of mud or sediment in the rear end should be often removed.

9. Safety Valves.—Raise the safety valves cautiously and frequently, as they are liable to become fast in their seats and useless for the purpose intended.

10. Safety Valve and Pressure Gauge.—Should the gauge at any time indicate the limit of pressure, see that the safety valves are blowing off.

11. Gauge Cocks, Glass Gauges.—Keep gauge cocks clear and in constant use. Glass gauges should not be relied on altogether.

12. Blisters.—When a blister appears, there must be no delay in having it carefully examined and trimmed or patched, as the case may require.

13. Clean Sheets.—Particular care should be taken to keep sheets and parts of boilers exposed to the fire perfectly clean; also, all tubes, flues and connections well swept. This is particularly necessary where wood or soft coal is used as fuel.

14. General Care of Boilers and Connections.—Under all circumstances, keep the gauge cocks, etc., clean and in good order, and things generally in and about the engine and boiler-room in a neat condition.—*Ex.*

STEEL SHIPS.—Experiments now being made indicate that the model ship of the future will be built of steel. It is found that this material gives greater strength and buoyancy in proportion to weight than iron. It is said that a steel ship can carry one-fifth more weight than an iron ship of the same dimensions, providing the freight is of a character to admit the difference in loading. It is urged against steel ships that salt water will work on the material with more corroding effect than upon iron. But this is not yet established as a fact. So far as the United States is concerned, the present is a good time to commence anew in ship-building. We have very little to condemn as worthless. We have no national navy worthy of the name, and our mercantile navy is fast disappearing from the seas. We can encourage new processes in building, without giving much thought to the ships that these new processes will displace. It appears, however, that there is more activity among English builders to demonstrate which is the best material for ships than among Americans.

STEEL STEAMBOAT SHAFTS.—Preparations are being made at the Black Diamond Steel Works of Park Bros. & Co., at Pittsburgh, Pa., to cast the first steel shaft for steamboats ever manufactured in America. Heretofore such shafts could only be made at Krupp's famous works in Germany, and it was only last week that a Pittsburgh towboat, the Joseph B. Williams, was supplied with one of these shafts, transported especially for it from Germany, and placed in the boat at Cincinnati. Since the immense steam hammers have been cast at the Black Diamond Steel Works, Pittsburgh will also be able to cast these large shafts, saving to steamboatmen the cost of transportation from Germany. Pittsburgh is the only place in the United States where

The Expansion of Steam.

Prof. R. H. Thurston writes to the *Scientific American* as follows in answer to the question: "What is, really, the proper point of cut-off in steam engines to give maximum economy in dollars and cents?" "Some people say one thing and some another. In your 'History of the Steam Engine,' page 473, you say about one-half the square root of the steam pressure is about right, 'in general,' and a writer in the *Journal of the Franklin Institute*, for June, who ought to understand the matter, says that the steam pressure divided by the back pressure gives the number of times to expand to secure maximum efficiency.

"Now, your rule would give, for a Corliss engine with 90 lbs. of steam, a cut-off at one-fifth, while the last would make it one-seventh. Then again, for an old-fashioned engine with condenser, cutting off steam at 25 lbs., your rule makes it about one-third, and the other says one-fiftieth or even one-twentieth, which I know by experience cannot be right." The Professor answers as follows:

The point of cut-off giving maximum economy in steam engines is never precisely the same in any two engines. It will vary with every change of type, with every change of pressure of steam, with every difference in piston speed, and even in two engines built from the same drawings and made from the same patterns, the degree of expansion being the same, the two machines will demand different quantities of steam.

Could all the conditions affecting the expenditure of heat in the production of power be made absolutely invariable, the point of cut-off for maximum efficiency could be determined for those conditions—not by calculation, but by experiment; and it would remain the same just as long as those conditions could be maintained absolutely the same. But this never occurs in practice.

Steam enters the cylinder sometimes barely dry, sometimes superheated, sometimes damp with a watery vapor, and often mingled with water to the extent of 10% or 20%; it even sometimes carries with it more than its own weight of water. It sometimes comes in contact with hot and nearly dry metallic surfaces, which aid in keeping it in a state of maximum efficiency; but it often, in fact usually, meets an interior filled with damp chilling vapors and surrounded by walls cool enough to condense a considerable part of the steam supplied up to the point of cut-off. During expansion the steam never follows precisely the law of expanding permanent gases—with which the pressure diminishes precisely in the proportion in which volume increases—but, by condensation at first and by re-evaporation later in the stroke, the expansion line falls below at first and then rises above the curve expressing Mariotte's and Boyle's law, although frequently approaching that curve pretty closely. If the engine speed increases the steam is usually less affected by causes producing loss; if the speed decreases a loss of economy generally ensues. Large engines are less subject to such losses than small ones, and every reduction in the amount of engine friction permits a closer approximation to theoretical conditions.

It is easy to determine the proper point of cut-off for any defined set of conditions provided they are such as can be mathematically expressed, and the larger the engine, the hotter the steam used, the higher the piston speed, the less the friction, and the more perfect the system of lagging and steam jacketing, the more nearly will the actual correspond with the estimated value; but the theoretical rate of expansion is rarely very nearly attained in our very best practice, and experience shows that we must usually content ourselves with a vastly smaller degree of economy by expansion than would be mathematically predicted.

Instead of cutting off at one-twentieth when using steam at 45 lbs. pressure in a single cylinder condensing engine, we find that a cut-off of at most one-fourth gives, in practice with ordinarily good engines of moderate size, the best results.

In handling non-condensing engines of 200 or 300 horse power, with steam at 60 to 90 lbs., and a speed of piston of about 500 ft. per minute, and using the standard forms of "drop cut-off" familiar to American engineers, we can barely gain by expanding more than five times.

No theoretical determination of the proper point of cut-off has ever been made that is of any service to the engineer. No device yet invented has ever given even a rough approximation to the efficiency indicated on purely theoretical grounds.

We are gradually learning more and more about the behavior of steam in the engine, and are in our every-day practice, as illustrated by the best builders, keeping very close to what is, all things considered, the line of true economy. All these matters must be finally settled by experience.

A CURIOUS HORSE SHOE.—A German manufacturer has invented a horse shoe composed of iron and hemp, which is said to be meeting with considerable favor. The shoe is of malleable iron, having a deep, wide groove, into which tarred hemp rope is firmly wedged. The rope protrudes beyond the rim of the iron, and the whole is said to form a light and serviceable shoe. We wish some German friend would favor us with a sketch from which to make an

SCIENTIFIC PROGRESS.

The Work Now Before Astronomers.

Prof. Asaph Hall, in an address before the astronomical section of the American Association for the Advancement of Science, which lately held its annual session in Boston, gave an admirable outline of the present status and future prospects of the work before astronomers, which we briefly summarize as follows: An accurate knowledge of the proper motions of the fixed stars, and of the great changes of light and heat among them, can only be attained by long continued and laborious observations made through centuries yet to come. Hence, the observations of to-day should be carefully divided up and made so accurately that the astronomers of the future may rely with confidence upon the results of the labors of their predecessors to detect and measure changes which take place only during the lapse of ages. Similarly prolonged observations are also needed for the full development of the secular changes in our own solar system. With the exception of Neptune, the orbits of the planets are already quite well determined; but in many other respects much is yet to be learned. In the case of Saturn, all the tables are in error; but these errors are supposed to arise from some defect in the theory of that planet. The lunar theory is still an unsolved mystery, and all the lunar ephemerides are effected with empirical terms. The observations of the fixed stars are of the highest importance, since they are the fundamental points on which our knowledge of planetary motions and even the motions of the stars themselves depend. Previous to the present century, but little work had been done on double stars. In this field, although the work is simple, the observations should be made with great care and accuracy. The astronomer, above all other scientists, should have patience in his work, and be content to allow future generations to reap the reward of his toil. The physical theories of the universe, of which modern popular science is so productive, are generally worse than useless, notwithstanding he who rants freely about the nebular hypothesis is often considered one of advanced astronomers of the day. A good observation of the smallest double star, or of the faintest comet or asteroid, is worth more than all such vague talk. It is only about 40 years since a stellar parallax was first measured, and then the most powerful instruments were employed. Much remains to be done in this direction. Photography, which has rendered good service in descriptive astronomy, does not admit of the accuracy of measurement required for stellar work. The determinations of the motion of stars toward or away from the sun are so discordant that no confidence can be placed in the results so far obtained. It is hoped that some of the large instruments now in course of construction, may throw more light upon this obscure subject. Argelander and his assistants completed their great catalogue of 324,198 stars in 1861. It is a work of great value and should be extended to other parts of the heavens. By taking account of a large number of stars, it may be possible to determine the motion of the solar system in space. Very few American observatories have been established for the purpose of doing purely scientific work, for they are generally built in connection with some college, and are the product of some local enthusiasm, which builds and equips an observatory and then leaves it helpless for support. The Professor remarked, in closing, that the present and prospective means for placing instruments at elevations of 8,000, and even 10,000 ft., will doubtless result in much good. At such altitudes, we may be able to do, with small apparatus, work, that under ordinary conditions requires much more powerful instruments.—*Californian for December.*

NEW USES FOR ROCK CRYSTAL.—A German maker of philosophical apparatus, Herr Siegfried Stein, of Bonn, has of late strongly urged the claims of rock crystal as a material pre-eminently adapted for the production of normal weights and measures and other instruments of precision. He has made sets of weights, balance beams and scale pans of balances, and portions of engineering instruments from rock crystal, and his innovation has received many favorable comments from professional men. The advantages of rock crystal over metals for such instruments of precision consist in its complete indifference at common temperatures to the action of acids or alkalies, and to the gases and moisture present in the atmosphere, which to a greater or lesser degree must in time affect the last named. For the production of standard weights especially, Herr Stein's suggestion has been received with great favor, his rock crystal weights having obtained the unqualified praise of such eminent analysts as Fresenius and others. For this particular use, it may be added, its superior hardness to the metals usually employed is another decided advantage. Herr Stein urged, on similar grounds, the advantages of rock crystal in the production of standards of measure, whether longitudinal or circular, and in the construction of parts of a

Spectroscopic Study of the Sun.

The intensity and the frequency of reversal of the magnesium rays, in the green region of the solar spectrum, has long attracted the attention of spectroscopists. It has also been observed that the reversal did not affect all the rays at the same time. Prof. Young has made extensive comparisons with the G ray of hydrogen, which is always reversed in the chromosphere; Lockyer has shown that the reversed rays are the longest, and that among the reversed rays that which is the least intense is also the shortest; Tacchini measures the variations of solar activity by the number and frequency of reversals, supposing that the most intense rays appear first and that the energy of the eruptions varies in proportion to the number of reversals. This inequality of reversal has led to the theory that all terrestrial elements are dissociated in the sun into other unknown elements which have more simple spectra than those which are known. This theory implies the impossibility of deducing the constitution of celestial bodies from the spectral study of terrestrial elements until they have been dissociated and their component elements have been recognized.

Fizeau has studied the spectra in various ways. He first examined the influence which the relative intensity of the brilliant magnesium rays exercised on their visibility by projecting them upon the solar spectrum and thus effecting a true reversal. He then repeated his experiments upon the simplification of spectra by varying the intensity of the spark. Finally, guided by Lord Rayleigh's investigations in spectral optics, he studied the influence of a dispersion and of a definition, more or less considerable, upon the number and visibility of the rays, by comparing prismatic and diffraction spectra. His experimental arrangements were the same as those which he adopted in his investigations upon the spectra of hydrogen and nitrogen. They seem to establish conclusively his opinion that a modification in the appearance of the spectrum springs from a physical cause and not from a change in the chemical constitution of the metal or a dissociation, and that the unequal reversal of the magnesium rays is caused by a difference in the intensity of the brilliant rays and not by any special state of the metal.—*Bull. de l'Acad. de Belg.*

Punching Iron.

Tresca's experiments upon the flow of solids, and the experiments upon cold punching by Messrs. Hoopes and Townsend and Prof. Thurston, have induced Prof. Keller to make a series of experiments in the machine shops of Karlsruhe. The pieces, after being punched, were cut and the surfaces treated with a solution of chloride of platinum in water, containing one part of the chloride for 250 to 300 parts of water in volume. The employment of this solution brings out the lines of flow in brown upon a ground of brilliant gray. The operation of punching is divided into two distinct periods. The first begins with a depression at the top, the displaced matter being carried toward the bottom in such a manner that the sides, which are at first vertical and parallel, soon incline toward each other. In proportion as the punch advances the material turns toward the point of least resistance forming a sort of button underneath, the height of which is always much less than the depth to which the punch has penetrated, showing that the metal has either been compressed or that it has been driven laterally into the body of the piece. Keller found by experiment that the specific gravity of the plug was a little less than that of the residue. This fact had been observed by Hoopes and Townsend, but they attributed it to errors of observation. If the plug is cut into sections the density is found to increase toward the top, showing that there is a flow from underneath the punch laterally into the mass of the iron. In the second period, or period of chiseling, the resistance is less; there is no more compression and the plug goes out in proportion to the descent of the punch until the separation is complete.

THE OLDEST SCIENTIFIC SOCIETY.—The Academy of the Lyncei, according to M. De Laveleye, is the oldest scientific society in existence. It was founded at the beginning of the seventeenth century by four young men, who took as their symbol the lynx—an animal then to be found in the Apennines—with the motto, *Sagacius ista*. The members "were to penetrate into the interior of things in order to know the causes and operations of nature, as it is said the lynx does, which sees not only what is outside, but what is hidden within." Their dream was nothing less than the organization of modern science based on the method of observation—the *clerk* of knowledge. The academy was to have in the four quarters of the globe, dwellings with sufficient endowments to maintain the members, who might live there in common. These dwellings were to be provided with libraries, laboratories, museums, printing presses and botanical gardens—in a word, with everything necessary for study. Their observations were to be communicated by writing to all the members. The Lyncei were to renounce marriage as a *mollis* and *effeminata* requies, and injurious to study; nevertheless, monks were not admitted. The academy was reorganized in 1875, and has members of various nationalities. Among the English members are Gladstone, Freeman, Rawlinson and Herbert

LATEST DIVIDENDS-WITHIN THREE MONTHS</

It is about 4 ft wide. The percentage of silver in it is lighter than has been the case in other parts of the ledge, and the gold is much more abundant, and the sulphur of a higher grade. The chert has been explored a distance of about 40 ft since its discovery, and is said to constitute the richest development ever made in the mine.

LOWELL HILL MINER.—The tunnel of the "Morgan" claim, above the town of Lowell Hill, is in between 1,500 and 1,600 ft, from which road gravel is being taken out. The new bedrock tunnel of the Swamp Key has 400 ft yet to run before striking gravel. The old tunnel was too high. The Dewey company's tunnel, now in 1,700 ft, will reach gravel within the next 250 ft. Nothing further will be done toward running the Planet company's new tunnel till the Dewey tunnel is completed, and the proper level at which to start is determined.

THE BALDWIN CLAIM.—The Baldwin gravel mining company, which has been working the Baldwin claim, during the past summer has been engaged in running a tunnel from Bloody Run into the ridge which separates that ravine from the Derby mining company's ground on this side. The tunnel, on which work has just been suspended for the winter, is now in a distance of about 200 ft. The owners estimate that it will tap the rich gravel deposits for which they are prospecting at a distance of from 100 to 150 ft of the ridge to a mile. The tunnel is said to extend down the vicinity of Lake City, and comprises 700 acres in all.

CONTRACT LET.—The Directors of the Peard Con. mining company have let a contract to Thomas Peard to extend the lower tunnel in their claim a distance of 100 ft further. It is now in about 35 ft.

CELEBRATING THE DEBRISS. It will be remembered that several months since the Transcript contained an item regarding a cave that occurred in the San Francisco company's copper mine at Spenceville, in this county, whereby much damage was done. We are now informed that for some time past the mine had been worked on the "cutting" method—that is, every energy was put forth to make the output for the time being as great as possible, without any regard to the future. The workings were intensively timbered. A number of the stockholders were wise enough to get out of the enterprise just before the cave, which was apprehended by the more watchful of them, took place, and as the stock was then in some demand, they made a good thing out of their interests. A force of men are now engaged in clearing away the debris preparatory to resuming regular operation in the mine.

FORBES' MINING STATE. The Blue Banks hydraulic claim at Moore's Flat was sold during the past week to Morton Alger and others, of Boston, Mass. The amount reported to have been paid for the property is \$50,000, which is, by those who are posted in regard to its value, regarded as a very reasonable price. H. A. Brigham, one of the best hydraulic miners in the county, assumes the Superintendency of the mine under the new management. Everything will be put in first-class shape this winter, and our informant says that by next spring a force of men, numbering in the neighborhood of 100, will be employed. The former owners of the claim were Jas. Reid, Wm. Rankin, Wm. Pride and Elisha Mills, all of whom are bachelors. Messrs. Rankin, Reid and Mills have held their interests for a quarter of a century past. Mr. Pride buying in about 6 years ago. The property has yielded them a steady income, although, owing to the old and extent of their operations, a comparatively small portion of ground has been worked over. The claim can be worked by either the hydraulic or drift process. We are not informed as to which the new company will adopt, but it will probably be the former.

SCOTIA.—Free Lance, Nov. 25: In sinking at the Scotia mine a fine stringer has been struck in the shaft, which is very fine in mineral, and of right size. The stringers are about 12 inches thick, and are almost vertical, which causes the shaft, which is perpendicular, to follow it for a good distance. The stringer is yet in the bottom, at a depth of 130 ft. Several of our best judges and most experienced mining men have examined the rock from the Scotia shaft, and they all pronounce it to be first-class ore for this old and reliable district of Grass Valley.

GOLD BRICKS.—San Francisco Chronicle, Nov. 27: We had in our hands on Friday of last week a bundle of golden bricks taken from the Boston mine at Moore's Flat, which we were told were worth about \$21,000. Mr. McMurray, the Superintendent of the company (Eureka Lake), had possession of it, and was conveying it to the express office when we saw it. That Boston mine is one of the best in the county.

DEADWOOD MINER.—Nevada Transcript, Nov. 24: A small shafting of ore from the recently discovered pay chute of the Deadwood mine has been made, the clean-up being highly satisfactory. The managers of the property are confident that the future career of the property will be a prosperous one. From the time that they lost the ledge till they found it again, about \$18,000 was expended in prospecting, and now they hope to get back that amount and a big margin besides.

SPENCEVILLE COPPER MINER.—Work has been resumed at the Spenceville copper mine in this county, a large force of men being employed. The vein is being stripped at the top preparatory to working the mine from the surface.

MILLING AND MINING MENTION.—The new Frue concentrator at the Pioneer mill will be ready to start up this week.

The Murchie hoisting works are nearly completed, and the Superintendent expects to raise steam this week for the first time.

ED. MOORE'S MINE.—On Little Deer creek, about a mile above the city, continues to show a very favorable prospect. The ledge is 10 inches thick, and very compact. Assays made by Prof. Price at San Francisco show the ore to contain 31.5% of gold and \$7.34 in silver per ton.

It was expected that the Derby mine would be cleared yesterday of the water that has interfered with operations there recently. As soon as the workings are dry, the extraction of the rich deposit of gravel that was struck just before the water came in will begin. The deposit in question is said to surpass anything ever before seen in the mine for richness and extent, and the owners naturally anticipate an early increase in the size and frequency of shipments.

PLACER.

THE OLD TAYLOR MINE.—Placer Herald, Nov. 27: Work on the old Taylor mine, south of town, under the management of Mr. Faulk, is being pushed right ahead. The east drift on the 50 level is being crowded forward, and the further they go east the better becomes the quality of the ore. Steam power is used for hoisting and pumping. A chute for loading wagons has been built at the shaft, which affords a great saving of time and labor. Their new mill, which Mr. Faulk's company is one of the best in the county, is kept running much all the time. A new boarding house for the mine has just been built.

THE BAKER MINE.—Dutch Flat Forum, Nov. 29: The company owning the Baker mine, at the lower end of town, have resumed work. There is now a force of 16 men at work running powder drifts, laying water pipe, repairing the hoisting derrick and preparing generally to commence hydraulic mining as there is there is sufficient water to start a good head of water in the ditches. The Baker mine is superintended by Mr. F. M. Chadbourne, and has Johnny Simmons, an able and experienced miner, as foreman. Work is progressing rapidly in all branches, with the exception of running powder drifts. The cement and gravel is so hard work is necessarily slow. It has been about 3 years since any work has been done in this mine, because of the property being in litigation, which has been settled, and work will be pushed along in the mine continuously from the present time. There has been large quantities of gold taken out of the mine and plenty more still in it.

PLUMAS.

NEW MILL.—Greenville Bulletin, Nov. 24: On Monday, while coming here from Honey Lake valley, we called at the new location of Pierce and McDow, near the foot of Diamond mountain, and some 6 miles this side of Susanville. They have a 5-stamp mill on the ground and the building nearly ready, and intend to have the stamps running in less than 2 weeks. Their mine is a ledge, and

quarter of a mile from the mill, and connected by a good road. The vein averages 9 ft in width, at the 150 level. They have also an amazing outfall, and will soon be prepared to assay on a large scale.

GOLD STRIPS.—The entire winter supply of provisions, powder, candles, etc., is being hauled to this mine, having come up from San Francisco.

INDIAN VALLEY.—The tunnel from the Union mine progresses well, and will soon be completed, so it will probably be but 3 or 4 weeks until they will be milling rock. **PURVIS NATIONAL.**—The new Buckhorn furnace mentioned last week is now in position, and nearly ready for operation. A test of sulphuric acid has been made by R. M. Wilson with remarkably satisfactory results, showing over \$100 to the ton.

GREEN MOUNTAIN.—The ditch repairs are nearly completed, the pipe and flume mostly ready, and but a few days will elapse ere both mills can commence running. The water will be conveyed to the water house and rock room are being filled to their utmost capacity.

CUMBERLAND.—The claim shaft which we mentioned last week as having been broken, has been repaired at the Greenville Iron Works. It was sent to the mill yesterday and the latter will now be enabled to commence running next week. This is a practical illustration of the value of a foundry, as, but for that, the shaft would have had to be sent to Graysville at a heavy expense, and a delay of 6 weeks or more would have been caused. A fine rock is still found in abundance in the Garfield shaft.

TUOLUMNE.

PROSPECTORS.—Tuolumne Independent, Nov. 27: The mining outlook for our county is brightening on account of the interest taken by outside capital, who are developing paying properties. We merely mention a few in our mind at present writing.

THE JUSTICE MINE. recently purchased by an Eastern company, is showing up a good property. This mine, south of Sonora, has never been prospected to any depth. It is a fine mine, and is owned by a New York company, runs at right angles and contacts with the great bonanza mine in town. The company are making preparations to open the mine in good shape before building a mill—which is the only sensible way to mine.

THE LOUISIANA MINE. near Cherokee, is handed to San Francisco capitalists, and the mine has yielded such favorable returns in their mill work it is almost assured the sale will be consummated at a heavy figure. A survey has been made following up the ledge to where it crosses the master ledge of the county, and its point of contact is found in the ground of the Mastodon mine, belonging to the Boston and Pacific Mining and Investment Co., an Eastern corporation, and we are apprised that steps are about being taken to sink a prospect shaft at the point of contact to thoroughly explore the two veins. It is well known where the vein enters the Louisa mine, and the Louisa and Mastodon meet, there is sure to be an extraordinary valuable mine discovered. Our Eastern friends are in luck, and we predict the opening out of a mine second to none in the county.

THE OLSEN MINE. at the southwestern end of the county, is turning out 64 lbs of amalgam every 24 hours with only 5 stamps. This is about 44 lbs of solid gold. Their 10 stamps will shortly start up and the value of the property will be paid for. The pay ore is extensive, and our county carries off the palm as having, in this newly discovered property, as of old, the boss mines of the State.

It is reported that the Little Gem mine below Jamestown, belonging to W. N. Harris, has been sold for \$100,000.

THE T. C. WATER CO. are improving their ditch property. A new boom has been built on the Strawberry reservoir, 540 ft long out of heavy cedar timbers 12x14 inches, and fastened together with heavy straps and chains. They have also built a new suspension above Long camp, 84 ft over all strings, 14x14 square, 34 ft long; braces and caps 11x11. When finished a full head of water was turned on, which is considered about 2,000 inches. It was bound together so tight—every brace fastened to caps and strings with heavy bolts—that it is only detached 1 inch. The company are substituting pipe for the high flume at Shaw's flat; 1,200 ft 11-inch pipe will do the work.

NEVADA.

WASHOE DISTRICT.

The following statements have been made by superintendents of leading mines November 22nd and 30th.

EVERMAN.—Winze has been sunk and timbered 21 ft; total depth 120 ft. Incline upraise has been extended 34 ft, through porphyry and seams of quartz. Forman shaft, total length, 1,520 ft; rock in bottom very hard and rough.

CALDERONIA.—The pumps have been run an average of 153 hours per day.

BENTON.—Have completed the repairs on the incline and are now making preparations for extending crosscut N.

CON. IMPERIAL.—Are overhauling the pumps from the 2000 level to the surface and repairing damage caused by the fire. The water on the 2800 level is up to the top of the drift.

CHOLLAR-NORRORSS-SAVAGE SHAFT.—Work going on as usual. The pipe for the hydraulic pumps has been received, and Monday or next day will commence putting it in.

UNION CON.—From the 2400 and 2500 levels 227 tons of ore, assaying \$23.65 per ton, have been extracted.

POTOSI.—The drift south on the 2400 level has been extended 48 ft in very hard rock. During the 24 hours ending this morning, the material through which the drills have been run show signs of getting softer.

OVERMAN.—Winze has been sunk and timbered 21 ft; total depth 120 ft. Incline upraise has been extended 34 ft, through porphyry and seams of quartz. Forman shaft, total length, 1,520 ft; rock in bottom very hard and rough.

UTAH.—The new incline pumps started on Monday, and everything about the pump line is working well.

COS. VIRGINIA.—During the past week 301 tons of ore have been extracted from the 1750 level stopes, of the assay value of \$20.80. On the 2300 level the south drift has been extended 29 ft. During the week bullion to the value of \$35,350 has been shipped.

UNION CON.—The crosscut west on the 2400 level is out 64 ft. During the past week 43 tons of ore, assaying \$38.45 per ton, have been hoisted from the 2100 level.

DUN GLEN DISTRICT.

IMPORTANT SALE.—Silver State, Nov. 23: John Wentworth and John Wright went to Dun Glen, 18 miles south of this place, in early days and engaged in mining. They secured some valuable locations, but in consequence of the almost total desertion of the camp, could not dispose of them, and they had not the means to develop them. They never lost faith in the camp, however, but remained there when nearly all but themselves had left. They shipped ore from their mines occasionally, from which they realized sufficient to supply them with the necessities of life. The success of the Lang Syne mine, which was then worked for 30 years, and was successfully attracted the attention of mining men to the camp. Among others who went there was D. N. Brown, of Paradise, who had experienced the vicissitudes of a miner's life. He examined the Auburn and other mines, owned by Messrs. Wright and Wentworth, and agreed to pay a stipulated price for them within a specified time. He went to Chicago, where he had formerly resided, and got capitalists interested in the speculation. They examined the mines, sampled the ores, and were satisfied with the result. They purchased the property of Mr. Brown, and yesterday the sale was closed by the payment of \$75,000 by the purchasers at Wells, Fargo & Co.'s office, and the signing and acknowledgment of the deeds. The purchasers are L. S. Hodges and Charles L. Luntz, of Chicago, and Geo. C. Barnard, of Deadwood, who intend to develop the property this winter and build a 20-stamp to work the ore in the spring. To his pluck in purchasing the property, and his energy in getting capital interested to develop it, as much as to the perseverance of Messrs. Wright and Wentworth in staying by their claims under adverse and discouraging circumstances, is due the credit of placing what the best judges of mines pronounce a veritable bonanza of the richest kind of ore in a condition to have

it worked, and to encourage others to develop their mines so that capitalists will take hold of them. Many good miners are of the opinion that within a year, or two years at the farthest, Dun Glen will be one of the richest mining camps in Nevada.

ESMERALDA DISTRICT.

REAL DEL MONTE.—Herald, Nov. 27: Last Friday evening the nose of the cast-iron balance-hob on the 300 level broke, and the surface-bob not having sufficient capacity to carry the amount of ballast required, could not run the pump, and the water is now 200 ft deep in the shaft, and all work is suspended (except some necessary repairs to the machinery) until a new nose-piece can be procured from below. The Union Iron Works have made the casting, and is now on the way here, and as it only weighs about 3,000 lbs, the Fast Freight Company can bring it from Carson in 24 hours, so that if nothing unusual occurs the pump will be running again tomorrow. The main shaft has now a depth of 575 ft. The rock in the bottom is getting harder, and appears to be changing somewhat in character.

MILL CREEK DISTRICT.

STUCK IR.—Standard-News, Nov. 24: Larry Hoge, one of the early prospectors of Bodie, has been out prospecting in Mill Creek for the past 10 days, and has discovered a very rich mine in that district. Five ft below the surface a good-sized body of high-grade ore was struck, and men are now engaged in taking out ore for reduction. Larry deserves his good luck, and his many friends will join us in the hope that he may realize a million from his new find.

SPRING VALLEY DISTRICT.

LOOKING WELLS.—Eureka Sentinel, Nov. 21: Mr. E. H. Rose came in last night from across Spring Valley. He reports the mines over there looking well, especially so in the 6-20 and Woodchopper mines. A strong force of hands will be put to work the first of next month. The ore is very rich over there, and they have a good quantity in sight.

ARIZONA.

GOLDEN EAGLE.—Globe Chronicle, Nov. 25: The tunnel on the ledge, which also forms the 100 level, is now run 600 ft, all the way in good milling ore, which fills the ledge from wall to wall; its width, as shown in the crosscuts and at the points where they are stopping being from 4 to 15 ft wide. The main shaft is 240 ft deep.

TOWNSHIP MILL.—This mill was erected to work the free gold ore from the Townsend mine, and since it started has been running very steadily with good results in bullion. Mr. Tucker, the superintendent, however, finds that there is considerable gold in the ore which the milling arrangements do not enable him to save, while all the silver in it of course goes away with the tailings. He informs us that the owners in New York are now making arrangements for a complete 10-stamp silver mill.

GEN. HOOKER.—This mine is in the Gold Hill section, and has the largest gold lode hitherto opened in that vicinity. A tunnel has been run 160 ft to crosscut the ledge; and about 40 ft from the entrance they came upon ore through which they have now run 120 ft, with no signs of the further wall. The gangue of the ore is an easily worked quartz, and contains its metal entirely in the shape of free gold, which can be easily saved. The 250 tons on the dump is good milling gold ore, as the 20 average assays made run \$120 per ton.

LOUISA.—This claim adjoins the Gen. Hooker, running diagonally towards it, and is on a rich streak of ore, which is from 8 inches to 1 ft wide.

RETRIEVE.—This claim belongs to the same owners as the Hooker and Louisa, and the croppings on the surface indicate a ledge over 12 ft wide. An open cut 10 ft broad and 20 ft deep is being made, looking gold ore, which has a quartz gangue and carries 60 per cent.

QUARTZENAL.—In the surface tunnel, in both shafts and on the 60 level, the ledge shows a continuous body of high grade milling ore over 150 ft long and from 2 to 4½ ft wide. The main shaft is 95 ft deep.

GREAT REPUBLIC.—This mine is on the southern side of the Pinal mountains, and has a parallel ledge to the Pioneer West, which adjoins. The main shaft is 33 ft deep, and shows a continuous streak of rich ore from the surface to the bottom over 20 ft wide. The ledge is much larger than shows in the shaft. At the bottom of the shaft they are now running a crosscut to strike the hanging wall, and are in 4 ft from the shaft and getting out ore. There is on the dump 70 tons of high grade milling ore.

COS. & COPLAN.—This mine is about 8 miles northerly from Globe, and a recent visit brought its value more than ever forcibly to our minds. The main ledge on the claim is a contact vein between granite and syenite, but has not yet had its size definitely determined, although from the surface croppings it must be about 20 ft. A working shaft has been sunk on it 64 ft, all the way down being in low grade ore. There are 3 other shafts 25, 80 and 100 ft deep, which have been sunk on spurs of rich ore which can be traced diagonally to the main ledge. The 80-ft shaft has yielded \$10,000, and the others also large amounts of ore which returned from \$400 to \$500 per ton.

THE LADY BOB.—This property was recently purchased by N. A. & J. L. Clark, with a party in New York, and is now being worked under supervision of N. A. Clark. It is situated about half way between Richmond basin and Chrome mine, and is making a showing highly gratifying to the owners.

CROWN IMPERIAL.—The pay streak on the surface is 14 inches, and at a depth of 10 ft widens to 24. Several assays made by Mr. Kennedy give results as high as \$700 per ton.

THE ARIZONA MEXICAN MILL is working steadily and turning out bullion regularly from the rich ore which is yielded so plentifully by the Mac Morris mine.

THE CENTRAL SILVER MINE. Co. last week shipped 4 bars of bullion, valued at \$4,900.

THE ISABELLA MINE is running right along day and night on Centennial ore, which, since they commenced to roast, yields handsome returns in bullion.

We learn from Mr. B. H. Snyder that arrangements have been completed for the erection of a smelter on the lower portion of the ledge, which is being worked on Mineral creek. Work has already begun. The value of these claims is evidenced by a recent shipment of ore to San Francisco, which yielded 43% copper and some silver.

IDAHO.

BOISE COUNTY NOTES.—Yankee Fork Herald, Nov. 20: The Crown Point shaft at Banner is down 210 ft, from the bottom of which a 140-ft tunnel tapped the vein. At the point where it was cut it is 3 ft wide. The mine is prospecting better than ever before. Jim Irwin and Ben Miller are handling the tunnel, and the mine is making a fine show of the more creek summit. The contractors are busy taking ore out of the Sun Rosa mine, near Idaho City. A tunnel is being run to tap the mine at a depth of several hundred ft, and it will soon be in shape for being extensively worked. The Gold Hill mill at Quartzburg is running right along on good ore. A large hatch of ore from the Ebenezer mine was lately crushed in the Territory mill, and turned out well. Work has been suspended for the winter on the Summit Flat mines. Wilson & Whitney, the owners, made a good deal of money out of them this year. There is only a small amount of snow at Banner, but the depth at the head of West Fork is nearly 3 ft.

BONANZA CITY.—Idaho World, Nov. 23: Bonanza City promises to be the richest camp in the Territory next year. Five mills will be erected next spring, in addition to the new one now going up. The Custer company will put up a 20-stamp to do custom work. The Lucky Boy and Badger companies will each put up a mill, and stamps will take the place of the arrastra at the Charles Dickens. The fifth will go up either on the Anna or Summit mines.

MONTANA.

MAGNA CHARTA.—Butte Miner, Nov. 23: Yesterday morning a very important development was made in the north crosscut at a depth of 266 ft. It will be remembered that near the latter part of last week, at a distance

of 50 ft from the shaft, several ore pockets were discovered which were regarded as indicative of the proximity of the ledge, and their richness in silver was so great that high hopes were entertained of the value of the main body when tapped. The face of the crosscut was pushed forward with renewed energy, and at a point 50 ft from the shaft, the miners passed through what proved to be a well-defined well, beyond which, after the firing of several more blasts, the ore body was found to lay. Neither the width nor the richness of the ledge has yet been ascertained.

NORTH STAR.—At a depth of 63 ft the east and west drifts are being extended with vigor, and are producing considerable ore. The drift running east is in 40 ft, and the one running west 35 ft. The ledge, though well defined, contains some worthless ledge matter, leaving the pay ore body not more than 2 ft wide. This is being extracted and shipped to the Copper mill which it keeps in constant operation.

ANSELMO.—The main shaft has attained a depth of 135 ft, and is still going down. In the west drift of the 100 level stopping continues on a body of ore which varies in thickness from 4 to 7 ft, and assays between \$125 and \$200.

COLUMBA.—The work of widening the 100 level to the full width of the vein having been finished, stoping of the east drift has been resumed, and sufficient copper ore to keep the smelter supplied is being extracted daily. That portion of the product which assays higher than 35% copper, is being sacked for shipment, the low-grade ore being conveyed by the air tramway to the smelter, where it is concentrated, desulphurized and formed into a matte.

AURIC.—On the 100 level considerable work has been done within the past season, but such is the magnitude of the ore reserves, that what ore has been taken out is scarcely missed, and makes very little difference in the dimensions of the ore bodies yet in sight. This drift has yielded considerable free ore lately, which has been used to mix with the product of the lower levels for experimental purposes. It is not considered likely, however, that the level will be extensively worked at present. The vein between these levels has been opened up to an average width of 15 ft, leaving heavy reserves on either side of the workings, which will be extracted and treated on the erection of the projected wet crushing mill some years hence. Between the second and third levels a change in the character of the ore is noticeable, the free ore having entirely disappeared. The 500 level is in splendid shape for working purposes, and considerable improvement is noticeable in the compactness and richness of the ore as compared with that of the upper levels. This fact is a most reassuring one, and goes far to show what may be expected when the ledge shall be tapped and developed from the 700-ft crosscut.

STEVENS.—This sterling property is opening up in excellent shape. The breast of ore in the face of the east drift of the new shaft is 2 ft wide, and is yielding rich ore, which lies clean and compact with well-defined walls.

OREGON.

GENERAL ITEMS.—Democratic Times, Nov. 21: Chas. Schultz has purchased Pony Hampton's interest in some diggings on Rich gulch. F. C. Ream will return to Pickers creek this week and commence preparations for mining his claim there the ensuing winter. T. L. Beck, of Willow Springs, was over to Hord's saw-mill, on Poorman's creek, this week ordering lumber for new flumes. He will commence shoveling in as soon as water starts. The Sterling company will extend its ditch 3 miles this season, which will bring water on some excellent ground. C. J. Howard has been engaged in surveying out its course. Keaton & Co. have worked out the ground laid bare by their windmill in Rogue river, with fair returns. They will take out the dam and suspend river mining for the winter season. Jack Layton is about enlarging and improving his old Williams creek ditch, that it will give him more water with which to work his diggings. He is making extensive preparations for the ensuing winter. Geo. Schumacher purchased his partner's interests in the Rockefeller ledge near Willow Springs, and will vigorously prosecute the work of prospecting it. Whenever the tunnel is completed crushing of ore will follow, as he has made arrangements to put up machinery on the ground before long.

UTAH.

SILVER REEF NEWS.—Miner, Nov. 21: Before the old year turns his toes to the daisies, the 20 stamps in operation in Silver Reef will have added their annual quota of nearly \$1,200,000 to the world's wealth of bullion. Assessment work is now progressing on numerous claims, and will be commenced on several more in a short time. The bullion shipments from Silver Reef, through Wells, Fargo & Co., from the 11th of November to the 17th inclusive, aggregate the sum of \$22,520.91. The contract for sinking a 60-ft shaft on the Empire mining claim, situated on the lower portion of the White rock ledge, has been awarded. At this depth it is expected to strike a ledge of high grade ore, which crops out at other points of the claim, and, should this be the result, the Empire promises to develop into a mine second to none in the district. Development is all that is necessary to convert several fine claims in the locality of the Empire into first-class paying properties.

THE PIONEER TELEPHONE.—The telephone pole to use in the mine in this district has been erected, and is, rather put down, in the Barbee & Walker, and proves to be a great convenience, and will soon pay for itself in time saved in communicating with the hoisting works on the surface. Previous to the introduction of the telephone, the only means of communication was by the ore-car, which involved the delay of loading when picks or tools were wanted. The telephone makes it possible for the ore mines is a new thing, but must be generally adopted for their convenience and economy being apparent.

THE LAST CHANCE MINE.—Salt Lake Tribune, Nov. 29: The Last Chance mine, at Bingham, which has long been known as the English Co.'s property, is about to start on a new career of prosperity. No property on the coast has a better record, and none promises a more brilliant future. The new management has a program of development. Recently the manager has purchased the Hooper mine, on the southwest, the Opulent and Silver Maid, and consolidated them with the Last Chance. These are splendid additions. We understand that all the necessary machinery has been purchased to commence and carry out the thorough opening of the property.

THE GILBERT MINE.—Salt Lake Tribune, Nov. 29: The Pacific coast at Mount Shasta, yesterday brought to the Tribune office a magnificent specimen of cinnabar, and laying it out on the reporter's table said: "I come to vindicate Prof. Newberry. That stone, according to this assay—showing an assay certificate—goes 13.12% in mercury, and the whole ledge runs from 2½ to 14½, and it is 40 ft wide. The ledge makes it a 20-mile wide, and it is in the same allowance. Coming down to the true business, the amount of ore is simply immeasurable. I have been working and holding on for 8 years. I have not been financially able to do all that I intended to, but I want the Tribune to state that when Prof. Newberry told an Eastern audience that there was mercury in Utah, and lots of it, he understood the real facts."

THE GILBERT MINE.—Old Telegraph is to commence operations shortly. It is rumored that a lease has been granted to Mullet, Stansfield and others. Twenty-five men are to be put to work, and the old mine will shortly resume its usual shipments. The Mary Lee, owned by C. H. Lashbrook, is working 2 men. A tunnel is now being run to tap the vein. It is in about 80 ft, and is 20 miles in length. John D. Smith, John D. Smith, and John D. Smith are working the plan of W. E. Blenny. The pay streak has been tapped and gold dust is now in order. Jones & Housholder are running a new tunnel on the Ashton. The ore extracted brings in the market about \$120 per ton. W. Delamore & Co. are working the Caledonia, the ore they are taking out is said to average 250 ounces of silver and 20% of gold. The mine is being prepared for a winter campaign. Lumber is being hauled up to the mine to erect a house for the men. W. E. Blenny is opening out his lead and silver vein of the Overland. The vein looks strong and is widening out; assays pay out A. 1.

West Coast Land Birds.

Introductory Remarks.

We intend to give our readers a series of articles on the influences, both good and bad, exerted by our land-birds on the cultivation of all kinds of crops along the Pacific slope. The articles will be prepared by one who has made them a special study for twenty-five years past. We intend to reproduce the engravings, of such birds as we shall select, from the "Ornithology of California," one of the reports of the State Geological Survey. Fuller accounts of all the species may be found in the "History of North American Birds" by Baird, Brewer, and Ridgway, three volumes, quarto, 1874. The articles themselves, however, will be entirely new, and will contain much original matter never before published, besides the necessary quotations from other authors. We cannot definitely announce when other articles of the series will appear,

in their places. Very little observation will show that such hills can only be used to catch insects, or to pick a little at soft fruits. All these birds are smaller than the meadow-lark. Leaving the characteristics of the other groups to appear, in their proper places, we proceed to describe the families and species.

The Thrush Family.

According to the latest classification, these birds and their relatives present us with the most typical examples of the bird-form known, for their structure shows the least approach to that of the reptiles below them, and the mammals above them, in the scale of development. They are therefore placed by most authors at the head of their class. We have not yet learned on what principles to divide it, so as to arrange the families in regular order from the lowest to the highest, with these at the middle of the series, while those nearest to the lower and higher classes may be the ones at each end.

American Thrushes.

The typical genus of the family is that to

More interesting to us is the "Oregon thrush," Fig. 2, described from that State, but now found to be very common throughout California in summer, except along the large interior rivers and in woodless tracts. It is over seven inches long, uniform reddish brown above, somewhat olive toward the tail, the breasts with spots darker than the back but not black. The pale brown tints gave origin to its scientific name which may be translated, scorched thrush (*Turdus ustulatus*, Nuttall). There is, however, an eastern variety known as the olive-backed thrush which is nearly of the same tint as the hermit, differing chiefly in absence of reddish on tail, etc., (variety *Suainsoni*). This form is common in the Rocky mountains, and has been reported to visit California occasionally in its migrations.

Our summer thrushes are, however, more or less of the burnt-brown tint, and are among our most melodious singers, their metallic ringing notes resounding in spring from the thickets along every stream near the coast, and in the high mountains, especially toward evening,

similar plumage, but there are two of our species still larger, with much heavier bills. The first is known everywhere in America by the name of robin, from its red breast, though in size and shade of red the English robin is very different, more like our bluebird, which it also resembles in habits. Though so different in plumage from the typical thrushes, this robin-thrush, when young and newly fledged, has its breast whitish, thickly spotted with black, resembling very much the fieldfare, a thrush of Europe, but after its first moult loses the spots and becomes red-breasted, thus developing to a grade higher than the spotted ones. The adult male has the head black, except three white spots about each eye, and a white-spotted throat; back olive-grey wings and tail blackish-brown, the outer tail feathers with white patches at ends, lower parts about the tint of redwood, white under tail, bill yellow. Female and young birds less brightly colored. Length 10 inches.

The robin, so well known in the Eastern States, is a rare bird in most of the older set-

WEST COAST LAND BIRDS—THRUSHES, ROBINS AND MOCKING THRUSHES.

but we trust they will not be long delayed. The plan to be followed, though in the same order as in the Ornithology of California, will not be so strictly scientific as to unfit it for popular reading, while at the same time, none of the practically scientific views of the subject will be omitted. According to modern classification the land-birds are arranged nearly as follows, from the agricultural point of view: 1, insectivorous singers; 2, graminivorous singers; 3, omnivorous singers; 4, fly-catchers; 5, grub-eaters; 6, vermin-killers; 7, game-birds.

In this order it is proposed to describe briefly each bird, and to give its habits more fully. These divisions do not agree strictly with scientific classification, which is founded on structure more than on habits, but the place of any bird in the above arrangement can be generally ascertained by the figures and brief characteristics given.

1, Insectivorous Singers.

The first division includes those with rather short and slender bills of about equal breadth and height at the base; straight when short, much curved when longer than the bird's head. The mocking-birds, wrens, titmice and hutchers-birds, furnish us with examples of various forms of the bill found in this division, and

which the true thrushes belong, of which we read in English books, but which are somewhat different from their American consins. The European thrushes are among the finest song-birds of that continent, and are fully equaled by some Atlantic coast species, as for instance the wood-thrush, and by the hermit-thrush.

The latter only visits us, and to some extent winters in California, going north of the United States in summer and never favoring us with its brilliant song, although some will probably be found to linger through the summer about our highest snowy mountains, as they do in the Rocky mountains above 8,000 ft. altitude.

The western hermit-thrush (*Turdus nanus*, Audubon, meaning dwarf thrush), Fig. 1, is the smallest of American species, about 6½ inches long above light olive brown, becoming reddish toward the tail, beneath white, with a huffy tint on breast, which is thickly spotted from the sides of hill downward with triangular dusky spots more rounded beneath. It is a very shy bird while with us, though occasionally coming around shrubbery in gardens, seeking insects chiefly on the ground, and entering only a sharp chirp of alarm. Varieties of this species are found in the Rocky mountains much larger, and one of intermediate size in the Eastern

when they delight to visit gardens and seek for insects until dark. They may occasionally pick a cherry or other small fruit, but are among the gardeners best friends, from their destruction of insects, and should be protected. Among our boys of foreign parentage, they are often called whistlers and sometimes even nightingales, but are much inferior in musical power to the other species mentioned before, their song being of but a few notes often repeated, and their alarm note a whistling though loud chirp.

The nests of this bird are built on low bushes or trees, of wet leaves and twigs, warmly lined with root-fibres, and often covered outside with green moss, the walls very thick and solid, the cavity deep. The eggs are bluish-green, varying in tint and in the amount of light or dark-brown blotches that nearly cover them.

Those of the hermits, as far as known, are without spots, and their nest is built on the ground. This bird, after its summer residence as far north as Alaska, returns to California about the end of September, and remains here until April, while the Oregon thrush arrives from Mexico in April, and stays with us until September.

American Robins.

The little thrushes just described are surpassed in size by the Eastern wood thrush,

which they delight to visit gardens and seek for insects until dark. They may occasionally pick a cherry or other small fruit, but are among the gardeners best friends, from their destruction of insects, and should be protected. Among our boys of foreign parentage, they are often called whistlers and sometimes even nightingales, but are much inferior in musical power to the other species mentioned before, their song being of but a few notes often repeated, and their alarm note a whistling though loud chirp.

Their lively and varied songs, with their confiding habits in places where they are protected, make them universal favorites, and often save them from the slaughter too hastily pronounced against so many other birds. They are often kept in cages, and become very interesting pets, learning to imitate various tunes and sounds heard around them.

Their nest is built, like the thrushes, in a low tree, or sometimes in a building, but made more solid by a layer of mud, which dries like mortar, and the eggs are dark bluish-green, unspotted.

Being hardy birds, they winter even where snow covers the ground, living on wild berries and wandering about in large flocks, from which they have derived their scientific name (*Turdus migratorius*, Linnæus), Figs. 3 and 4. Western birds differ from Eastern only in longer tails and more extensive white patches, especially

The Western, or "Oregon" robin (though not well named as we have also the Eastern kind just described), is called by authors varied thrush, a translation of its scientific name, (*Turdus naevius*, Gmelin), Figs. 5 and 6. It is the handsomest North American species, being slate-colored above the lower parts, with a stripe behind the eye and two bands on each wing rich orange chestnut; the breast crossed by a black band; beneath tail and ends of tail feathers, white; female duller; length a little less than that of the robin; bill black; feet yellow. This beautiful bird is only a winter visitor among us, going in summer even to Alaska, where they are said to have a brilliant song and habits much like those of the robin with which they associate while here, though more silent and shy. They arrive here in October and leave in April. Large flocks of this and the common robin arriving early in fall indicate a cold and wet winter.

Mocking Thrushes.

Although at first sight the well-known mocking-bird does not look very much like the spotted thrushes or the robins, there is a link connecting them found in the arid "sage-brush" regions of California and eastward to the great plains, called the Mountain mocking-bird (*Oreoscoptes montanus*, Townsend), Figs. 7 and 8. This bird is 8½ inches long, brownish-ashy above, dull white below, thickly marked with triangular spots, the wings and tail brown, tail feathers white tipped, bill brown, white below, feet elaty, soles yellow. Thus plainly colored, it is well suited for concealment among the gray shrubbery of its native haunts, where it is one of the few fine singers that enliven the dreary waste with songs of great variety and sweetness. They live on insects and berries; migrate but little, and lay dark green eggs spotted with brown.

The true mocking-bird, of which the scientific name means many-tongued mimic (*Mimus polyglottus* Linnaeus), is more common in southern California, but many are kept in cages in the northern part of the State, Oregon, etc. These western birds showed tendency to variation from the eastern in having tails more lengthened, as have many other western forms of birds familiar to settlers from the East. They do not, however, vary in plumage, which is ashy-brown above, brownish-white beneath, wings and tail brownish-black, with two bands of white across wings, and white tips to tail feathers. Length, 10½ inches, of which the tail is 5½; bill and feet black, eye yellow. They inhabit the thickets of tall cacti and other thorny plants, feeding much on their fruits, and building a large, loose nest among them, in which they lay four or five pale green, brown-spotted eggs. They migrate only from the more northern part of their range, which is near lat. 33° in the San Joaquin valley, and to 42° or more on the Atlantic coast. Their wonderful powers of imitation are well known, and excel those of any other bird, except a few closely allied tropical species. Not being numerous anywhere, and of a shy disposition, they do little if any injury to fruit.

I now come to a genus of birds that would appear, in some cases, too different to be classed with the thrush family, yet we find it linked to them by a regular chain of species, gradually differing more and more. They derive their generic name from the remarkable bow-shaped bill found in the California species, but which dwindles down to near that of the robin in the southern and eastern forms. They all have some of the mocking power, and are often called false mocking-birds; sometimes thrashers (a corruption of thrushes). The common California species, Fig. 9, from which the generic name was first given, might better be called *Reaper* than thrasher, as its bill is nearly sickle-shaped (a form however now scarcely known to American farmers), or more properly perhaps, horn-hook shaped. Bow-bill is, however, nearly enough correct, and translates the scientific name of the genus, *harporhynchus*, while the specific name of this one is *ridivivus*, as named by Dr. Gambel, to express its "revival from oblivion." It appears that the celebrated voyager, La Perouse, during his circumnavigation of the world, about 1790, obtained this bird in California, and it was described and figured in his narrative in 1797, under a French name, after which it was unknown to naturalists until Dr. Gambel obtained it here in 1843.

Our bow-bill is 12½ inches long, wing 4 1-5, tail 5½, bill over 1½, legs about the same, so that the length of bill at once strikes the observer as oddly proportioned for a singing bird. Above, olive-brown; beneath, pale cinnamon, deepening into reddish-brown under tail, more like black on the breast. This plain plumage is exactly suited to the dry thickets the bird inhabits, where it scratches with its long bill among the dry leaves for the insect food which is its almost entire subsistence, merely varying this diet occasionally by fruits in their season. It is a very shy bird, living chiefly in the shrubbery tracts called by the Mexicans, "chapparel" and "chemisal," which grow usually in poor, gravelly soil, and thus keeps away from the most cultivated districts.

I have known them, however, to inhabit a willow grove around a large spring, and quite near a farm-house, where their varied and lively songs were among the most pleasing in the choir of feathered musicians that enlivened the early morning during the first six months of the year. This song is composed chiefly of imitations of those of other birds, and in the northern mines, where the true mockers are not

eggs also resemble those of the mocking-birds very closely.

Among the sand hills and rocky barrens that constitute the desert region between the Coast range and the Colorado river, where low, thorny bushes occasionally grow with cactus and yuccas, there is found a variety of this bird which shows the effect of the hot arid climate in being of a light grayish ash color above, paler below, but the tail darker below than above where exposed to more light. It is also about one-sixth smaller.

Still farther east, in Arizona, is a larger species, scarcely different from ours, but lays unspotted eggs, while toward Mexico appears two or three other kind, with breasts more or less spotted, like that of the thrushes. The bill in these is also shorter and straighter than in ours, until in Texas appears the well-known Eastern species called the "brown thrush" or thrasher (*Harporhynchus*), a rare straggler to California, of a bright rufous color, white below with black spots, forms a connecting link again with the typical thrushes.

USEFUL INFORMATION.

How to Make and Use Glue.

A writer in the *Furniture Gazette* gives some practical hints on glue and gluing. His method of making the common cement is as follows: Break the glue into small pieces, put it into an iron kettle, cover the glue with water, and allow it to soak twelve hours; after soaking, boil until done. Then pour it into an air-tight box; leave the cover off until cold, then cover up tight. As glue is required, cut out a portion and melt in the usual way. Expose no more of the made glue to the atmosphere for any length of time than is necessary, as the atmosphere is very destructive to made glue. He adds: All the glue as received from the factory requires the addition of water before it will melt properly, and every addition of water (while the glue is fresh made) will, up to a certain point, increase its adhesiveness and elasticity. Some glues will bear more water than others; but all will bear more water than usually falls to their share, and that, too, with a greater improvement in the quality of the work. For glue to be properly effective, it requires to penetrate the pores of the wood, and the more a body of glue penetrates the wood the more substantial the joint will remain. Glues that take the longest to dry, are to be preferred to those that dry quickly, the slow-drying glues being always the strongest, other things being equal. Never heat made glue in a pot that is subjected to the direct heat of the fire or a lamp. All such methods of heating glue cannot be condemned in terms too severe. Do not use thick glue for joints or veneering. In all cases work it well into wood in a similar manner to that painters do with paint. Glue hot surfaces of your work, excepting in case of veneering. Never glue upon hot wood, or use hot cauls to veneer with, as the hot wood will absorb all the water in the glue too suddenly, and leave only a very little residue, with no adhesiveness in it whatever.

Turpentine not a Drier.

Oil, or spirits of turpentine is generally supposed to be a drier, and is used as such, while in fact it is only a thinner and has no drying properties in itself. This has been repeatedly proved in various ways, but the following simple experiment will suffice: In two vessels of equal size and shape put equal quantities of linseed oil, and with one mix a quantity of spirits of turpentine. Allow both to be exposed to the same atmospheric influences and watch them. Very soon you will find the quantity in each vessel to be alike, showing that the turpentine has entirely evaporated, after which, if you can perceive any difference in the rapidity of the drying between the two, it will be in favor of what was originally the pure oil. When a mixture of linseed oil and spirits of turpentine is spread out over a surface, the effect is produced which has led so many to call turpentine a drier.

The turpentine rapidly flies off, and the oil is left in a much thinner body than if it had been applied pure, and the air has so much the better chance to operate on it, but the turpentine has left nothing behind to aid the hardening or drying process. Painters like to use it because it makes the paint flow more readily, work easier and spread out better. For inside work it is desirable, because as the rule the object is to apply to the surface covered as little oil in proportion to the pigment used, as possible, while for outside work the reverse is the case. Turpentine and benzine are almost identical in their mode of action, the benzine being the more volatile and escaping the more quickly. Neither should be used for the outside of a house, but for the inside they answer not only the purpose spoken of above, but, as they evaporate a "flat" surface, as it is technically called, is formed, and this is generally more highly esteemed.—*Ex.*

TO FIND THE CAPACITY OF A HOPPER.—Multiply the length by the breadth, and this product by one-third of the depth measuring to the point (in inches), and divide the last product

Roasting with Hot Water.

A most novel and interesting experiment is now being conducted at 256 West 125th street, New York city, where the Prall Union Heating Co., have erected a plant to demonstrate the principles involved in their system of supplying steam for power, or for heating purposes, and heat for cooking purposes. An ordinary steam boiler is used to heat water to a temperature of about 400°. This water is supplied through pipes to an oven around which it circulates, giving to the oven a heat which is sufficient to roast, bake, or effect any of the cooking results usually obtained with an ordinary cooking range.

It has been found from practice that an ordinary mutton chop required 7½ minutes to broil, and a piece of beef about 1½ inches thick, weighing about 1½ lbs., was overdone after being in the oven 19½ minutes. In both cases the meat was fairly browned, possessing all the characteristics of meat roasted or broiled in the usual manner.

The operation of the oven is simple in the extreme, nothing to do but turn on the hot water and the oven is ready. This system possesses several prominent advantages over the common range. In the first place the heat of the oven is more uniform, in fact, quite uniform, and it is simply a matter of experience to know exactly how long it will require to cook a joint of a given weight. In the next place, there is no danger of the oven getting either too hot or too cold, hence the trouble of managing and regulating the fire is dispensed with. Again, the oven is always ready, day or night. We understand that it is the intention of the company to supply with their ovens all the appliances necessary for conducting all culinary operations. In the experimental plant the ordinary house boiler is heated from water that has passed around the oven, and this without the least noise. The operation is as simple and efficient as can be, possessing, like the oven, the advantage that it is always ready for use, and the further advantage that hot water can be had at an equal temperature even though the faucet is kept constantly running for use. These demonstrations are well worthy of attention, their simplicity and effectiveness being quite remarkable.—*Scientific American.*

GOOD HEALTH.

Rapid Breathing as an Anæsthetic.

Dr. Bonwill, in a paper read before the Philadelphia Medical Society, and reported in the *Medical Times*, stated that in dental and other operations not requiring more than 20 or 30 seconds he had found that persons could be rendered insensible to acute pain by rapid breathing, carried as far as 100 respirations in the minute, consciousness and general sensibility remaining intact. The patient feels every touch, and in order to be exempted from pain the inspirations must be kept up vigorously during the whole operation without stopping for an instant. It is difficult for a person to respire more than 100 times in a minute, in consequence of the exhaustion produced, and for a minute after the end of the process he cannot breathe more than once or twice, and a very few can raise hand or foot. During the last four years, Dr. Bonwill, by employing this plan in dentistry, has been able to do without any anæsthetic; and in major operations less of an anæsthetic is required when rapid breathing has first been employed, the after-effects also being much less unpleasant.

The New York *Medical Record* remarks on the above: A perusal of the papers and discussions on this subject leads to the conclusion that there may be something of practical value in Dr. Bonwill's discovery. It seems that analgesia to a greater or less extent can be obtained by it; but its practical usefulness is not so well established. A good many failures have occurred, but the method is so simple that there ought to be no trouble in determining its exact value. The most favorable position for the patient is lying down on the side, and it is generally best to throw a handkerchief over the face, so as to prevent his attention from being distracted. He should then be directed to breathe at the rate of about 100 respirations in the minute. The direction best given is to "blow out" in rapid, puffing respirations. At the end of from two to five minutes, the patient continuing his rapid breathing all the while, teeth may be drawn or incisions made, and there will generally be an entire or partial absence of pain, which will last 30 seconds or more. According to Drs. Garrettson, Hewson and Kite, it takes from one-half to three-fourths less of the liquid anæsthetics to produce insensibility when their administration has been preceded by rapid breathing.

FOR CHAPPED HANDS.—A good preparation for chapped hands is composed of quince seeds and whisky. There is no rule as to proportion. Put the seeds in a bottle, and pour in enough whisky to cover them. As this thickens, add more whisky, until it is of the right consistency. This healing preparation is far superior to glycerine, as it dries off quickly, and leaves a most agreeable odor. Try it, and you will never be without a most valuable addition to your medicine chest.

Baby's Bow Legs.

These need not cause anxiety in all cases. If the child is healthy and has good, nourishing food and pure air—the two great essentials for making good blood—it will probably outgrow its bow legs naturally enough as its strength increases. Rubbing the legs with your hands in the morning may help to strengthen and to straighten them, holding them straight as you rub them. If the case is pretty bad, the two legs may be bound together with comfortable bandages during sleep, rubbing them well before and after binding them. If the child is quite young, it may be kept from standing on its feet for a few months, giving nature time to straighten the crookedness while the limbs are growing stronger. A carriage and a high chair are helps toward carrying out the plan.

All the things that have been mentioned as curative agencies may be used as preventives. A healthy child, with wholesome food and pure air to breathe, if kept from standing and walking while too young and weak will not have bow legs. Scrofulous children are more likely to suffer in this way, and those that are very fleshy. Don't take pride in your fat baby. Excessive fat is really a disease, instead of a sign of health. Fatten your pigs as much as you fancy, but do not deliberately fatten your children. Give them plenty of good, growing food, and they will be plump enough for symmetry, and not too heavy for comfortable activity. It is no wonder that the little legs bend under the heavy weight of some fat little toddlers. Such children should not be encouraged to stand or walk until they have grown strong enough to do so of their own accord, and then should not be allowed to walk too much.—*Sanitarian.*

Cold Feet and Sleeplessness.

A writer in the *British Medical Journal* thus discourses on the above subject:

The association between cold feet and sleeplessness is much closer than is commonly supposed. Persons with cold feet rarely sleep well, especially women. Yet the number of persons so troubled is very considerable. Cold feet are the bane of many women. Tight boots keep up a bloodless condition of the feet in the day, and in many women there is no subsequent dilatation of the blood-vessels when the boots are taken off. These women come in from a walk, and put their feet to the fire to warm—a most effective way to cultivate chilblains. At night they put their feet to the fire and have a hot bottle in bed. But it is all of no use; their feet still remain cold. How to get their feet warm is the great operation of life with them—in cold weather.

The effective plan is not very attractive at first sight to many minds. It consists in first driving the blood vessels into firm contraction, after which secondary dilatation follows. See the snowballer's hands. The first contact of the snow makes the hands cold, for the small arteries are driven thereby into firm contraction, and the nerve-endings of the finger-tips feel the low temperature very keenly. But, as the snowballer perseveres, his hands commence to glow; the blood vessels have become secondarily dilated, and the rush of warm arterial blood is felt agreeably by the peripheral nerve-endings. This is the plan to adopt with cold feet. They should be dipped in cold water for a brief period; often just to immerse them and no more, is sufficient; and then they should be rubbed with a pair of hair flesh-gloves, or a rough Turkish towel, till they glow, immediately before getting into bed. After this, a hot water bottle will be successful enough in maintaining the temperature of the feet, though, without this preliminary, it is impotent to do so. Disagreeable as the plan at first sight may appear, it is efficient; and those who have once fairly tried it, continue it, and find that they have put an end to their bad nights and cold feet. Pills, potions, lozenges, "night caps," and all narcotics, fail to enable the sufferer to woo sleep successfully; get rid of the cold feet, and then sleep will come of itself.

THE DIARRHŒA OF INFANTS.—During one of the discussions on the alimentation and disease of infants, which now occupy so much attention in France, M. Jules Guérin stated that the addition of a little charcoal (about half a teaspoonful of Belluc's or other finely-powdered charcoal) to a nursing-bottle full of milk exerts a most remarkable curative effect upon the diarrhœa of infants. He has repeatedly seen children who had become exhausted by seven or eight days' duration of an obstinate diarrhœa regain all the appearance of health in two or three days. At the same time that the charcoal is added, the milk should also be diluted with a half or a third of sugared water, the children taking the mixture without any repugnance, and no vomiting being induced.

TO MAKE LEECHES TAKE HOLD.—In the *Philadelphia Reporter* the following plan is commended as effectual in all cases when the leeches are healthy. Put the animals in a small glass vessel half filled with water. The part of the body which is to receive them is carefully washed with warm water, and the glass is quickly inverted upon the skin. The leeches attach themselves with surprising activity. When all the animals have bitten, the glass is carefully removed, the water escaping being absorbed by a sponge. If a single leech is to be applied, the same plan is adopted, using a test tube in place of a glass; by this means the animal may be compelled to bite at just the

The Week.

The principal matter of local interest this week has been the rain, which began falling Tuesday morning, when a strong southeast wind set in, with a good downpour of rain. And this has been felt over a good portion of the State, so it is not so much of a local matter after all. The gravel miners will rejoice, for a few heavy rains like this will soak their ground and set their ditches running. They are all ready, and some have been waiting a month for the rain.

The current mining news of the week will be found in our "Mining Summary." From all portions of the coast we hear of vigorous prospecting and steady working of old claims. A stream of miners is flowing from many parts into Arizona and New Mexico. One of the Arizona papers this week warns miners not to come there seeking employment now. So many men have come into the Territory that the avenues of labor are pretty well filled.

The advance of the railroad in that direction, however, is going to bring to the front a grand mining section in that Territory and New Mexico. Old Mexico, too, will be traversed by the hardy prospector before long. The mountains of Sonora will be ransacked high and low before many years. The miners are the pioneers of civilization, and there is a large extent of country thereabouts in need of civilizing influences.

SWELLING CLAY.—They are finding some curious rock in the Suto tunnel, south header. The *Enterprise* says: The rock, however, is liable to give trouble hereafter, as it is of a kind that swells in an amazing manner. But that men are kept on watch to cut it out it would close in behind those who are at work in the face of the drift and completely imprison them. The men on one shift a day or two since worked like Trojans, taking out 45 carloads of dirt, and at the end of the shift the tunnel was not as long by 18 inches as it was when they started. The earth—which is a mixture of clay and boulders—came out at the face of the drift like the pith from an elder. Some of the men swore that there were fellows on the other side pushing it through. Those who have ever seen what

The Poor Man's Mill.

We do not often hear anyone say anything in praise of the hurro, yet the hurro, as any miner knows, is a most useful little animal in his place. He will not cut the dash that a trotter will; but he will live on less, do more work, cost less and be more patient under adversity. He will not go so fast as a trotter; but put him on a mountain trail with a pack, and he will kill half a dozen of the fancier breed. But people do not often praise him much. Probably because we are used to him. The telegraph informs us of all the movements of Maud S. or St. Julien, and how they heat time, etc. We never recollect having seen anything or any telegram about a hurro. He is, apparently, beneath the notice of the telegraph. But the country could get along very much better without Maud S., St. Julien and others of their kind, than it could without the hurro.

In the same way you do not often hear anyone say much about arastras. We hear a good deal about 10-stamp mills, and 50-stamp mills, and 80-stamp mills. They form subjects for a great many telegrams, and they have cost more than Maud S. a dozen times over, in many cases. Yet, for the miner, the working miner, in a gold country, they never have done as much as this simple old arastra. We are so used to these that we are apt to ignore their merits. Half the time we do not use them when we can; looking upon them as primitive implements.

And yet the arastra, with all its great rudeness, is worthy of praise. It is the poor man's mill. A mule is cheaper than an engine; his grub costs less than coal, and a cluh or black snake is equal to an engineer, at the same time costing less. You run your own mill and pay no money out to mill companies. What gold comes out of the rock you get and you do not have to divide on it as some mills make you do without your knowledge. With free gold an arastra will heat the best mill ever built, in results. Amalgamation is more satisfactorily accomplished in an arastra than in the finest quartz mill. You do not break down and have to wait for "castings," and you never have to build a big house to cover in your machinery.

You build your own mill in the first place; get out the rock; hew the timber, and set the whole up. When you run it you are your own engineer, foreman, amalgamator, feeder and superintendent. You boss the job yourself. You can stand at one side and break the rock, and keep the mule going by throwing pieces at him. If anything goes wrong, a single "whoa" stops all the machinery immediately and quicker than any engineer and throttle ever stopped a quartz mill. If you go away a few minutes there is no danger of anything blowing up or going wrong, for the mule will stop and the whole outfit remain quiet waiting your return.

You have no insurance to pay. There is no great loss on equipment if the ledge "peters" on you. You are independent of custom mills, and know what is really in your rock. You haven't any very big water bills to pay.

Any miner of common intelligence can learn to run an arastra easily enough. There is not much of any science about it, but a good deal of common sense.

If miners in camps where the ore will admit of it, would go to work with their own arastras instead of waiting for capital or for mills, we would have more prosperous camps and more well-fixed miners.

QUARTZ MILL BURNED.—On the 29th ult., the works of the Scadden mine, below Boston ravine, Grass Valley, were burned. The entire establishment was destroyed, consisting of a large building, in which were two stationed engines, and the mill building attached, with two five-stamp batteries, pans, sluices, and all the necessary outfit. Beside destroying the buildings the fire communicated to the wood work of the shaft, which was burned down a distance of about 30 ft.; but its further progress was subsequently stopped by conducting a stream of water down the shaft from an adjacent ditch. The pumping engine was a powerful machine, formerly in use at the Pennsylvania mine at Brown's valley, Yuba Co. It is badly damaged, and perhaps ruined. The smaller engine, for driving the batteries, does not seem in as bad a condition. The mortars of the battery can be used again. The works were erected less than two years ago, at a cost of \$21,000, and were considered cheap at that price, as the machinery had been purchased at a low figure. The property was insured for \$6,700.

STILL ANOTHER.—Suits continue to be brought by stockholders against officials who fail to file their reports required by law. Chas. A. Trowbridge has commenced suit against H. Bartling, E. Moreau, A. G. Hawes, W. O. Gould, and George W. Dietzler. Directors of the Oro Blanco mining company. The plaintiff, being a stockholder in the said company, charges the above named Directors with having refused, failed and neglected to post or caused to be posted the receipts or expenditures of the company for the months next preceding the first Monday of May, June, July, August, September, October and November, which failure and refusal is a violation of the statutes in such

Calaveras County Mines.

We had a conversation this week with Mr. T. R. Andrews, of Vallejo, Calaveras Co., from whom we learned some interesting items concerning the mines thereabouts. They are nearly all drifting and hydraulic claims in that part of the county, and they had a very good season till about October 1st, when the water was cut off in order to repair the ditch of the Union Ditch Co. The water comes from the north fork of the Stanislaus river, and the company supplies nearly the whole southern part of the county. The water is sold for seven cents per inch of 24 hours. This is rather high, the Tuolumne Ditch Co., in Tuolumne county, charging but four cents.

The Dogtown Mines

Are about two miles below Angels, the town of Dogtown being a small mining camp. The Monarch mine is the old Garibaldi, which was sold for \$40,000 to the present owner. They are drifting at a depth of 130 or 140 ft. They drift out a depth of 10 or 12 ft., and the mine pays very largely; some say in places, as high as five dollars and six dollars a carload. The "Bully-Bully," on the same lead, is also a rich mine of the same character. It is owned by Carlsy & Co.

There is a good deal of cement in this gravel, and it cannot be washed till prepared. It is drifted out and hoisted to the surfices, and spread out till it dries. Then water is squirted over it, and it is left from six weeks to two months. After that it can be washed in the ordinary way.

The Keefer hydraulic claim is near by on the same channel. They have a large ditch and a new flume to carry 3,000 inches of water. They have spent a great deal of money in getting the claim opened, and it is only now partly arranged. They have a bank 80 or 100 ft. high, and the width of the channel to wash out. The mine is expected to be a very profitable one when fully under way.

Around Angels Camp

Times are lively again, and a good many arastras are at work. Some 200 or 300 men are working and prospecting thereabouts. Carlo Bros. have a large ledge of sulphureted ore. They ship it to the mill company at Murphy's. This mill is owned by a Boston company, and was put up last summer. They have large roasting and chlorinating works, and work by what is known as the Blaisdell & Morris process. In the

Vicinity of Murphy's

New mining properties are being opened every week, and times are pretty lively. The presence of the mill has been a great incentive to men to prospect for quartz, for the mill company will buy this ore from the miners. The mill company also owns several good properties itself. Their interests are all confined to quartz. There are good hydraulic mines there formerly worked, but they never had a good water supply. The flume blew down some four years ago, and there has been no water supply since. In the big red hill, where the mines were worked, there are large holders. These fall out, encumber the ground, and have to be blasted out of the way. The mines of

Douglas Flat and Vallejo

Are within a few miles of each other. They are principally gravel. Lack of capital has prevented their being worked to any extent. Mr. Andrews says there are miles of ancient river channel from 130 to 200 ft. deep, that never have been opened, but the gravel of which is supposed to be enormously rich. It is really, he tells us, a good field for capital, one of the best in California. Everywhere the channels have been opened, they have paid well.

The Moffat & Barnes drift claim at Vallejo is paying well, and this is the only mine that is being worked there now. The other mines would pay. They need money, however, to put up machinery and outfit their claims. The mines in the vicinity are all worked by drifting. To get fall to hydraulic would cost more than the miners can afford, though capital could accomplish the object.

In the deep channels, they have generally to slack the gravel; that is, where the gravel is cemented. In these claims, however, they can wash up at any time.

There are several hundred men about Douglas Flat and Vallejo "coyoting" about, but all making a living.

HOISTING WORKS BURNED.—News comes from Eureka that the hoisting works of the Wales Con. mining company have been burned. There was but trifling damage done in the shaft or underground workings. The building was 54x42 in size. About 50 cords of wood also burned. The heavy timbers in the building were expensive, being principally of Oregon pine. The loss is estimated at nearly \$10,000. Superintendent Griffith says that the works will be reconstructed at an early day, the condition of the mine fully warranting it. The night shift had gone below but a short time previous, and had it not been for the tunnel and windlass erected on that level, in all probability all those under ground would have been suffocated. The cause of the fire is supposed to have been purely accidental. It originated in the blacksmith shop, and the forge had been

Information About Mines.

For many years we have been dependent on the efforts of Wells, Fargo & Co.'s express—through John J. Valentine, its manager—for our report of bullion product for the Pacific coast States and Territories. The United States Mining Commissioner—at first J. Ross Browne, and afterwards R. W. Raymond—collected statistics of this character, also, but they usually appeared a year or two after collection, so were not of the value they should have been. It was worthy of note that Mr. Raymond's reports never agreed with Mr. Valentine's, and Mr. Raymond, naturally enough, always argued that his figures were the correct ones. People on this coast, however, based their calculations on Mr. Valentine's figures, for the reason they came out on the first of each year, at a time when we wanted to see them. Moreover, they are published in the newspapers, while the Commissioner's figures were published in his official report, of which perhaps about 50 copies found their way each year to this coast. The rest were carried off by Congressmen and turned into waste paper eventually.

Mr. Valentine, in publishing his tables on the first of each January, had to approximate receipts for the last two or three weeks of each year, in all probability. And, as he always acknowledged, added a certain percentage to the known figures, for an allowance on the bullion carried by individuals and other conveyances than his company. Therefore his figures, while answering all practical purposes, are, to a certain extent, approximations.

The office of U. S. Mining Commissioner was abolished some time since. It never was a successful office, simply because it never received proper support from Congress. The Commissioner was hampered from lack of means. He could not employ a good staff of assistants, and had to depend greatly on voluntary contributions to his report. Congress thought about \$5,000 a year was all that the Government could afford for the mining interests of the country. The Commissioner, therefore, could never do what he no doubt would have liked to do in the way of preparing useful and valuable reports.

After the abolition of the office of Mining Commissioner, his duties were transferred to the Director of the Mint, which official now collects the statistics of bullion production, etc. A call at the Mint, and conversation with Mr. A. W. Lawver, who is attending to the detail of the matter for this coast, developed several facts of interest. When they first went to work they found great difficulty in ascertaining sources of information. That is, they did not know where the mines were or who owned them. It became necessary to take active steps in getting information together to find sources of production. They first sent to Postmasters, superintendents, experts, Registers of Land Offices, etc., in each county, circulars asking them to send the names of superintendents or mine owners. These men were then addressed and asked the value of the products of their mines for the first six months in the year.

The figures resulting from these inquiries will be made public in a few days, as soon as the report of the Director of the Mint comes to hand. They will cover the period of the fiscal year ending June 30, 1880. They have obtained the information not only from mine and mine owners, but also from mills, assay offices, Wells, Fargo & Co., etc. They have a record of the shipments of crude bullion and ore over all the Western railroads for the fiscal year.

Of course the amount produced by each mine is not to be made public, but all the grand totals of counties, districts, States, etc.

These figures will be very accurate, as may be imagined from the way they have been collected, and no pains have been spared to have them complete and full. Mr. H. L. Dodge, the Superintendent of the Mint here, has a certain district in which he collects statistics, and the rest of the territory of the U. S. is divided up among other Mint Superintendents. Mr. A. M. Lawver, who attends to the details here has shown much intelligence and energy in his work, and has really accomplished a great deal in the comparatively short time he has been at work. A very large number of inquiries have had to be made and a great deal of work has been done. On the first of January, circulars will be sent to all superintendents requesting information of the bullion production of their mines from June 30, 1880 to January 1, 1881. A stamped and addressed envelope will be enclosed with the blanks so all that will have to be done is to fill out the blanks. It is to be hoped that all mine owners and Superintendents will comply with the request. The figures are not made public.

KENTUCK ELECTION.—At the annual election of the Kentucky M. Co., on the 24th ult., the following were elected Trustees for the ensuing year: T. L. Lyon, C. C. Stevenson, Wales L. Palmer, D. Bohen and George T. Marye, Jr. The Board subsequently organized by the election of George T. Marye, Jr., President, and T. L. Lyons Vice-President. C. C. Stevenson, of Gold Hill, was appointed Superintendent, A. C. Stuart Secretary, and the Nevada Bank Treasurer. The new management has reduced

Our Coast Ship-Building Interests.

We are provided on this coast with as fine ship-building timber as there is in the world. And it is not only fine but it is abundant and easily accessible. Still our ship-building interests, like those of this nation at large, are by no means what they should be. Our work has been confined principally to coasters, and vessels for the inland and Mexican trade. They have been mainly fore-and-aft vessels, though some square-riggers have also been built. These have not been in the proportion we could have hoped; but what we have built have proven able, fast and strong. Sailing vessels are slowly but gradually disappearing from the seas. Big steamers of four, five, six or eight thousand tons are doing all the work. They carry the same proportion of freight with less men, make quick and sure passages, load and discharge rapidly, turn out their cargoes in good order, and the consequence is that wherever they are put on, the sailing vessel is forced to leave. It is only on the very long-voyage routes that the sailing vessel has any chance of competing; or, in fact, has any chance of doing anything at all. On this coast, as elsewhere, these conditions are felt. At all the numerous coast ports on the California, Oregon and Washington line, and up to British Columbia, where formerly sailing vessels did the trade, the steamers now call. Fine steamers, carrying both freight and passengers, make trips as regularly as clock-work, carrying off material as fast as produced, and force the sailers to discontinue. Our coasting fleet has therefore decreased in numbers. All there is left of them is the lumber and coal trade. There is now talk of steam colliers, which will take even that work from the few employed in it, since more steamers will no doubt follow this one now being fitted up.

Our bay fleet of schooners, formerly numbering into hundreds, and carrying grain down to deep-water vessels, have nearly all disappeared. The railroads have driven them away. Steam-tugs, towing barges which carry a dozen or two schooner loads, do what water work there is. Half a dozen men, with a tug and barges, look out for what, under the schooner system, called for about a hundred men; since the wheat towed by one tug would load twenty or more schooners. A few schooners still run to small landings on the bay shore and up the sloughs, but there is not now one where there was formerly ten. With our coasting and bay trade done by steam the sailing vessels had, of course, to go to the wall. All the new vessels built have been for the inland or Mexican trade, or for lumber-carrying.

The lumber droghers built on the coast are first-class vessels. They are given plenty of shear, and are made to carry enormous deck-loads, some of them carrying two-thirds of the load on deck, only one-third being in the hold. They are loaded down to the deck, the rail and ends only being out of water. Still very few accidents occur from this apparent overloading. A question for our serious consideration is how can we foster our ship-building interests on this coast? How can we advance them? The annual report of the Register of the Treasury states that the total tonnage of the country exhibits a decrease of 101,566 tons. The enrolled tonnage has increased 37,751 tons, while the registered tonnage has decreased 138,723 tons. Referring to ship-building, the Register shows that during the past year the amount of building has been less by 35,620 tons than the preceding year. These figures, of course, refer to the condition of the industry in the nation at large.

The new sailing vessels are all iron ones; the new steamers are all iron ones. They have even begun to build, in New York, several iron passenger steamers for inland waters. The new steamers recently brought to this coast, for coasting trade, by the two companies in that business, are iron. It is plainly forecast that the days of wooden ships are numbered. Steam whaling vessels are found to be superior to the old style of vessels, and several are being built to take the place of old barks. The steamers will drive the sailers from that trade. The iron vessels are found to be better in the long run, all things being considered, than the wooden. Therefore the wooden vessel must disappear.

Our coast ship-building interests, like those of the nation, are languishing, and we can really see, under existing circumstances, no way of building them up beyond their present extent, unless we start in to build iron ships, or, at least, composite ones. It is evident that to compete with other nations on the high seas, the Americans must build iron ships. On the Eastern coast they build a few iron steamers; we say few, as compared with European shipyards. On the Pacific coast we build none, as yet, but we hope to see the day when this industry will be inaugurated among us. Still, it must be confessed if it does not pay to build iron sailing vessels in the East, with cheap iron and coal, it is useless for us to attempt it at present here. We should like to hear from some one having experience in iron shipbuilding, so as to ventilate the subject more fully.

The Battle Mountain Messenger predicts that the Nevada Southern road will be open for travel on the 1st of June, 1881, and says: The building of this road is only a starter of which will be a continuous line of rails from Battle Mountain to the Colorado river, and will be the means of opening up an immense field of good mineral country.

The Coal Cruelty.

We do not profess to know all the ins and outs of the coal business, but it seems plain that those who assume the responsibility of providing for the comfort of the people, as coal importers and coal dealers, have been either cruelly negligent of their duty or else criminally cruel in their business policies. It is stated in behalf of the coal dealers that there is no combination to restrict supplies and advance prices, but that the scarcity came without design and that the high prices are consequently unavoidable. Now, while poor people are shivering and eating cold or half-cooked food; while the little ones are being hunted down by death in the damp houses, and adults are contracting the many diseases which spring from exposure, it is perhaps not worth while to split hairs about the exact cause of the present cruel coal famine. In any way we can look at it the coal dealers are to blame. They can calculate quite accurately the consumption of coal, and it is their duty to the public to mix enough humbug with their greed to take measures to secure a good supply to meet the consumption. Ordinary business sense would order them to do this, and, as coal is abundant at the mines and there has been no general sinking of ships, we do not see that there is any excuse for not having

Attaching Bullion in Transit.

The Reno Gazette tells of a case that will determine a doubtful question, as follows:

"Have you two sacks of bullion here from the Arizona mill and mining company of Unionville?" asked deputy sheriff L. Chamberlain, as he swung himself into the express car on the west-bound train at the depot here last Saturday night. The messenger knew Chamberlain and tried to convince him that there was no such bullion in the car; but the officer grabbed the way-bill and saw that it mentioned the bullion he was in search of. He then showed a writ of attachment.

"Well," said the messenger, "you can't have it anyhow. You can't take any thing in cars of the express company."

Chamberlain said he could. He found the bags and took them. The bullion was valued at \$350. It was attached by Jerry Schooling. As the railroad and express companies claim that goods in transit are not subject to attachment, there is likely to be some litigation over the seizure to decide the point.

Another Waterfall on the Columbia.

In our issue of November 6th, we gave an engraving of La Tourelle falls on the Columbia river together with some interesting state-

MULTNOMA FALL ON THE COLUMBIA RIVER.

coal enough on hand. Of course we know that ships have been, in demand, and rates high, but there has been no advance in carriage cost commensurate with the almost prohibitory price which coal now commands. Therefore we say that the doubling of the price of a ton of coal is either the result of culpable business negligence, or something worse. If it be the result of preconcerted action among dealers not to bring so much coal here as the people need, then their action is inhuman, and if earthly tribunals do not meet such wrongs, there is an hereafter, where such outrages upon the comfort, strength, and even the life of their fellow beings will be suitably handled. We are loth to believe that the present cruel condition in coal is the result of design. It is almost too painful to think of; but whether the result of neglect or intention, it is a wrong beyond words to describe, and which those dealing in coal should never allow to occur again.

The third trial of the Idaho G. & S. M. Co. case began Monday in the Superior Court at Nevada City. The plaintiff sues the company for \$50,000 damages, on the grounds that he lost one of his legs and sustained other injuries, owing to the use of dangerous blasting powder in the mine.

AFTER two years more coquetting with various places for bonus inducements, the Sweepstakes Plow Co. have determined to remove from San Leandro to Benicia, the citizens of that town having purchased and donated to them the buildings, wharves and other property formerly used by the Pacific Mail Steamship Co.

moats concerning this mighty water course of the North. Along the same river there are many cascades, and another of them is shown on this page. It is known as Multnomah falls. The engraving is from Mr. Conklin's forthcoming book, "Picturesque Northwest," to which we have frequently alluded. The "Multnomah" falls are about 700 feet high, and divided into two sections; the upper being 500 and the lower 200 feet. The first section falls into a pool, carved from a rock, about 20 feet in diameter, filled with the finest mountain trout, and festooned with the finest maidenhair and other delicate ferns. At this pool, hemmed in by the botanists' choicest studies, from fern to mountain timbers, and protected and ornamented by rocks and boulders, a general formation of the whole producing a concave grotto in the side of the mountain, over and down which "Multnomah" chooses her leap, is a model picnic ground, where one can be scared into superstition by the echo of his own voice.

RAILROAD COMMISSION AND STEAMERS.—A friendly suit will be brought by the Railroad Commissioners of this State against the Pacific Coast steamers, to determine the power of the Commissioners to regulate rates of carriers whose lines run beyond the limits of the State. The Commissioners claim that they have that right as to freight carried from one part of the State to another, and over freight rates earned by goods in transit through the State, no matter what may be their ultimate destination.

The receipts for tolls on the canals in New York this year are \$600,000 greater than the last.

Neighborhood Improvement Associations.

The dwellers in the southeast quarter of the town of Berkely, Alameda county, have organized an "association for the promotion of neighborhood improvements." Two enthusiastic meetings have been held, simple by-laws for the guidance of the organization have been adopted and officers have been chosen.

We have upon former occasions alluded to the work of village and neighborhood improvement societies at the East, and we are glad to know that similar effort is to be put forth in this State. We trust that it will attract the attention of villagers everywhere throughout the State, and that our host of beautifully located and envied towns and hamlets will be brought into truer harmony with their surroundings by the growth of trees, the excellence of their roads and the general nestness of their highways and door-yards. In order to remind our readers of some of the directions in which village improvement may be advanced, we shall mention some of the results which the Berkeley Association aims to secure by co-operative effort. The objects of the association are to encourage and promote the improvement and ornamentation of the streets, stations and public places of the locality, by planting and cultivating shade and ornamental trees; establishing and maintaining walks; grading and draining roadways; clearing the streets, avenues and sidewalks of unsightly weeds, refuse matter and rubbish; promoting the introduction of water and its utilization for sprinkling the streets; the consideration and promotion of such a system of sewerage as may be best adapted for the sanitary condition of the town; encouraging system, order and tidiness, and generally to do such other acts as may tend to beautify and improve the neighborhood as a place of residence.

Taste and comfort alike demand that these natural advantages should be reinforced by individual effort and co-operation. This it is the design of the association to promote. A vast deal has been done wherever improvement societies have been organized, in the way of stimulating citizens to adorn their private grounds, or, at least, to keep their grounds and fences in good order, removing weeds and rubbish from the sidewalks, etc. "What most detracts from the good appearance of any village is the slovenly look which comes from badly hung gates, crooked fences, absent pickets, and general shiftlessness about private places, and it is by encouraging citizens to take a pride in attention to these details that the association will do its best work. This result may be accomplished almost entirely without the expenditure of money. It is in attention to little things, and in securing the co-operation of private owners—a co-operation which will call for an inappreciable amount of labor—that the most telling work of the society is to be done."

The first work of the Berkeley Association will be in the direction of tree planting—shade and ornamental. As a preliminary movement a committee of experienced men has been appointed to select a list of trees (chiefly deciduous), adapted to the soil and locality, and to ascertain the terms upon which they can be delivered in quantities to the association. Through it they can be furnished to private owners, or planted by contract, under the auspices of the association. It is desired that along every street and avenue (those projected as well as those opened for use), shall be planted shade trees during the present winter. If practicable, clumps of evergreen trees, for wind breaks, should be planted in needed places, under professional supervision. It is obvious that the effect of these, in a very few years, would not only add largely to the beauty of the landscape, but modify the effects of the occasional high winds. Other work will be evolved as the association grows in experience. It is proposed that the revenue of the association shall be derived from a membership fee of \$1 per annum from each person over the age of 16 years; from contributions of non-residents, in consideration of the planting and care of trees, fences, grounds, etc.; from donations and life membership fees from public spirited individuals.

We trust, as we have said before, the pioneer effort at Berkeley will be emulated in all parts of the State. In the hope that there may be such a disposition to organize we will soon give the simple articles of association, and by-laws adopted by the Berkeley society, in case they may be suggestive to those who desire to begin similar work. The main point in organizing village improvement societies is to enlist the active support of every resident in the community, and especially the active co-operation of the ladies. Colonel Waring, an enthusiast on the subject, in a little book on Village Improvement Associations, from which we have already quoted, says: "It requires the sort of systematic attention to details, especially in the constantly recurring duty of 'cleaning up' that grows more naturally out of the habit of good housekeeping than out of any occupation to which men are accustomed."

A SPECIAL train taking Col. Geo. E. Gray, chief engineer of the Southern Pacific railroad, and a party of other C. P. officers, to San Francisco, met with a serious accident fifteen miles east of Yuma, Monday. The engine jumped the track and was ditched, the baggage-car being thrown across the rails. The only person injured was Bruce, the engineer, who had a leg broken and sustained other injuries.

Improvement in Mine Cars.

An ingenious arrangement for a constant automatic lubrication, and also for giving more freedom of action to the wheels of colliery tubs, etc., has just been devised by Mr. James Reilly, of the Globe Mahogany Chair Works, Pomona Gardens, Manchester. Colliery tubs as now generally constructed simply rest upon open bearings, which have to be constantly re-oiled, and being exposed to the dirt and dust quickly become clogged, which necessarily not only interferes with the free action of the wheels, but greatly adds to the wear and tear upon the bearings. Mr. Reilly's invention does away with all these disadvantages and may be briefly described as follows: In the first place, the wheels run loose upon the shaft or axle-tree, instead of being fixed as at present, and the boss of the wheel is so constructed as to form an oil box containing a sufficient quantity of oil, which is supplied from the outside, to continually lubricate the wheels for months without replacing. The outside of the boss, which has a solid end, is recessed beyond the end of the bearing to the extent of three-quarters of an inch, to contain oil, whilst the inner portion of the boss is bored through on the outer rim, and these bores, which also contain oil, communicate with a groove in the center of the boss, which passes the oil on to the bearings. These apertures to the oil box from the inside portion of the boss are tightly closed up by means of turned collars bolted over the holes, and as the outer portion of the boss, as already stated, is solid, it will be seen that the oil box is perfectly closed up from dirt and dust, in fact nothing can get near it, and it is left free to act constantly upon the bearings through the flange in the center of the boss. A further advantage is secured by the wheels being fitted loose on the axle-tree, and allowed free action inside the boss. The tub, by the independent play of each wheel thus secured, can be turned readily in any direction, and round the sharpest curve without the assistance of a turn-table; indeed, such is the freedom of motion that a pair of wheels on a level surface will describe without difficulty a complete circle or even a figure eight. Mr. Reilly also intends attaching to his patent wheels a counting indicator, which will record every time the tub has been tipped, and thus afford an effective check against the weighman on the pit bank.

PUBLIC LAND DECISIONS.—A Washington dispatch says: The Secretary of the Interior rendered a decision of wide application and large importance, in the matter of the adjustment of the California School Land Grant, as regards indemnity selections certified prior to March 1st, 1877. In this decision Secretary Schurz holds that only defective or invalid selections, made in lieu of actual losses or deficiencies, and selections made in lieu of 16th or 36th sections, alleged by the State at the time of selection, to be lost in Mexican grants, but which since March 1st, 1877, have been, or may hereafter be, found upon the final surveys of such grants, or by approved public surveys, not to be so lost to the State, are confirmed by the Act of March 1st, 1877, commonly known in California as the Booth bill; that no more than one section (the first one) is confirmed in lieu of the designated loss or deficiency; that no selection is confirmed which was made in lieu of a 16th or 36th section, shown by survey at the time of selection to be in place or in lieu of a 16th or 36th section, which by final survey of a Mexican grant or approved public surveys, was ascertained prior to March, 1847, not to be lost to the State, the State in such cases taking the 16th or 36th section, and the United States the selected land, to be disposed of to a purchaser of the State, or in case no State purchaser claims it, then to be disposed of as other public lands. The Secretary also holds that in no case can the State take the 16th or 36th sections, and the lands selected in lieu thereof; hence, that unless 16th or 36th sections, in lieu of which other lands have been illegally selected and certified, revert to the United States under said Act (which cannot be the case where the 16th and 36th sections were ascertained to be in place by surveys returned prior to March 1st, 1877), the selections are not confirmed, and the selected lands are held for disposal under the provisions to the second section of the act, as are all other selected lands, the selection of which shall be found to fail, and not to be confirmed by said act.

THEY HAVE STRUCK IT.—There has always been very rich float rock found about two miles west of Carlisle and one mile west of Old Man Mountain in Meadow Lake mining district. This rock has paid by assay over \$100 per ton as it was picked up on the surface. The ledge from which this float rock came has never been discovered, although it has been searched for by many parties. Recently, James Gould, the man who introduced the process of working Meadow Lake ores, and Geo. W. Giffen, commenced a search for the ledge, and after about two month's work, they struck a formation which they think is the right one. It is about five ft. between walls, is well defined, and the vein matter is composed of clay, quartz and porphyry, and being in the right locality, they firmly believe it is what they have been searching for. Both gentlemen being good democrats, came into town on Sunday to remain till after election, when they will return and resume work on their find.—*Truckee*

WANTED!
SITUATION as ASSAYER

By a young man who thoroughly understands assaying all kinds of ores. A graduate of Kustel & Rietto, to whom he refers. Address his father,

F. HOFLING, Jewelry Store, No. 5 Third St., S. F.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations and can be used to crush and mix in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloriding Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply. Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 500 pounds for Gold and Silver Ores, Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warehouses, 92 and 94 Liberty St., N. Y.

GOLD SAVING
SILVER PLATED
Amalgamating Plates,
FOR QUARTZ MILLS AND GRAVEL CLAIMS.

ALSO, CHALLENGE SWINGIN PLATES,

For use in Sluices for Saving **FLOAT GOLD.** Constantly on hand **PLATES** of various sizes; are prepared to fill orders on short notice. Old Copper Plates Purchased. Replated or Old Plates. Copper and remove the Gold at a very small expense.

California Inventors

Should consult **DEWEY & CO.,** AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1830. Their long experience as Journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 202 Sansome St., San Francisco.

INGERSOLL

Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Coast.

GEO. R. FOARD, GEN'L AGENT,
No. 18, First St., S. F.

INCERSOLL

ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:

Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the **CALIFORNIA ARCHITECT AND BUILDING REVIEW** will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Hendrickson

A NEW BOOK.

A Treatise on the Horse and his Diseases.

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines.

Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year.

It is printed on fine paper and has nearly 100 pages, 7 1/2 inches. Price only 25 cents, or 5 for \$1, on receipt of which we will send by mail to any address.

Scientific and Practical Books
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1887.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 155 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$3.00, colu, postage free.

DODGE'S

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Holly vs. Vergennes Machine Co.
U. S. Circuit Court, District of Vermont. Decided October term, 1880. Wheeler, J.

1. The meaning of a claim in a patent is to be derived from the specification.
2. Two devices are substantially the same in the sense of the law of patents, when they perform the same functions in substantially the same way to accomplish the same result, and except when form is the essence of the invention, it should not be regarded in the question of infringement.
3. In determining the matter of infringement, attention should be paid to such portions as really do the work, so as not to give undue importance to parts used only as a convenient mode of construction.
4. The patentee is entitled to the exclusive use of the whole of this patented invention, and if it is a combination of numerous parts, including in it other new and useful combinations of some of the parts, he seems to be entitled to the exclusive use of these lesser combinations, as well as the exclusive use of the whole.

The National Car Brake Shoe Co. vs. The Lake Shore and Michigan Southern R. R. Co., and Same vs. Illinois Cen. R. R. Co.
U. S. Circuit Court, Northern District of Illinois. Decided October 26, 1880. Drummond, J.:

1. Effect must be given to the whole of the description contained in the specification and drawings of a patent. Hence, if it can be ascertained that a patentee intended to divide his invention into two parts, and to describe and claim them as separate improvements, the patent must be construed according to this intention, so as to give full effect to each part of the invention.
2. When a patent claims, first, a combination of two parts, so arranged, that one can have a "lateral rocking motion" on the other, and, secondly, a combination of the same parts with two additional elements, "the whole being constructed and arranged substantially as specified," but not in terms referring to the rocking motion, and second claim is infringed by the use of its combination of mechanism, although the arrangement is such as not to permit any rocking motion.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

A Trip Down the Coast.

EDITORS PRESS:—Never did the Pacific Coast Steamship Company carry a hungrier set of passengers than that which left San Francisco on the *Oriaba* on the 14th inst. The sun shone brightly and set grandly; the sea was calm—for much of the distance as calm as though oil had been poured upon its surface, and all the passengers, children included, took their meals with a regularity which must have distressed the waiters.

Besides the usual assortment of San Franciscans on a cruise southward, the company included two families from East of the Rocky Mountains, both bound for San Diego, where they intend to locate, and also one or two unencumbered gentlemen *en route* for the same place. For in the East it is firmly believed that this time the railroad is coming to San Diego, and no mistake. On the faith of promises made by the new competitor for Californian trade these families have left their homes, to seek in the balmy climate of southern California health and a livelihood. Other families have preceded them; others still are coming.

These new-comers do not doubt, like the average San Franciscan, the possibility of a prosperous future for San Diego; and, after conversations held with them and others, the writer is convinced that this time it is no flash in the pan, no momentary *furor*, but a real railway which will be carried through, and which will be a formidable rival to the Central and Southern Pacific. But the people of San Francisco need not fear that the prosperity of San Diego will interfere with that of their sand-hill city. Even if the harbor of San Diego, with its narrow entrance, could compare with the grand bay of San Francisco in accommodation for vessels, the railway to it will, after all, be only a branch, the main line running up to and terminating at the present commercial capital. This, at any rate, is the intention and the route marked upon the maps shows the line as passing Santa Barbara—whereat the good people of this place are exceedingly jubilant, and prophesy unto themselves all manner of good things. At sunrise on the 15th we were at the wharf.

At Port Harford,

Where we disembarked, a considerable proportion, both of passengers and freight. There had been a landslide at the entrance of the tunnel

nel through which the railway from San Luis Obispo, which is about nine miles distant, finds its way to the sea shore, so that those bound for that place had to walk some distance. The tide was up, the cliffs were high, the general aspect of this shore, like that of the hills facing the northern side of the Golden Gate, was bare and brown, but I was assured there was much good country back of these hills, and that the mesa or terrace to the south bore potatoes and fed sheep. At Port Harford the steamer's head was turned northwest, lying almost parallel with the shore, which here curves so as to afford protection against all storms coming from the north or northwest. The automatic buoy scarcely made a sound as we passed it, so nearly waveless was the ocean. Between Port Harford and Point Sal most of the coast is a broad terrace, containing much good farming land, but fronted along much of its length by extensive sand-dunes. We were told that large quantities of grain were awaiting shipment at Point Sal, and from the deck could trace by the clouds of dust they raised on their passage, the progress of the wagons that were bringing still more down the rough mountain road. The wharf at this point was destroyed in the past winter, and has just been rebuilt. Beyond Point Sal is the Lompoc country, which is accommodated with a good wharf. We could see the wharf, but not the beams which a waggish native of the locality told us to look for. Now we approach

Point Concepcion.

The Cape Horn of California, the boundary below which only a very small proportion of the northern marine fauna passes, and north of which only a remnant of the southern fauna ventures as far as Monterey bay. Point Concepcion runs out into the sea farther than most of the capes of Alta California, and is backed by an extensive mesa. At its extremity it rises into a rugged and precipitous, but not very lofty cliff, on the summit of which the lighthouse is perched. This point, as is remarked by Prof. Davidson, is one of the most striking examples of the terrace formation to be found upon the coast, and at the same time one which most bears out the theory of the glacial origin of those terraces. It seems as though the ice sheet, as it passed along the coast, grinding down the lower foothills, wherever they interfered with its progress, to a level surface, irrespective of their stratification, was at this far-projecting point too narrow to reach to the extremity, which was thus left above the level of the country behind it.

Immediately after turning the point, we reached the bed of kelp which continues southward along the coast, its inner edge near low-water mark, its outer in 10 fathoms or thereabouts. Into this kelp, and as close as we could in shore, we steamed, in order to put ashore the well-known extensive land and cattle owner, Patrick Murphy. Looking over the side of the vessel, as we drifted with the tide, we could see the long streamers of sea weed floating for some 60 or 80 ft. from the point where they first came near enough to the surface to be visible. Eastward our course lay now, and soon it became northward as we approached

Santa Barbara.

I shall never forget the beauty of the scene. In the bright moonlight, nestled among trees at the foot of the Santa Inez mountains, with lower hills to the right and left, Santa Barbara looked indeed a place at which one would be content to live. Nor is the spot less charming in the daytime, though the Santa Inez mountains show less near, and the intervening foothills come into view. The trim gardens, neat, and often handsome residences, and clean streets, joined to its position in a valley between two ranges of low hills, all combine to give it an aspect more pleasant than that of any of the more northern towns of the State, except, perhaps, Santa Cruz and San Rafael. Yet a nearer acquaintance with the flora of the hills and valleys is disappointing to one accustomed to the wooded country around Mt. Tamalpais, although it might please an Oaklander. The only tree upon the lower hills is the live oak (*Quercus agrifolia*), and the valleys add only the eucalyptus, willow, and a few ceanothus bushes. No madroña, with its glossy leaves and smooth, velvety bark; no hazy tree (except in the gulches) towering above the oaks; no chestnut oak, no ash, no maple, nor, at least in all the lowlands from Santa Barbara to Rincon, any kind of pine, spruce, fir, or redwood. The black and red oaks grow in more elevated localities, but even there there is none of that variety of foliage which gives so great a charm to the wooded regions of Marin county.

But man has done, in every sheltered spot, what nature failed to do, and his gardens and plantations give a semi-tropical aspect to the more cultivated portions of the country.

Groves of Oranges and Olives.

Hedges of limes, date palms, fan palms and bananas, fig trees and guavas, and fields of pampas grass grow side by side with the more familiar pumpkin and apple. The date palm, to my mind not pleasing when old, is a very graceful object when young; its long, feathery leaves rising from near the ground, and arching downward at their tips. The guava is not planted, like Mark Twain's pumpkin, for a shade tree, but for use. The fruit is preserved, and guava jelly is made. There is a fruit cannery on State street, and I am told it is kept busy.

The olive and the orange are planted extensively, and are at present in a flourishing condition, but their fruitfulness is menaced by the scale bug or coccus, which is becoming abundant. I was shown two encies in Mr. Bingham's plan-

tation at Montecito; one living upon both olive and orange, the other apparently on the orange only. This first is black, rather large, about a sixth of an inch in length, and lives principally upon the branches and in the axils of leaves and twigs. The other is much smaller, and lives upon the upper side of leaves, especially affecting the midrib. All the examples I saw of the black kind were old and dried scales, but the other kind were in various stages of growth, and in great abundance upon the trees infested by them. Many of the leaves on the oranges where this coccus was plentiful were covered on their upper surfaces with a black substance, looking much like a fungoid growth; which, however, it could scarcely be, as it was readily brushed off, leaving the surface of the leaf apparently uninjured. The idea that it had any relation to the coccus so often found with it, was weakened by the occurrence of the insect on leaves whose upper surface showed, to the naked eye, no traces of the black substance.

In and around Santa Barbara, as in and around San Francisco, and everywhere else in California where he makes his home, modern man has planted the blue gum and the pepper, the latter of which thrives vastly here, increasing to a tree some 50 ft. in height, and the equal of the native oaks and sycamores.

At this Season

One of the most conspicuous features in the fields is the quantity of pumpkins that lie ripening in the sun. Many of these are of great size. Mr. Shepherd had one that weighed 220 lbs., and examples as big as a beer keg are common. Flax is fast becoming a staple crop in this neighborhood, but is now all harvested, so that all that is visible of it is the straw, much of which is thrown into the roads in sandy places to make good. One man near Santa Barbara had some 900 sacks of flax seed. But the crop that predominates all along the coast from Montecito to Carpinteria and Rincon is the Lima bean. As a boy remarked, the people are crazy for it. Now is the bean harvest, and the processes of carrying, threshing and winnowing are being actively carried on, the two latter out of doors, as well as the first. The usual method of threshing is very primitive, being nothing more than that so often hinted at in scripture. If, in the phrase "the ox that treadeth out the corn," horse was substituted for ox, it would apply to this neighborhood. Steam threshing, they say, don't pay, so they drive a band of horses and colts into a corral, previously strewn with a layer of beans, and whip the animals around, varying the operation occasionally by driving round with a wagon and span of horses. A large proportion of the crop must necessarily be lost by such a method as this, yet the crop is a profitable one in a season like the present.

Last year was a bad one, but this year has brought amends in full crops of everything, from flax, beans and pumpkins to figs and pampas grass, which last is grown in large quantities, the long, white plumes finding a ready market in the Eastern States. Other fruits grown here in considerable quantities, are the almond and the walnut. The latter succeeds well as a fruit-bearer as far south as Los Angeles, but even at Santa Barbara shows its disgust at the warmth of the climate by remaining a large hush, instead of growing into a splendid tree, as it does in England.

It must not be supposed that figs, palms, oranges, and such like semi-tropical fruits will grow anywhere, even in this mild climate. They need shelter and water, two things only obtainable in certain favorable situations throughout all southern California. Most of the best places here are already taken, yet there is still room and new people are still planting. One man is going to plant out 5,000 oranges this year; another will plant 25 acres with the same fruit.

The country available either for agriculture or pasture around Santa Barbara is of limited extent. Successive ranges of low hills, coming down from the mountains to the sea, part the coast country into a series of sheltered valleys. Santa Barbara occupies one of these, and thence eastward succeed Montecito and Carpinteria, the further extremity of which is known as Rincon, a word which is simply Spanish for a corner or internal angle. Westward, toward Point Concepcion, the structure of the country is similar. A noticeable feature of many of the spurs given out by the mountains between Santa Barbara and Point Concepcion is their termination in a hill higher than the range behind it. The carving of these ridges has been done by ice; we can imagine how the ice sheet, descending from the heights above, swept over the upper portions of the foothills, but failed to overwhelm the extremities of the spurs, leaving them as monuments to be rounded off by the rain and the weather. Back of all these valleys stretches a vast waste of mountain country, the interlacement of the Coast and Sierra ranges.

Santa Barbara is dull just now. The continuance of fine weather retains in San Francisco many of those people in delicate health, but with fall pockets, who are accustomed to make this place their winter home. One wonders what the people find to do, but the same air of dullness pervades all watering-places out of season. Let us hope the Barbareños will have a good one when it comes.

W. N. LOCKINGTON.

Santa Barbara, Nov. 20, 1880.

THE Homestake dividend of \$30,000 regular and \$30,000 extra was paid in New York last week.

News in Brief.

THE typhoid fever is epidemic in Grass Valley.

THE total four per cent. bonds registered is \$528,100,950.

THE Montensgrins are to occupy Dulcigno with 40,000 men.

THERE are 20,000 cords of wood piled in the outskirts of Bodie.

THE recent severe weather damaged the cotton crop 500,000 bales.

THE skating is now excellent in many places along the Carson river.

IMPORTANT discoveries in gold placer diggings are reported from Alaska.

GROUND has been broken for the new railroad shops at West Oakland.

THE ship building of the country declined 101,566 tons during the past year.

THE outbreak of a horrible war with fearful huthery is reported at New Calabaria.

THE total vote in the Presidential election was 9,192,595. Garfield's plurality, 3,401.

DE LESSEPS says that everything is ready to commence work on the Panama canal.

THE ministers of St. Louis have decided to bring suits for a violation of the Sunday law.

WORK on the Oregon railroad is vigorously progressing, over 200 graders being employed.

J. W. MORSE has been appointed General Passenger Agent of the Union Pacific Railroad.

IN the fighting at Dulcigno, the Turks lost 300 killed and wounded, and the Albanians 400.

HANLON and LAYCOCK, the oarsmen, have been matched for a race on the Thames, January 17th.

KHYBER PASS, the sole remaining fruit of the British campaign in northern Afghanistan, is about to be evacuated.

FRANCIS HOTCHKISS died suddenly at New Haven, Conn., Monday, and his wife, on hearing the fact, fell dead.

THE control of the Missouri, Kansas and Texas Railway Co. is to pass into the hands of the Missouri Pacific Co.

GEORGE W. WILLIAMS, a negro member of the Ohio Legislature, is organizing a gigantic exodus of blacks to New Mexico.

THE President has issued a proclamation this week, declaring that Chinese vessels are not subject to any discriminating duties.

THE chief of the geological survey in western New Mexico reports the discovery of a prehistoric city 40 miles from Santa Fe.

THE Secretary of the Navy has approved the course of Commissioner Hughes, relative to the captain of the British steamship Sandrigham.

THE volcano of Mauna Loa, on the island of Hawaii, is in active eruption again. Rivers of lava 30 to 50 miles long are flowing down its sides.

THE steamer *Simcoe* foundered in Lake Michigan on November 24th. The captain and 11 of the crew perished. Five succeeded in reaching land.

DESPITE the energetic remonstrance of the representatives of European powers and of the United States, the persecution of the Jews continues in Morocco.

THE Ute Commissioners have gone to Loe Pine to pay the Uncompahgre Utes \$25,000, being their portion of the \$75,000 paid to the Utes under the treaty.

ON the 24th, a party of miners going from Georgetown, Colorado, to the North Park, were precipitated in an immense snow drift, and two of them were killed.

THERE is now about \$85,000,000 in gold bullion in the United States Treasury, of which it has been decided to coin monthly \$10,000,000 of the denomination of \$5 and \$10.

POURPARLERS are passing between the United States and the French and German Governments for exchanging opinions relative to the employment of the existing silver coins.

GEN. WALKER, Superintendent of the Census, characterizes as entirely erroneous, the recently published statement that the money for the census of Indians has given out and that the work is a failure.

THE track of the Southern Pacific railroad is now laid 18 miles east of the Rio Mimbras. Track-laying has moved slowly the past few days, owing to the scarcity of rails, but a supply has gone forward.

THE Bessemer Steel Works, the Albany and Rensselaer Spike Mill and Burden's Water Mill of Troy, N. Y., shut down last week on account of low water; 1,000 men are thrown out of employment.

ROBERT, son of President Lincoln, received the most votes on the electoral ticket in Illinois.

THE Union Pacific Railroad Company has reduced the passage rates from Omaha to Ogden from 7½ cents per mile to 6.

A FIRE occurred at West Point Sunday night, which destroyed the extensive wharves and sheds of the Richmond, York River and Chesapeake Railroad Co. and the company's steamer *Shirley*; also the telegraph and freight offices and all freight on the wharves, including 2,600 bales of cotton. The loss is estimated at \$350,000. Insured.

TELEGRAMS from Berlin inform the State Department that the cases of American naturalized citizens, who have been arrested in Alsace and Lorraine on charges of owing military service, have been decided in accordance with the claims of the government. The release of Weil has been already reported, and now it is announced in his case, as well as in the previous one of Getres, that all fines and penalties imposed by the German Government have been remitted.

Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and either of them incline it to shed prematurely. **AYER'S HAIR VIGOR** will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and blemishes. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on harsh, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of tone it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

Australian Patents.

The attention of Pacific Coast Inventors is called to the benefits which may be derived from Letters Patent of the Australian Colonies. We invite correspondence from all who may desire full information on the subject. The geographical location of San Francisco gives an advantage in our favor over Eastern agencies, rendering it possible for us to transact business in much less time. Send for our circular giving full information regarding Patents for the following countries: Victoria, New South Wales, Queensland, South Australia, Tasmania, New Zealand, East India, Etc., Etc.

DEWEY & CO.,

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & Co.'s MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOTH VOLUMES OF THE PRESS.—We have a few sets of the backfiles of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

Chew JACKSON'S BEST Sweet Navy Tobacco

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

SAN FRANCISCO, DECEMBER 1, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, Dividend No. Twenty-two (22) of Seventy-five (75) Cents per share, was declared payable on Monday, December Thirteenth (13), 1880, at the office in this city, or at the agency of the Nevada Bank of San Francisco in New York.

WM. WILLIS, Secy.

Office—Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

Alpha Hydraulic Gravel Mining Company.—Principal place of business, San Francisco, Cal.

Location of works, Alpha Hill, Nevada County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the Nineteenth (19) day of November, 1880, an assessment, (No. 2) of Twenty (20) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. gold and silver coin, to the Secretary, at the office of said company.
Any stock upon which this assessment shall remain unpaid on the Twenty-fourth (24) day of December, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
JAMES IRELAND, Secy.
Office, No. 215 Sansome Street, San Francisco.

Land Purchasers Association.—Location of place of business, San Francisco, California.
Notice is hereby given that at a meeting of the Directors, held on the Ninth (9) day of November, 1880, an assessment of Five Dollars (\$5.00) per share (being a part of the 4th installment on the subscription to the stock), was levied upon the capital stock of this Association, payable immediately to the Secretary, at 315 Montgomery Street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid, on Friday, the Tenth (10) day of December, 1880, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
C. S. WRIGHT, Secy.
N. B.—This assessment is to pay the taxes on the property of the Association for the current year.

DEWEY & CO., American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

STEIGER & KERR'S

CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

VOLUME XLI
Number 24.

Long Roasting Furnaces.

The engravings on this page represent a vertical section and ground plan of what is known as a long roasting furnace. Mr. Kustel, in his "Roasting of Gold and Silver Ores," says this kind of furnace gives great satisfaction, as there is not only a great saving of fuel effected, but also a greater quantity of ore can be roasted than with a single furnace. It is a modification of the double furnaces, and seems to be more convenient for the roasters. There are two men employed at a time, there being one ton and a half to two tons in the furnace. The hearths are either arranged horizontally, as the drawings show, or only the first one is level, the other two are inclined; this facilitates the shifting of the ore. Each hearth is 10 ft. long and 12 ft. wide. After the first hearth there is a step of four or six inches, partly to divide the first from the others, but principally to effect a better mixing of the ore. The ore is fed on the last hearth, through the sheet iron funnel, spread equally on the hearth, and, according to its dampness or the quantity of sulphurets contained, stirred more or less from one and a half to two hours. As it is not only inconvenient, but impossible, to have a good stirring effected at a distance of 12 ft., which requires long and heavy tools, there are for this reason working doors on both sides of the furnaces. The roaster uses hoes or rakes eight ft. long, and made partly of gas pipe, which are light and handy. The working doors are 30 inches wide. They must all be kept closed except when the ore is being raked, and then it is very proper to have half of the door closed (with a piece of sheet iron). Sufficient air comes in at the working door of the first hearth.

After one and a half to two hours the ore is removed to the middle hearth and spread equally over the whole surface. A new charge is introduced instead of the former. There is a higher heat on the middle hearth than on the last one. The treatment of the ore is here the same as before, being raked from time to time. After a lapse of one and a half to two hours the ore is moved again to the first hearth, in the same manner as before. The ore is now exposed to a light red heat, by which the chlorination or oxidation must be finished in the same time as on the other hearth. It is necessary to change here the ore from the bridge toward the flue, and reverse once during the roasting. When the operation is finished, the roasted ore is drawn into iron cars below the furnace, through the opening in the floor. When all the ore has been removed, the charge on the second hearth is transferred to the first, from the third to the second, and from the funnel to the third hearth, and the process continued as before, so that a thousand lbs. are drawn out every one and a half to two hours.

The bridge is 14 inches high. For the purpose of admitting air or steam, a canal can be made in it. The fire-place is 15 inches wide and 8 to 9 ft. long, and 15 inches below the top of the bridge. The ash pit is made according to what seems more convenient. A deep ash pit is more favorable for the preservation of the grates, as they are less heated. Each door is provided with an iron roller. A furnace of a similar description was in operation in La Dura (Mexico), roasting refractory silver ores for the chlorination process.

A furnace 60 ft. in length, with 6 hearths, as built by Mr. Graff at the San Marcial, had the advantage of being capable of roasting from 8 to 12 tons of ore in 24 hours, discharging every hour from 800 to 1,000 lbs., according to the

charge. In case ore is subjected to roasting which has not enough sulphur to create the required heat in burning, an additional small fire-places must be attached on one side, so as to bring the flame into the fourth hearth.

The Work of the Mints.

The diminished production of gold and silver on the Pacific coast has seriously affected both the amount of deposits and coinage at the mint in this city during the past year. The coinage at the mint was \$13,000,000 less of gold, and \$6,000,000 less of silver than in 1878. The director of the mint gives the following figures: Value of deposits during the fiscal year 1880, \$39,387,949; amount of coinage, \$36,053,000, showing a decrease as compared with the preceding year of a little more than \$4,000,000 in deposits, and almost \$6,000,000 in coinage. The value of the bullion deposited at the Carson City mint during the fiscal year 1880, was \$551,885, and the amount of coinage \$654,796.

\$289,000. The coinage of gold, although heavier than in any previous year, could not keep pace with the deposits, and \$38,468,874 gold bullion remained uncoined at the New York assay office and Philadelphia mints at the close of the fiscal year. The mints, however, augmented the circulation \$84,370,144; adding \$56,157,735 gold, \$27,942,437 silver and \$269,971 in minor coins. The total purchases of silver bullion during the year amounting to 2,426,257,138 standard ounces, at a cost of \$24,972,161, being an average purchase of \$2,081,013 worth of silver bullion per month. The average Treasury Department price of silver bullion of British standard during the year was 52 7-10d. The total coinage of standard silver dollars has been \$72,847,750. The amount on July 1, 1879, was \$7,653,649, and on July 1, 1880, was \$19,309,435—an increase in circulation during the year of \$11,655,786. The circulation was further increased to November 1st by the issue of \$6,453,856, making a total in circulation at that date of \$25,163,291. The remainder of the coinage, \$48,934,459, was in the Treasury, \$19,780,241 being held for the redemption of silver certificates

Misrepresentations in Mining.

It never does any good to make too much stir and too much talk about a country before the country warrants it; and it is bound to do absolute harm if falsely extravagant reports are circulated. People read of and listen to accounts about a new and unsettled region with the greatest interest, and swallow the stories told with the greatest avidity. Those who take advantage of this weakness of human nature ought not to grumble when the natural results follow. When people extol their neighborhood to the skies, knowing all the time that the statements they are making are exaggerated, they should not complain if those who find out the falsity of the stories, should do their best to get even by running the country down and doing it harm. Last year and year before, it seemed as if the mining world was crazy on Colorado. The Leadville excitement brought thousands of people into Colorado, and it brought thousands into mining who had before never thought of the subject. Highly sensational and extravagant reports of the country were scattered far and wide. The same stories were told of the Gunnison country and of the Ute reservation. The attention of a large mass of people was turned to the country, and naturally there were thousands who went there expecting to make an immediate fortune, who failed to do so. But now that the stories about this country are found to be exaggerated and the excitement is over, a sort of stagnation has set in, which is far from pleasant. Of course, there are good mines there, some of them paying first rate, but this wild and false statements about the country generally have caused a reaction which is doing Colorado harm.

These mines are no less inexhaustible than other mines. They are no richer than other mines. The excitement is over, and people buying mines there will do so on the merits of the rock, in the future. Investments will be made more soberly and with better judgment, all of which will be better for the country.

We notice a disposition, just now, to give the other side of the question in relation to some of the Arizona properties. Reports from there are not very conservative, to say the least. Descriptions of some of the mines and camps have been rather highly colored. A good many Nevada miners have gone down there, and they do not all speak so highly of the country as they might. In some districts they say the rock is so soft that one man will do as much work as it would take five to do in Nevada. In other places they say the ground is all taken up, and the ledges are not so good as represented.

The local papers should check the too-glowing enthusiasm of their correspondents, when they know the statements are exaggerated. Stick to facts, as it will be better for the country. New Mexico is just now attracting a good deal of attention, and no doubt we will soon see the same sort of statements about that Territory. People who are attracted to a locality by false reports always leave and denounce the whole country.

Six men are at work taking ore from the croppings of the Lady Bryan; royalty, one dollar per ton. They have chartered a little mill down the canyon at which they purpose to reduce their ore. They have been at this business now some six weeks, and have a large run ready to mill. The Enterprise says that the ore taken out averages about \$30 per ton.

SECTION AND PLAN OF LONG FURNACE FOR ROASTING GOLD AND SILVER ORES.

Owing to the great reduction of the stock of bullion at this mint coinage was suspended from October, 1879, to the middle of last April. The appropriations recommended by the director in his report for the San Francisco and Carson mints for the next fiscal year are precisely the same in amount as the appropriation made at the last session of Congress for the current year, namely: San Francisco—Salaries, \$24,900; wages of workmen and adjusters, \$265,000; incidental expenses, \$80,000. Carson—Salaries, \$23,550; wages, \$72,000; incidentals, \$30,000. The production of gold and silver in the United States during the fiscal year is estimated at \$36,000,000 gold and \$37,700,000 silver. It is estimated that probably \$5,500,000 gold and \$4,000,000 silver of domestic productions; together with \$2,500,000 gold and \$6,000 of silver, United States coin were used in manufactures and the arts, besides melting up plate, jewelry, foreign coin and bullion sufficient to make the total consumption in the United States, \$10,000,000 in gold and \$5,000,000 silver.

The work of the mints has been unusually heavy, the deposits of gold aggregating \$78,835,000, or \$30,000,000 above the previous highest year. The chief source of gain was from abroad. The deposits of silver were only exceeded in 1877-8, during the coinage of fractional silver and trade dollars. The receipts of domestic silver bullion was \$2,500,000; foreign coin and bullion, \$2,225,000; American coin

and \$28,304,218 for distribution; of the latter, \$12,918,505 was held in the mint.

BEACH MINING.—P. T. Dowling and William Wellock of San Francisco, who have been stopping at Santa Monica for some days, have discovered gold on the beach, about three miles south of that place. Considerable excitement exists, and claims have been staked out all around. It is said that some claims will yield \$3 per man per day. When any one makes steady wages at beach mining we would like to hear of it. Gold is found all along our ocean beach, but it is very fine indeed and difficult to save. Every year or two we have one of these "beach discoveries," but they seldom amount to anything.

NORTH SAN JUAN is now in a prosperous condition. The certainty that it will soon have a railroad to this place has given new life to the people and created a "boom." Town lots have become valuable and new buildings are being constructed all over the town site. The Times says "give me the railroad, that's what we want and must have." A railroad to this place would enhance the value of property 100%.

FIFTEEN of the 45 collieries of the Philadelphia and Reading company have suspended for December. 3,000 men are out of work.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

A Trip Down the Coast.—No. 2.

EDITORS PRESS:—Los Angeles may remain the commercial center of southern California, but Wilmington can never become its chief seaport. The only port I know of whose entrance exceeds in difficulty and tortuosity that of Wilmington, is Bilboa, in the north of Spain, where the windings of the semi-navigable Neroon have originated the sailor phrase "in the hilboes," which is equivalent to being in a tight place.

The steamer anchored, at about 9 A. M. on Sunday, out in the ocean, some six miles from Wilmington. The alternative, caused by the peculiar facilities of the port for dearkation and embarkation, was to loaf away the day on board the steamer, or to go ashore. Wilmington is whitewashed, so it can be seen before it is reached. It contains a store or two, a post-office, a saddlery, six or seven saloons at least, some warehouses and sheds, and a few cottages. It stands on the angle of a wide flat plain of alluvial silt, a dried up continuation of the mud flats of its bay. It is a good place to shoot ducks and snipe, and would make a good Eden for a Mark Tapley to live in.

Seeing nothing attractive about the place, I essayed to walk to the ocean beach, which was said to be two miles away. After walking three, I reached a salt water slough, at or near the mouth of the San Gabriel river, and found that it was necessary to wade to reach the ocean beach, the sand dunes of which looked provokingly near. So I was forced to content myself with picking up a few marine shells (enough to attest the richness of the ocean shore I could not reach), and one or two brackish water species. The steamer left its anchorage about 10 o'clock in the evening, the whole day having been spent in loading and unloading freight into and out of the lighters. If the steamer and railroad can be brought together without the intervention of these lighters (and Wilmington people say they can), the spot may claim to be at least what now it is not—a landing place.

Before leaving San Francisco my friends had painted for me a picture of San Diego, so graphically desolate that I felt certain the reality could not be worse. The only trees in the place, they said, were two palm trees three miles out of it; the only crop, cactus; the only soil, dust, and the only water 40 ft. (more or less) under ground. The last allegation is true, except when it rains, as it did to-day; but the others must be taken *cum grano salis*. The trees planted by the early settlers (I don't mean the padres, but the Americans who have gallantly stuck to the place through thick and thin) have now grown into trees sufficiently large to overtop the houses and give the place quite a pleasant aspect when viewed from the bay. I need not say what trees they are. They are the same your Californian plants everywhere he settles; the same that monotonously fringe the flat avenues of Oakland, and wave among the sand dunes and behind the wind-guard of San Francisco. O blue gum, pepper and Monterey cypress! cannot a man escape from you even in this remote angle of this large State?

San Diego looms large upon the maps of the dealers in real estate. There is Newtown, Midletown and Oldtown; there is Roseville on the promontory, at the northern end of the bay; there is a town laid out upon the peninsula of San Diego, between the bay and the ocean, and there is National City. The good old saying about a "city of magnificent distances" is in the mouth of every one. But the railway will change much, if not all, of this. So hope the natives, and so, apparently, thinks the railroad company itself. The railroads that on former occasions were talking of coming to San Diego, never bought a yard of land, and never did anything else beyond grading a few miles of track. The present one has acted quite differently. It has bought the Bank of San Diego building; it has bought large tracts of land within the boundaries of San Diego City, and it has bought five-sixths of the National ranch, some 11,000 acres. It has entered into a contract with the citizens of San Diego to connect their city with the railway systems of the Eastern States, and in return for this the city of San Diego will give it large tracts of land within its limits, so that altogether, upon the fulfilment of the contract, the railway will own from 9,000 to 10,000 acres within those limits.

The terminus and works will be at National City; the principal freight and passenger station at a point immediately to the east of San Diego, and thence the railway, passing by Middle and Old Towns, will proceed to San Bernardino. A considerable tract, about 450 acres, immediately east of the present wharf is among the land given by the city on the conditions above mentioned, and it is upon this spot that the depot and wharf of the railway company will be built.

This is the best location upon the bay for the transference of freight, for here a denth

San Diego is 2,200 ft. long, with its terminus in 20 ft. of water. Below the site selected the water shoals rapidly, and the channel becomes narrower, so that at National City, some three or four miles from San Diego, a pier 2,500 ft. long would be needed to reach 19 ft. of water at a spot where the channel is so narrow that great expense would have to be incurred to dredge a basin efficiently wide for a vessel to turn in. For these reasons, the people of San Diego have little fear that their interests will be sacrificed for those of National City, notwithstanding the large interests acquired at the latter place by the railroad through the purchase of the Kimball ranch. The railroad, although incorporated under the new Constitution of California, under the name of the California Southern, and with enough of its shares owned by Californians to comply with the law, is really controlled by the same men who own and control the Atlantic and Pacific, which it is under contract to meet, and the Atchison, Topeka and Santa Fe, the construction of which has already proved so signal a success. It is on account of this that the San Diego people feel now so confident of a prosperous near future. The Boston men who control these railways are too rich and too sure of success to be hought off by the reigning monopoly of California. Perhaps the new monopoly may be no better than the old, but the Eastern people who come here think better of, and hope for better treatment from the Bostonian grandees than from the Californian, and at any rate competition will reduce fares and freights.

The National ranch has been purchased with the view of carrying out a vast colonization scheme. The whole of the large tract is to be cut up into small parcels and sold to settlers, who are to be brought from the Eastern States on favorable terms. The whole of the ranch is what is known as *mesa*; that is, it is tolerably flat and moderately elevated land forming part of the large table or terrace on which San Diego is situated. These lands have hitherto been left uncultivated, except in places where streams that have existed, or that in winter still exist, have scooped out shallow valleys, sheltered by the higher mesa from the winds, and in some cases having a deep alluvial soil. It is claimed, however, by many, that the mesa will bear all that the valleys will, and that the frosts (for occasionally there are slight frosts even here) touch the valleys when they miss the higher mesa. That wells must be dug deeper to procure water is admitted on all hands; but the idea is to procure water for the irrigation of the colony from the Sweetwater river, which runs (when it runs) some 10 miles below San Diego. I say "when it runs" because, except during the winter and spring, the rivers of this section of California do not run, but become dry beds of sand and gravel. But there is water underneath. The water supply of San Diego is procured from the bed of the San Diego river, and in a similar manner it is proposed to utilize the hidden waters of the Sweetwater.

When the railroad has brought San Diego into connection with the Eastern States, it cannot long remain the small and stagnating place that it has been hitherto. With a bay 11 miles in length, the narrowness of the entrance of which keeps the channel scourged, so that there are always from 21 to 23 ft. of water on the bar at low tide, it would secure a share in the commerce of the Pacific, even were it located north instead of south of San Francisco. Its more southern position brings it nearer by 480 miles to all the ports of South America and Mexico, as well as to whatever canals or ship railroads may be made between the oceans across any part of Central America. To New Zealand and Australia it will be nearer than San Francisco. Now seated in loneliness upon her bay, the city of San Diego sees this commerce pass her by, for she is unconnected with any other city, is on the road to nowhere, and is not, in herself, market sufficient to turn any portion of it from its course to the commercial metropolis of the State. But with direct connection with the interior and the East, a portion of this trade will fall to her share, while by the new facilities offered for travel and freight, the goods and passengers carried will increase, not only to the benefit of San Diego, but probably to that of San Francisco also. Enthusiasts prophesy a population of 50,000 or 60,000 here within five years, but minds of more moderate mold are content to hope for 15,000 or 20,000, and from present indications, there appears little reasonable doubt that the expectations of the latter will be realized. Such a growth would not be excessive, nor would such a population be more than the resources of a county almost as large as the State of Massachusetts could find business for in its capital.

W. L. LOCKINGTON.

San Diego, Nov. 25, 1880.

THE Richmond Con. mining company paid a quarterly dividend of \$2.50 per share at the office in London on the 10th of November. This makes a total of \$1,856,000 received in dividends from this mine.

THERE is no quicksilver mine now working in the Geyser region. But to the southwest both the Great Eastern and Mount Jackson companies are pushing things vigorously.

THE Manhattan mill last week reduced 1542 tons; value, \$45,268.57, \$3,715.25 being from custom ores, \$12,332.27 from tribute ores. \$15.

The Skagit Mines Failure.

The British Columbia *Colonist* learns the following facts about the Skagit mines from John Welsh, who left there at the end of October:

The water was very low, and so were mining matters generally. There were about 50 men there when he left. Fully 300 men had left the mines disgusted within the last month. Miles of wing-dams, scores of water-wheels, pumps, machinery, tools, cabins, sluices, lumber, all abandoned. Thousands of feet of lumber strewn the sides of the creek for the first freshet to carry away. Everybody has become demoralized. About 20 companies got to hedrock and cleared nothing to speak of. There has been nothing found in the deep channels of any of the creeks, nor in the hills. The few men left there are working in a streak of top gravel that pays in spots small wages. There are some 20 or 30 men sinking on the main Skagit river, making a bare living. About 30 men will winter in the country. Having their provisions laid in, they think they can make \$3 or \$4 per day. So ends the latest mining excitement. About 1,000 men visited the mines during the summer; 22 lives were lost by drowning and other accidents. Hundreds suffered untold hardships and misery in trying to prospect their claims. The country has been hard on the Puget Sounders, a good many of whom mortgaged their property in order to raise money to pay their claim assessments on Ruyh creek. About \$10,000 in gold was taken out altogether, and over \$50,000 in cash was spent, besides the time and labor.

Mining Districts of New Mexico.

A correspondent of the New York *Mining Journal*, writing from Silver City, New Mexico, gives the following information about the districts thereabouts:

About 80 miles northeast of this place lies the Lake Valley district. Considerable ore has been shipped from this district to the various reduction works, principally to Denver, Colorado, and has yielded generally from \$500 to \$1,500 per ton. Several of the mines have enormous bodies of this ore. Wood and water are convenient here, and the mines are easily accessible.

About 12 miles from Lake valley lies the Hillsborough camp. A great amount of gold has been taken out of these placers during the past few years, but there still remains ground for many years' work.

Eighty miles northwest of Silver City, and in the southwestern corner of Socorro county, in the Mogollon mountains, lies the rich and promising Cooney mining district. It has an abundance of cool, clear water, with timber enough to supply the whole of New Mexico for a great many years to come. The lodes are large, in some instances cropping above the ground 80 ft. and the ore is high grade, carrying copper, silver glance, gray copper, native, brittle and ruby silver and bromide of silver.

Eighty miles below this district is the beautiful and productive valley of the Frisco. This river supplies water power enough to run an enormous amount of machinery, and as the roads from the mines there are of good grade and easy of descent, the mining and treatment of ores can be managed to the greatest possible advantage. This is destined to be the leading high-grade silver-producing district of the southwestern country.

About 10 miles north of Silver City lie the Pinos Altos mines. This was originally a placer camp, and flourished for about 15 years, during which time a very large amount of gold was taken out. It is still worked by Mexicans during the larger part of the year, who manage to get out of the old dirt about 75 cents or \$1 a day. The lodes in the district show free amalgamating gold ore, and have been worked by the rude *atrasta* and made to pay from \$15 to \$50 per ton.

Twenty-five miles northeast of Silver City lies the Georgetown district. In point of hullion yield this district is second in the Territory, Silver City coming first. It produces a carbonate ore carrying a heavy percentage of chlorides and sulphurets. The average ore of some of the mines runs over 100 ounces in silver. A 10-stamp mill and a smelter are working here constantly with fine success.

Eight miles southwest of Georgetown are the famous Santa Rita copper mines. These mines were discovered about 80 years ago, and were worked by the owners for a great many years. The ore was a red and black oxide and native copper. The hullion was carried to the City of Mexico for coinage. Owing to the high freight tariffs, and the want of shipping facilities, the present owners have not been able to work them, but with the iron rail now near at hand, operations will be commenced upon them.

The Cook's Peak mountains contain some extraordinarily large beds of carbonate ore.

The Tres Hermanas district lies about 90 miles southeast of this place. It is a new camp, and, as yet, not much developed, but shows some extraordinarily rich ores. Some specimens assayed \$20,000 to the ton, carrying horn and brittle silver. The main leads lie in porphyry, and are rather narrow, but rich.

The Stonewall district lies 75 miles southeast of Silver City, and adjoins old Mexico. It is 30 miles south of the Southern Pacific railroad, to which it has easy access by a splendid road of very light grade.

several miles on the surface. The ore is very rich, carrying silver glance, brittle silver and sulphurets, and the leads are of good width. A splendid spring breaks out in the midst of the mines, and gives water enough to run a 100-stamp mill. The mines are easy of access, close to the railroad and give every promise of permanent richness.

Thirty miles north of the Stonewall district, and three miles south of the Southern Pacific railroad, is the Victoria district. This is also a new and small district, but an exceedingly promising one. The ore is gray carbonate, carrying horn silver and chloride.

The Eureka district lies about 75 miles south of this place. This is another good camp, and has been worked successfully about two years. The ore is generally in argentiferous galena, mixed with carbonate carrying brittle and native silver.

The Shakespear or Virginia mining district lies about 55 miles southwest of Silver City, and three miles south of the Southern Pacific railroad. This district carries the largest number of veins and has the greatest amount of ore in sight in the country. Probably there is not in existence anywhere else such enormous bodies of mineral-bearing rock. The formation is granite, and the veins true fissures.

The San Simon district lies about 25 miles west of Shakespear, and is looked upon as a "coming" camp. There are a great many veins in this district, and generally they are of large size. The ores are of a fair grade and good quantity. The formation is mixed—granite, porphyry and limestone being present. This camp, like Shakespear, presents a splendid opening for capital. The mines of the Union, which have paid the largest dividends, are those carrying low-grade ore in large quantities.

North of the Gila river about 10 miles, and about 50 miles west of Silver City, some good prospects have been discovered lately. The ore is of gray copper and copper glance of a good grade. The veins are narrow, but very rich.

A FINE DITCH.—The Frost & Reere Canal and Mining Co. have been doing good work this summer. They awarded the contract for building the ditch and flume to Ledlum & Frost. These gentlemen have constructed, nearly ready for use, about 10 miles of flume and ditch, and it is considered one of the finest pieces of work of that kind in the State. The flume is six ft. wide by three ft. deep, and will carry over 3,000 inches of water. The caps, posts and stringers are made of timber 6x8 and the grade is 16 ft. to the mile. The posts that support the flume rest on solid rock. In many places the rock has been blasted and the flume placed close up against a solid wall of rock on posts only four ft. high, while on the other side a person can look down to the river, a distance of 300 ft. Over 200 men have been constantly employed all summer, and some idea of the rapidity with which the work has been done can be drawn from the fact that within six hours a standing tree has been cut down, hauled to the mill and sawn into lumber, framed and nailed in position on the flume. Very frequently 18,000 ft. of lumber has been floated down the flume in one hour's time. If good weather continues, the ditch will be completed to the mine in 20 days. The chiefs, sluices, undercurrents and gizzlies have been placed in position in the mine, and as soon as the ditch strikes the bulkhead everything is ready for work. There is one thing about this mine that the miners here would give considerable to have; and that is a good dump. From the end of the last sluice there is a fall of 1,500 ft. Such a thing as having trouble with tailings will be unknown to the owners. The mine is considered to be one of the best in the State, having been sold some time ago to Boston capitalists for the sum of \$200,000, and to-day there is not a dollar's worth of stock to be had at any price. There is a face of gravel over 200 ft. in height, ranging from one mile to a mile and a half in width, and running back along the ridge for over five miles—an almost inexhaustible supply of gold-bearing ground. Messrs. Frost & Ledlum deserve great credit for the workmanlike manner in which the ditch and flume have been built; also for their promptness in completing the work.—*Oroville Mercury*.

CAMPS OF SOUTHEAST CALIFORNIA.—The new discoveries of gold and silver in the Mojave district are far beyond what is generally known. The rock is rich with metal from the grass roots down. A large number of men from Los Angeles, Pasadena and other places are busily at work, opening mines, making ditches for water, etc., while others are prospecting and assaying. James Noel, President of the Sanchez and Soledad mining companies informs us that vigorous work will be recommenced in a few days on these valuable mines which were opened last summer. Some fine hullion was taken from the Sanchez mine in the summer and plenty of rich smelting ore is in sight. The gold mine in which the Pasadena and Los Angeles people are interested has a water ditch nearly completed that will carry 4,000 inches of water and a first-class new 10-stamp on the way to be stamping out the golden nuggets before New Year. A gentleman just returned from this mine assures us that there is a million dollars in sight. Oro Fino, has three shafts 10 ft. deep and assays \$800 per ton. The Oro Grande, the Garfield and the Buena Vista, belong to the same parties. From the latter some assays of

MECHANICAL PROGRESS.

Forms of Cutting Tools.

Perhaps there is no greater hindrance to improvement in the mechanic arts than the content that is satisfied with present appliances and the prejudice that refuses to believe that an improvement can be made. This conservative sentiment extends to all matters affecting our lives, and sometimes is ludicrous in its complacency. With thousands no almanac can compare with the "Old Farmer's Almanac," by Robert B. Thomas.

It is held by some progressive mechanics that our present system of working metals, after they are cast or forged, is wrong, or is susceptible to some almost radical improvements. They hold that the plan of a stationary tool, held at a certain angle against a revolving shaft is not best, or that the shape of the cutting tool is not best, or that some essential modifications should take the place of our present practice. It is not the intention of this article to consider all these objections, nor to assume to dictate in any one of the improvements suggested, but simply to confine comments to some proposed innovations. And these relate to the forms of cutting tools with reference to the materials to be wrought.

Every mechanic will agree on the obvious fact that a form of tool adapted to a hard, rigid substance is not, therefore, adapted to a soft, yielding substance. The worker in metals knows that he must grind a turning tool for copper and its compounds different from the form or angle to which he would grind a tool for cast or wrought iron, or steel. So much can safely be allowed.

But it is a question whether a similar distinction is applicable, also, to the differences between wood and metals. And yet a mechanic of some 40 years' experience contends that the action of a turning tool is, or should be, the same whether the material to be turned be wood or metal. The fact that this difference has always existed and been recognized in practice does not prove he is wrong. It may be that we have been, for 40 years and more, following tradition rather than observing practice.

The ordinary practice is to have the entering portion of a metal turning tool somewhat higher in relation to the center than the after cutting portion. The effect of this form is to lift outward from the center the material to be removed. The observant mechanic insists that instead of this lifting outward there should be a shaving downward, precisely as the wood turner's chisel acts. Everybody who has turned wood, or has noticed the process, knows that the work is done from the exterior toward the interior, and not from the center outward. He proposes that the "point" of the tool should follow the cutting surface, just as the work of the beveled edge of the wood turner's chisel begins with the surface and ends with the finish. In short, he would shave off the outer surface instead of cutting down to the finish surface. He illustrated it by the use of an ordinary pocket knife, cutting a spiral circle around a piece of wood.

There may be sense in his suggestion; there certainly is sense in it where the outer circumference is irregular. In such a case the surface irregularities should be removed by the "shaving" or surface process. But when the revolving object has assumed a proximate cylindrical form, it may be questioned whether his system is thoroughly and in all cases correct.

This subject is one for experiment rather than rule, and probably may be elucidated by tests rather than settled by dicta. Certainly, when old time workmen differ in regard to the proper shape of cutting tools for metals, and some experienced mechanics reject the records of their experience and turn approvingly to the tests of their experiments, it is not improper to suggest that possibly our old fashioned methods are susceptible of improvement. There are occasionally opportunities offered in almost all shops for experiments which may revolutionize the entire system of tool shapes now in use for working metals.—*Boston Journal, Cor.*

INVENTING.—Inventing to-day, says the *Iron Age*, can be classed among the exact sciences. It is no longer a matter of happy accident, or even sound mechanical judgment. The world has progressed rapidly during the last 30 years, and to-day we find that the merely ingenious man can do but little that is of value to the world; in other words, something more than ingenuity is necessary to the production of a successful invention. Thirty years ago a good mechanic could hardly spend an hour in a shop without seeing an opportunity for improvement in something, and at that time what was true in one shop was true everywhere. Since then a whole generation has been steadily at work improving and inventing; mere ingenuity has exhausted its powers and even originality has but a limited field in which to seek profit in inventing. The first task of the inventor now is to discover a want; he must then find out whether any attempts have been made to meet this want; if so, how, when, and by whom; in other words, he must learn the state of the art, so that he may avoid traversing the foot-steps of others who have failed. These are not matters which can be guessed at; they call for careful study, and when he has learned all he can about the subject, he is ready to attack the

About Filing Saws.

The all-absorbing question of the present day among mill men seems to be, how can we run thin saws? Now, the practice of many filers is to use a beveled face, or beveled backed tooth—or both—claiming that it cuts easier and runs straighter than any other. Having learned this when young, they conscientiously think that it is all so, and as it is very difficult for most men to file a square tooth, they stick to the old bevel, and will not try the square. This is their practice, and this class of men number about one-half the filers.

In some sections all filers use this absurd old-fashioned tooth, which practice has already said was wrong. We will look at this phlebotomy in a theoretical way. It is a well-known fact that all hand-filed saws get "out of space," that is, alternate spaces between the teeth get wider than the others, consequently, the teeth following these spaces have more work to do than their fellows, and, as each draw outward, the teeth having the most to do—and they are all on the same side—will pull the hardest, and the saw be drawn that way just in proportion to the amount of feed carried or the work done, and no amount of hammering, tinkering or grinding will prevent this continual pull and hard drawing, so long as the phlebotomy tooth is used. Then we will look a little further and see what theory has to say against this beveled tooth. The filer must give his saw all the set necessary to clear itself upon, running on slow feed, and when forced to carry heavy feed, the teeth will be drawn outward all that they will spring, increasing the width of the cut from 1-16 to 1/8 of an inch, although the saw may go perfectly straight. This condition of things will make the lumber thicker at one end than the other, and as all saws are generally started in on slow feed, which is steadily increased, until the other end is reached, there is a taper on both sides of the board. Then again, when these teeth run into a hard knot, they are suddenly drawn in opposite directions, making the saw cut wider and consequently very much harder. This sudden wrench has been the cause of breaking more saws than any other one thing.

There are reasons enough why a man who files a phlebotomy tooth cannot run thin saws, because they are more sensitive than thick ones, and show the defective fitting more readily, and no filer ever fitted thin—if hammered right—with a perfectly square tooth, top and bottom, who could not run them and do good work. At least, of the hundreds of mills I have visited in the last three years, I have failed to find one. If mill owners would require their filers to swage the teeth full and heavy, giving them one-fourth of an inch side joint, with a comparatively steady motion, a 10-gauge saw can be run just as easy as a 6-gauge saw. No man should ever use a taper saw, for if it be tapered on one side and straight on the other when standing, it will be tapered alike when running, as the centrifugal force will straighten it up and put twice the strain on one side that there is on the other, making it more liable to break. These theories can be proven by any mill man, without cost, in his own mill, and will enable him to show himself practical as well.—*W. L. Covey, in N. W. Lumberman.*

ANIMAL FAT AS A LUBRICATOR.—Three or four years ago some of the mechanics in the Pennsylvania railroad shops were overhauling an engine, and they found a peculiar irregular run worn, or rather eaten, half an inch deep, several inches long and from one-quarter of an inch to an inch in width, into the steel of a steam chest. It was evidently the result of the action of some rapid and powerful corrosive, but its source was a mystery. For the oiling or lubricating of steam chests or cylinders a preparation of tallow is used. The company's chemist began a series of analyses to determine the cause of such rapid decomposition, and after considerable experimenting he discovered it. He found that where animal fat is allowed to lie a long while before rendering, the decomposition sets free in large quantities stearic, palmitic and oleic acids, and that the stearic acid, heated to the temperature of steam, acted very rapidly in decomposing iron. This at once yielded a clue to the corrosion found in the old steam chest, and now every barrel of tallow used by the company is subjected to analysis to determine whether it is made of new fresh fat, or whether it is charged with the various acids due to decomposition.

STEEL BOILERS.—In an article on steel boilers, the *Engineer* says: While we admit that excellent boilers have been made of steel, we cannot shut our eyes to the truth that a great deal of an apparently admirable metal is quite unsuitable for this purpose. This Bessemer steel, it is said, cannot be used for boiler plates with any certainty of obtaining a satisfactory result, and the reason appears to be this: The whole process of clearing comes five tons or so of iron from carbon, silicon and other impurities occupies nearly 20 minutes. When the contents of the ladle are under-blown or over-blown, the steel is unfit for boiler-making. In the Siemens-Martin process, however, the chances of spoiling the steel are much less. In working that system, if the metal be tapped half an hour sooner or later, the difference in the quality of steel would not be so great as an error of a minute would produce in the steel of the Bessemer

SCIENTIFIC PROGRESS.

A Delicate Instrument.

Prof. S. P. Langley, of the Allegheny observatory, read a very interesting paper at the recent meeting of the National Academy of Sciences, in New York, on the "Measurement of Radiant Energy," in which he described a novel and very delicate instrument, which he had found it necessary to devise to take the place of the thermopile, which he found was not sufficiently sensitive for his purpose. The apparatus is founded on the principle that if a wire conveying an electric current be heated, less electricity flows through it than before.

The application of this principle is thus made: Iron or steel is rolled into sheets of extreme thinness. Of these sheets 50 laid one on the other did not together equal the thickness of light tissue paper. Minute strips, 1-32 of an inch wide and 1/4 of an inch long, cut from this were united so as to form a prominent part of the circuit, through which a current of a powerful battery passed to the galvanometer. Experiment proved that an almost inconceivably minute warming of a set of these strips would reduce the passage of the electricity so as to produce very large indications on the registering instrument. The instrument thus formed was from 10 to 30 times more sensitive than the most delicate thermopile; but this was almost a secondary advantage compared with its great precision and the readiness with which it is issued. The thermopile is very slow in its action. This new instrument, which he calls the thermal-balance, takes up the heat and sets with it again in a single second. It is almost as prompt as the human eye itself.

To show its sensitiveness, the statement was made that it would register a change in temperature of the iron strips, just described, which did not exceed 1-50,000 part of a Fahrenheit degree. When mounted in a reflecting telescope it would record the heat of a man or other animal in a distant field. It would do this equally well in the night, and might be said, in a certain sense, to give the power of seeing in the dark. A more valuable proof of its efficiency was shown in a series of measurements of the heat of the moon, made under varied circumstances, to guard against error, but each made in a few seconds. All agreed in showing that the almost immeasurably minute amount of heat from the moon could be certainly measured by it, even with a common refracting telescope.

BALLOON PHOTOGRAPHY.—An interesting paper on balloon photography, giving a detailed account of the results of some experiments made by M. De Fonville, in the neighborhood of Rouen, on the 14th of June last, is contained in a recent number of the *Spectateur Militaire*. Two views of the surrounding country were taken during an aerial excursion, from a height of about 3,300 ft., while the balloon was traveling at the rate of 20 to 25 feet per second. The views were taken from the direction opposite to that in which the balloon was traveling. Miniature views were obtained of territorial sections about 23 acres square, upon which roadways, house roofs, garden walls, hedges are plainly discernible. Had the sky been perfectly clear, M. De Fonville entertains no doubt that every human figure within the scope of the lens would have been distinctly visible in the pictures obtained, and he points out the obvious availability of balloon photography for supplying exact information respecting the dispositions of an enemy's camp and the number of his forces in war time, the operator being safely beyond the range of any projectile susceptible of discharge from a rifle or other "arm of precision." The objections to the utilization of balloon photography for military purposes are the rapid movement of the balloon, which interferes with the distinctness of the picture, and the impossibility of steering the balloon so as to impart to it exactly the desired direction.

ELECTRICAL PHENOMENA IN TROPICAL COUNTRIES.—In a note addressed to the French Academy (*Comptes Rendus*, p. 446), M. L. Amat calls attention to the fact that the electrical phenomena produced by the friction of the hairy coat of animals, acquire a remarkable intensity in tropical countries, especially to the north of the Sahara, toward the 35th degree of latitude. At an altitude of 2,500 to 3,600 ft., he found that by passing a comb through the hair of the head or heard, sparks might be produced two or three inches in length. The phenomenon occurred at its best at from 7 to 9 o'clock in the evening, when the weather was warm and dry. In horses the effects are still more marked, and the hairs of their tail extend out from each other so as to form a sort of fan. If the hairs be touched, a crackling of the sparks is heard, and at night these are distinctly visible. Sparks are also easily produced by the use of the brush or currycomb. According to M. Amat, the electricity developed in the tail of the horse is positive, as he learned by experiment. Naturally, during rainy or moist weather, the electrical tension is considerably lessened, and it is likewise less sensible in the stable than in the open air. In man the accumulation of the electric fluid is not so great as in the horse, doubtless because he is not so well insulated from the earth as the latter, the horny

Spontaneous Combustion of Coal.

Herr Haedicke, of Hagen, Germany, has been making some investigations on the causes of spontaneous combustion of coal, which indicate that some of the views now held relating to the subject are erroneous. It has been quite generally believed that the decomposition of the pyrites often contained, finely distributed in coal, and the increase of temperature due to that decomposition, were chiefly responsible for the greater number of accidents reported as having arisen from "spontaneous combustion." Herr Haedicke has endeavored to produce ignition of coal artificially, and though his experiments were conducted with materials differing in their nature from those in coal, his results are not without some significance. It should be stated that far from overrating their value, he insists that they be looked upon as preliminary only. He took small pieces of charcoal, soaked them in sulphate of iron and then treated them with sulphide of ammonium, thus impregnating them with a sulphide of iron. Placing them into a glass tube he exposed them to different temperatures, at the same time forcing a gentle current of oxygen through the tube.

He found that ignition took place only after a temperature of about 300° Celsius had been reached. Ozone did not cause an ignition at a lower temperature, nor did powdering the charcoal affect the general result. On the other hand, saturation of the oxygen with steam prevented any ignition, even at a temperature of 360 degrees. The result was a little different when the sulphide of iron impregnating the charcoal was produced by soaking it in an ammoniacal solution of sulphate of iron and passing a current of sulphuretted hydrogen over it. In this case the temperature of ignition was about 200° to 220°, while sulphide of iron by itself ignited at 200°. It is important to state that no combustion of the impregnated carbon took place when a current of atmospheric air was passed over it instead of a current of oxygen.—*Iron.*

HISTORY AND LIMITS OF THE VOICE.—Dr. Delauney, in a paper read before the French Academy of Medicine, gives some details on the history and limits of the human voice, which he obtained after much patient research. According to the doctor, the primitive inhabitants of Europe were all tenors; their descendants of the present day are baritones, and their grandsons will have semibass voices. Looking at different races, he calls attention to the fact that inferior races, such as the negroes, etc., have higher voices than white men. The voice has also a tendency to deepen with age—the tenor of 16 becoming the baritone at 25, and base at 35. Fair complexioned people have higher voices than the dark skinned, the former being usually sopranos or tenors, the latter contraltos or basses. Tenors, says the doctor, are slenderly built and thin; basses are stoutly made and corpulent. This may be so, as a rule, but one is inclined to think there are more exceptions to it than are necessary to prove the rule. The same remark applies to the assertion that thoughtful, intelligent men have always a deep-toned voice; whereas triflers and frivolous persons have soft, weak voices. The tones of the voice are perceptibly higher, he points out, before than after a meal, which is the reason why tenors dine early, in order that the voice may not suffer. It was almost superfluous for him to remind his learned audience that singers who were prudent eschewed strong drinks and spirituous liquors, especially tenors, for the basses can eat and drink generally with impunity. The South, says the doctor, furnishes the tenors, the North the basses; in proof of which he adds that the majority of French tenors in vogue come from the south of France, while the basses belong to the northern department.—*Scientific American.*

WHAT IS INSTINCT?—Instinct is defined by G. Glaser, in the *Scientific American*, as "nothing else than an obscure remembrance of experiences which were made by earlier generations. A clear remembrance which extends over the boundaries of our individual life has, it is true, not yet been found among men, but this does not prove anything against the above assertion. Such a remembrance we do not possess, even for the complete period of our present life. Our memory does not extend back to the first years of our infancy. It is interrupted by sleep; it may be strengthened by exercise or weakened by neglect; it may be interrupted by many abnormal states by which life itself is not interrupted. Whether in dreams, or in conditions of abnormal nervous excitement, in hysterics or other sickness, memory is increased, so that it really extends over the period of our so-called individual life, is a question which, although much abused by humbugs and impostors, might still arrest the attention of the scientific investigator. And though it remains an open question whether the memory of man has such an extension, and though even for the human race the contrary may be proven, it nevertheless might be possible that some animals are endowed with a memory which reaches far beyond their so-called individual existence."

CRYSTALS OF HÆMINE.—F. Hoyer has examined crystals from the blood of men, oxen, swine, sheep, dogs, cats, rabbits, guinea pigs, mice, pole cats, poultry, pigeons, geese, ducks, *Rana esculenta*, and *temporaria*. All have one only crystalline form. They belong to the monoclinic or triclinic system, probably the for-

There are only 5 men at work in the mine and 2 at the mill, which goes to show that the daily yield, as stated, is profitable. The Alpha hoisting works and mill are driven by steam and a 20-horse power engine. The latter is the result of a crushing in the Golden Gate claim was given. That claim adjoins the Alpha on the west, and the crushing of rock taken out was from the same pay eluto on which the Alpha is working, and the latter has a large piece of ground between the present working drift west to the boundary line between the 2 claims, and, therefore, the Alpha owners feel assured of good pay rock for a long time to come—at least 12 months on the present level—without sinking any deeper. The Alpha prospects are very good indeed, and the owners feel that that mine gives assurance of profitable working for years to come.

GOLDEN GATE MINE.—A nice clean-up has just been made at Sothern's mill of 47 loads of quartz taken from the Golden Gate mine by tributaries. The result was \$1,021.50 or \$34.50 per load. The rock was taken from a drift from the incline at the depth of about 230 ft. The Golden Gate is an adjoining claim to the Alpha on the west, and on a ledge parallel to and several hundred ft north of the Idaho. The ground is owned by Poyser, Howe and Treweek, but is not regularly worked, and its machinery upon it is a horse whim. Of late a company of tributaries have been at work in the mine, and the above is the result of their first crushing. The ledge sneaks a width from 18 inches to 2 ft, which is about the same as found in the Alpha. This crushing may induce the owners to put on a good hoisting and pumping rig by which the work can be done in the mine to better advantage. There is certainly encouragement for this to be done.

BLUE BASIN MINE.—The sale of this hydraulic claim at Moore's Point is likely to have an excellent effect. The purchasers are Eastern men of means, and as the mine is a good one, has been placed under good management and will be extensively worked. We are satisfied that the investors will shortly reap good returns that will lead other Eastern capitalists to see the wisdom of investing in Nevada county properties. The first report as to the amount paid for the claim was, we are now told, too high. The owners of it received about \$10,000 apiece.

A MINING TRANSFER.—Piero Humbert, Jr., has acquired title to the Bear River tunnel tunneling and mining company's properties, which begins at a point about half a mile below the junction of Greenhorn creek with Bear River, and extends upwards along the latter and its tributaries a total distance of more than 22 miles. He has also bonded D. D. Shattuck's claim in the same vicinity. It is reported that Mr. Humbert is negotiating with a strong Eastern company who, if they determine to purchase, will work the property, which is situated in Nevada and Placer counties, on an extensive scale.

ROSE HILL LENS.—Grass Valley Union, Dec. 7: The Rose Hill ledge, on Winchester hill, which has been worked in a small way for a year or more, gives promise of making a mine, judging from the different crushings that have been made. The ledge was discovered, it is said, as a blind ledge 25 ft. below surface, where it was only 6 in. thick, but at the present depth of the shaft (62 ft.) it is from 4 to 6 inches. The first crushing from the ledge was made in November of last year, when 5 loads gave 284 ozs of bullion, of the value of \$480. The next crushing, in February, of 20 loads, gave 150 ozs of bullion; value, \$2,551.25. In June last was the next crushing, of 10 loads, giving 41 ozs of bullion; value, \$670; in August, 22 loads, yielding 41 ozs of bullion; value, \$700; in September 20 loads, yielding 37 ozs of bullion; value, \$1,391.50; and on Oct. 23 13 loads, yielding 140 ozs of bullion; value, \$2,384.50, or about \$132.50 per load. This is the last crushing that has been taken out, and probably none will be during the winter, or until proper machinery is put on to handle the water. It will be seen from the result of the crushings that the quartz has been of a fine quality, and much of it very rich. It is the intention to put steam machinery on the claim and work it with system.

PLACER.

THE ACTIVITY AMONG PROSPECTORS.—Placer Herald, Dec. 4: We learn from Mr. H. P. Hanson, one of the proprietors, that the Pugh mill has run steadily on custom rock since last May, and that the general average of the ore has been very satisfactory. In addition to the work of this mill several other mills have crushed more or less custom ore, which makes the amount in the aggregate considerable, and shows better than general terms can the great amount of prospecting that has been going on, being done in this part of the country. There is, perhaps, no district in the State where prospectors, on an average, get as big returns for their work as here.

THE STORM.—Dutch Flat Forum, Dec. 4: The long-looked-for storm of winter is upon us once more. The snow commenced falling on Wednesday morning early and continued until noon, when it turned a little warmer when it set in. In the afternoon the wind was high, and the storm first came upon us, much to the delight of our miners. We understand most of the fall has been snow above Alta, although the ground has been warm enough to melt some of the first fall, while from Dutch Flat down there has been but little snow, especially below Gold Run. If the storm will end up with a warm rain and start the snow above to melt a little, all our hydraulic mines will be started up on next time, and times about this section will be livelier than for some time.

THE DEEP SHAFT MINE.—owned by the Cedar Creek Ditch Co., F. M. Chadbourne superintendent, is being put in condition for hydraulic washing as soon as sufficient water runs in the ditches, and present indications are good for an abundant supply soon.

TUOLUMNE.

PIETY HILL.—Union Democrat, Dec. 4: Work is to be resumed on the Bonanza claim, Piety Hill. J. O. Divoll has had a 10-horse power donkey hoisting engine put in place, which is now at work clearing the mine of water. There is quite a lot of water in the opinion of mining men, and work is going on in different places which sooner or later may unfold another big strike.

TULARE.

CLAIMS LOCATED.—Visalia Delta, Dec. 2: Some 11 years ago a man by the name of Stone visited Lake creek, east of this place, in this county, and found a satisfactory prospect of placer gold at a point called Rancheria flat. Business called him elsewhere, but lately he has returned in company with Mr. Harris, of Mussel Slough, and since September these parties have had several men employed in erecting hydraulic works, and preparing to mine on an extensive scale. The ground is said to be about 14 ft deep, with gold all the way down. There is plenty of water, and most of the year 1,000 inches or more of water is at hand. The presence of these parties has caused numerous prospectors to come in, and recently some 8 miles of the creek bed have been located, as well as numerous claims on the east fork of the stream. The ground has been looked over by prospectors for a quarter of a century, and it remains to be determined whether the enterprise will pay.

NEVADA.

WASHOE DISTRICT.

The following statements have been made this week by superintendents of prominent mines:

UNION CREEK.—During the past week 320 tons and 800 lbs of ore have been taken from the 1650 level, and 310 tons and 1,600 lbs have been sent to the mill; assayed, \$38.54. On the 2500 level the west drift from the upraise has connected with the winze down from the 2400 level. The drill hole from the bottom of No. 1 winze has been extended 160 ft; assays from a trace to \$10.

CALIFORNIA.—During the past week 738 tons of ore have been extracted from the 1650 level, value, \$17.82 per ton. On the 2500 level the south drift from the upraise advanced 34 ft. On this level a chamber for a joint Ophir raise is being cut out. Amount of bullion in office, \$62,761.97.

MEXICAN.—On the 2500 level the joint Ophir east winze has been sunk and timbered 12 ft, and the cages have been placed in position.

OPHIR.—On the 2500 level the joint Mexican east winze

has been sunk and timbered 12 ft; the joint Mexican west crosscut has been extended 30 ft, and the joint California east crosscut 30 ft.

VACACAY.—During the past week 337 tons of ore have been extracted; assayed value, \$25.41 per ton. On the 2300 level the south lateral drift has been advanced 29 ft. Amount of bullion in office, \$40,497.

UNION SHARP.—A tank pit is being cut out at the 1600 level, a bob pit at the 2300 level, and are casing timbers at the 2400 station.

YELLOW JACRET.—During the past week we have been employed on repairs to the pump engine. No work going on in the mine.

SILVER HILL.—During the past week our winze has been sunk and timbered 15 ft. The water in the winze is hot and increasing. All our machinery is in good order and running well.

AURORA DISTRICT.

PROSPECTS.—Esmeralda Herald, Dec. 4: Work progresses favorably in both tunnels. The mine looks well. The character of work being done at present is merely for the purpose of prospecting.

NEW ESMERALDA CON.—Under the management of Jas. S. Mooney, who has 5 men employed, work has commenced in earnest on this property last Monday. The ground comprises 5 ledges running parallel with each other, 3,000 ft long by 1,000 ft wide. The work now being done is on the two western ledges and midway of the 3,000 ft, where the company are sinking on the croppings. The ledge at this point shows a width of 8 ft, 26 inches of which is ore that assays all the way from \$60 to \$125 per ton. It is fine looking ore as we ever saw and is free from mill scale. The pay streak is growing wider as depth is attained. The ledge is very regular, and the whole country round about shows no signs of volcanic action. The owners, D. C. Simpson, O. Kimball, S. M. Booker, J. S. Mooney, F. Neal and D. J. Lewis, are confident that they have struck a big mine.

CHERRY CREEK DISTRICT.

PROSPECTS.—Esmeralda Sentinel, Dec. 5: M. Alexander, a merchant of Cherry Creek, came over in answer to a telegram from his brother, Mr. B. Alexander, who met with no accident here a few days ago. The Cherry Creekers says he prefers to stay at home rather than risk a trip by stage and winter weather, and only a matter of life or death would start him out of his place of business. Cherry Creek is improving every day. Many are dropping in from surrounding camps for a winter's comfort in that metropolis of White Pine; the mills are steadily bumping away and a new one is under construction; parties are grading the road to the Teacup mine on the mountain, and general prosperity reigns.

DUN GLEN DISTRICT.

LANE SYNE.—Silver State, Dec. 4: Vance M. Nelson, of Dun Glen, informs us that the Lang Syne Co. have been working richer ore lately than ever before, and they expected to make a clean-up that will astonish the natives. Only 2 miners are at work on the Auburn mine, recently purchased by a Chicago company, but the force will be increased to at least 20 men as soon as Supt. Purnort arrives from the East, which will probably be about New Year.

EUREKA DISTRICT.

EUREKA TUNNEL.—Cot. Sentinel, Nov. 30: This great enterprise is now completed a distance of 1,538 ft. At the breast the air is foul and retards work. The first 100 ft of the tunnel passed through a limestone formation; the next cut is through a clay or argillaceous shale nature, 300 ft in length; next through 900 ft of ore-bearing limestone, impregnated with ore of a nodular character; the last cut is through 253 ft of clay shale. Here the clay shale terminates and runs into calcareous shale of a hard nature, about 900 ft from the mouth of the tunnel is crosscut No. 1, running north about 60 ft in length, which is impregnated with ore of a carbonaceous nature, and of a bumpy character, one bunch connecting with another, as if they were the vanguard of large ore bodies, which is usually the case in Prospect mountain. About half way in this drift are upraises which contain ore about 2 ft wide of low grade. A little further along a body of manganese is seen, which runs as high as 5700 ft. Enclosed in the manganese is a body of chloride ore which has not as yet been developed, as it interferes with working in the face of the tunnel. The facilities for working the tunnel are first-class. A commodious blacksmith shop has recently been built. The conduct of the work is under the intelligent superintendence of Mr. Maurice Hartnett, who is one of the oldest miners on Prospect mountain. The time is not far distant when a large body of ore will be had in this tunnel enterprise.

LOW GRADE.—Eureka Sentinel, Dec. 5: The latest workmen in the Phenix mine say that there is lots of low-grade ore therein, but it cannot be worked to pay at present rates. They agree that it is of the same quality as that upon either side, in the K K and Jackson. Let us pray for a cheaper method, that the enormous quantities now in sight in these properties may be turned into bullion.

OSCEOLA DISTRICT.

STARTING UP.—Ward Reflector, Dec. 4: The mill at Osceola we learn from Boardman, starts up to-day on ore from the district which Osceola mines. Ore projectors of the water ditch are sinking to bedrock in a number of places, but outside of that there is but little work going on in the district. The first cold snap froze up Jack Irwin's water works and stopped what placer mining that was going on.

PIOCHE DISTRICT.

WILL SHUT DOWN.—Ward Reflector, Dec. 4: A letter was received here a few days ago dated Hamilton, November 23th, in which the writer says the Eberhardt & Aurora tunnel will shut down in a few days, and that the mill will run a month and possibly 6 weeks, when the stamps will be hung up for work and perhaps longer. We hope the writer's information is without foundation.

TO BE CONSOLIDATED.—We have received a letter from Pioche in which the writer says the prospectors good for the Raymond & Ely and Meadow Valley mining companies consolidating. This would put an end to the trouble between the two companies that has existed for the past 6 years.

SILVER CANYON DISTRICT.

PROSPECTS.—Ward Reflector, Dec. 4: J. C. Campbell, who returned from Silver canyon a few days ago, informs us that it was the intention to drop stamps on or about the 20th of December on the only mine from which any ore is at present being taken is the Sadie L., which assays from \$300, the lowest, to \$2,600, the highest. Snow was all of a ft deep in the canyon when Mr. Campbell left.

STAR DISTRICT.

MINING PATENTS.—Silver State, Dec. 4: United States patents for the Heydenfeldt, De Soto and Woolcock mines, on the Sheba lode, in Star district, have been received from Washington, and are now recorded in the county records. One of the mines—the De Soto—is being worked, and produces considerable rich ore.

WINNEMUCCA DISTRICT.

THE STRIKE IN THE PRIDE OF THE MOUNTAIN.—Silver State, Dec. 3: The ore body discovered last Saturday in the Pride of the Mountain mine promises to be the most important strike ever made in Winnemucca district. It is about 250 ft from the surface and below the break in the formation. The ore is of a different character from any heretofore found in the mountain. The ledge carries about 30 inches of solid ore, which averages over \$100 per ton, from \$10 to \$15 of which is gold. The high percentage of gold in the ore is considered a good indication of the permanency of the vein, by miners. E. P. Torrey, who is working the mine, is now prosecuting in the winze day and night.

ANTIMONY MINES.—J. M. Brown, of Unionville, is in town. He is engaged in working antimony mines in Bloody canyon, between Star and Unionville, and ships, on an average, about 23 tons of the ore a month. We understand that he is making the business pay.

CLOSED DOWN.—The Arizona mill, at Unionville, closed down a few days ago, in consequence of the Chinese, who had contracted to supply it with fuel, failing to do as they agreed. They wanted their pay every Saturday night, and as some bullion owned by Christ Lark, who has leased the mill, was attached for the Arizona Co.'s debts, he did not have the money on hand as he expected, when he shipped the hullion to pay them. The mill is doing well, and will start up again shortly.

ARIZONA.

SILVER KING MINE.—Globe Chronicle, Dec. 3: We are informed that the Silver King mill is regularly turning out bullion at the rate of \$10,000 a day, and that the ore is soft and easily mined, that very few men are required to keep the reduction works fully supplied. We are glad that the company is now turning out bullion at a rate commensurate with the size and richness of their mine.

THE CENTENNIAL.—This ore from this mine is panning out splendidly; the 5-stamp Isabella mill is turning out a big bar of bullion every day, and they can keep it at that during the contract with the milling company. Everything at the mine is progressing favorably, and in opening out a new station at the bottom of the main shaft 120 ft deep, they found 2 ft more of good ore—making the lode 8 ft wide between the walls.

BULLION.—This claim crosses the road to Miami about 4 miles from Globe. Assorted ore has been carefully sampled, which returned 153 ozs per ton, and a ton reduced at the Isabella works, unassorted, returned \$41.25.

KATY DRIVE.—This claim adjoins the Bullion on the northeast, with a capital surface show of ore. The main ledge has large mineral-stained croppings, and a shaft sunk 20 ft proves it to be over 8 ft wide, with ore all through, some samples of which yield good assays. The next claim on these ledges to the northeast is the Gringo, which has the same solid syenite formation.

ESCAMO.—This mine was favorably known about 3 years ago, but after being incorporated into its stock manipulated by a California company (who only spent about a thousand dollars in sinking the main shaft, and then allowed it to be sold by the Sheriff to the present owner), it has lain idle, except for the necessary assessment work. The main shaft is about 80 ft deep, being sunk on the inclined ft-wall of the ledge, which shows smooth and well over 10 inches thick, and has been sunk some very rich ore, but in sinking, the ore taken out would not pay without a close assaying, and so was all thrown over the dump.

REN ROVER.—This claim is on the same lode, and lies northeast from the Escamote, the surface formation being the same on both claims—solid gray syenite. Two shafts (40x40 ft deep, respectively) have been sunk on the ledge, which has a surface of 15 ft, and has been sunk out of 35 ft. The ore from the shafts and cut is very high grade, some milling samples returning a dollar a lb, and a lot of 10 tons yielding \$500 per ton.

TUE BLUE BIRD.—On visiting this well-known mine this week, which is on a parallel vein with the last mentioned mines, we found some men at work on the surface, where the main ledge shows at the top of the hill. The ore streak is over 10 inches thick, and has been sunk on about 14 ft. Assays from it will average over 500 ozs per ton. It is owned by a private stock company in San Francisco, who intend to push its development in earnest.

THE EMELINE.—This claim adjoins the Blue Bird on the northeast, and has in addition to its ledge another good parallel vein, which shows well. The ledges are in solid syenite, and show large in the lower workings, the ore streak being from 2 to 5 ft wide. About 140 tons of ore have recently been reduced at the Arizona Mexican mill, which yielded an average of \$100 of silver and \$5 of gold per ton.

GERMAN FRIEND.—Mr. Hayes is now at work on this claim, and is getting out good ore. It lies northeast from the Emeline, and is believed to be on the same ledge. A shaft is being sunk, and is now down 18 ft on the ore streak, which will average 3 ft wide. In an open cut the ledge has been stripped for 150 ft, and considerable rich ore taken from it. An average of 6 tons reduced lately yielded \$150 per ton in silver.

THE DANUBE.—The main shaft is 30 ft deep, and a sample of the ore returned 153 ozs per ton. This claim is a good prospect for a paying mine.

GOCORONA.—This is on a large ledge which crops out along the side of the hill above Independence Spring, which, as the surface shows, is over 40 ft wide, lying between syenite and quartzite formations. Two small spurs have rich ore shown in surface cuts, and the owners are now running a tunnel.

CRITERION.—This claim lies in the same section as the Blue Bird, and is located on a large ledge, which, as proven by the surface, is 15 ft wide. There are a number of open cuts and prospect holes on the ledge, which, with 2 shafts 12 ft deep, prove the continuance of ore body for a long distance.

SILVER ROUGH.—This forms one of the same group as the Criterion and Big Indian, and has a well-defined ledge, from 8 to 10 ft wide, showing through the solid syenite formation.

ELIO ISLAND.—This is the third claim in the group, and has a good-sized ledge whose width has not as yet been accurately determined, although it fills the shaft, which is 40 ft deep.

BLACK HORNET.—This lies near the last group, and also makes a capital showing of good milling ore. The ledge is large, with an ore streak which will average 4 ft wide.

THE CALIFORNIA.—On this mine they are actively at work with a shaft 10 ft deep, and the ore body continues to yield good ore, which seems to become richer the further they get from the surface.

COLORADO.

OLPIN COUNTY.—Georgetown Courier, Dec. 2: Central City shipped \$95,100 in gold bullion in October. Mr. Standley has let a contract for sinking the main shaft on the California mine, on Quartz hill, to a further depth of 200 ft. A splendid body of ore has been struck in the 800 east level of the New York and Colorado company's property on the Gregory lode. The business mining company has been formed for the purpose of working the Centennial lode in the Rutland district. The vein is situated in one of the best belts in the district.

LAKE COUNTY.—Mining operations have been resumed on the Chrysolite, Scooper mine, which went to smash under the administration of J. W. Bonta. It is now to be vigorously worked by Geo. Daly. The Dunkin mine is now shipping an average of 15 tons of ore per day. A strike is reported on the Silver Wave mine, near the base of Twin Lake creek, near Hunter's pass. The Silver Cord combination, located on Iron hill, is reported showing up very well. The Silver Wave continues in its shipments of rich ore. The Iron-Silver receipts for October were \$99,003.45, paying for 4,864 tons of ore. Expenses, \$54,194.50; profits, \$45,718.95; balance, cash on hand Nov. 1, \$164,311.97. The California mining company has cleared a dividend of \$24,000 for the shareholders, aggregating \$80,000, payable on the 15th day of December.

BOUTLER COUNTY.—Three tons and 1,384 lbs of ore from the Emancipation mine, at Sunshine, returned \$311.83. Daily discoveries of new mines are reported from the tellurium belt, Boulder county.

SUMMIT COUNTY.—The Ollagher lode, toward which a great deal of attention has been given for some time directed, is now reported to be showing up well, the new ore streak coming in at the bottom of the shaft appearing to possess great value. The Grand Goose lode will start up during the first of the week. The new camp at Battle mountain, in the Eagle river district, continues to improve, and promises to be one of the richest camps in Colorado. From Red Rock it is reported that the Herald mine, belonging to the Eagle River company, is being developed. The output from the Robinson mine has been large for the past few weeks. Ten tons of ore per day are taken from the Snow Bank. An important strike of galena and black sulphurates has been made on the Black Diamond. An important strike is reported in the Washington lode, located on Sheep mountain, midway between Robinson and Kokomo.

IDAHO.

ALTURA ITEMS.—Yankee Fork Herald, Nov. 27: John McDonald, John Wild and James Martin arrived here from Altura county last Tuesday. To the former we are indebted for the following items: The Ida Elmore mine, near Rocky Bar, is working, 12 men being employed by it. The vein is from 12 to 27 inches in width, and the ore that is being extracted is good. A depth of 220 ft has been obtained, and tunnels are being run east on it. When 100 tons are out crushing will commence. The Vishnu 100 tons are out crushing will commence. The Vishnu and Idaho have been worked under lease for the past year. They are looking well, and a New York company is negotiating for their purchase. At Atlanta things are moving about as usual. Twenty-six men are at work in the Monarch, and the ore taken out is good. The Buffalo is at work, and the company's mill is running right along. Only 15 men were in Atlanta hunting work when the gentlemen left. Last Sunday there was 2 1/2 ft of snow on the divide where the trail crosses the Saw Tooth mountains. At the Saw Tooth lake there was 6 inches. From the latter place to Bonanza no snow was encountered till within 10 miles of here, where there were 2 or 4 inches.

MONTANA.

BEUL.—Butte Miner, Nov. 30: The middle or whim shaft has attained a depth of 100 ft. The crosscut is all in ore, with streaks of rich and low grade ore. The west drift in the bottom of the whim shaft is being actively forwarded, and is stripping a fine body of silver copper ore extending all along the north side of the drift, which is now 210 ft long. Stopes will be started, and in all probability the level will be widened to the full width of the vein, which, besides being one of the richest, is also one of the largest and strongest in the camp. On the south vein, which is producing only free ore, operations are confined to the drift running west at a depth of 40 ft, and the face of which is 30 ft distant from the shaft. The product averages 30 ounces in silver and amounts to 15 tons daily. On the dump are about 250 tons of ore, 100 tons having recently been shipped to the Clipper mill. The Bell employs about 30 men, and the total daily product of the mine is about 25 tons.

MAESA CHARTER.—The ore body in the north drift has been penetrated for a distance of ft without striking the hanging wall. At this point in the explorations, a break in the machinery occurred which necessitated the closing down of the mine until the damage can be repaired. The ore so far opened up is of average quality.

STEVENS.—Operations have been resumed in the middle shaft. The face of the 60-ft west drift is in 120 ft and shows up a 2-ft body of quartz, rich, compact and clean, and lying between well defined walls. A considerable amount of first-class ore is on the dump, from which several shipments have been made to the Dexter mill.

ACQUISITION.—Considerable activity prevails in the development of this property. The stopes on the 70 level continue daily to produce about 8 tons of exceptionally high grade ore, and, as yet, scarcely a visible impression has been made on the vein. Steady shipments are being made to the Colorado smelter.

COLUSA.—The face of the east drift, which is about 340 ft from the old shaft and 100 ft deep, is being driven ahead on a fine body of copper ore, some of which is exceedingly rich.

OPHIR.—Mr. Allen is meeting with excellent success in opening up this prospect, which is rapidly developing into an splendid proposition. On the 20th of November the vein at a depth of 40 ft was found to be unmistakably dipping towards the south ledge, and at a considerable angle with the surface, it has been deemed advisable to start a new shaft on the latter. This was begun about a week ago, the ore at the surface assaying \$32.

ANSELMO.—The sinking of No. 2 shaft has been resumed from the 70 level. The new whim works well, and with it will be sunk to a depth of 250 ft by the 1st of March next.

NEW MEXICO.

ENCOURAGING.—Herald and Sentinel, Nov. 30: In the various mining districts adjacent to Silver City, new locations are made every day. The present outlook is such that encouragement meets us on every side. In Chloride Flat sinking lower and drifting in the slate formation shows the native silver between the layers of the slate, and chloride of silver still shows in fair quantities. The Bremen mines and mill are running night and day on fair ore from the Silver Flat district. One of the formations of slate appears cropping out between the lime and granite, and on claims where shafts have been sunk born and native silver have been found in fair quantities.

IN THE BURRO MOUNTAIN DISTRICT the copper locations are showing better and better every day. During the past week parties have been out examining the different claims in and about Cherry creek, and report good indications, when any work has been done, that the ore running is very good per cent copper. This district, although comparatively new, is being prospected quite thoroughly, and the results give great encouragement.

AT PINOS ALTOS development is being pushed on the various gold claims in and about Bear creek; also on other claims, showing a very good ore, containing both silver and gold.

AT SAN RITA the copper mines are being resumed, and work is being done on new prospect holes with astonishing results. In this same district other copper locations are being prospected, and from appearances, as the work progresses, this locality bids fair to stand ahead of any other in the United States.

AT OROBERTOWN the Mimbres Reduction Works have not commenced operations with their new mill, but expect to do so in a few weeks. The different mines in this locality are now being worked, and assayers are on the dumps separating and getting ready for the mill when it starts up.

This month has shown a large increase in locations in all districts over any previous month, and with the great increase of miners from other localities, the work of prospecting is going forward rapidly.

OREGON.

MINING NOTES.—Democratic Times: A great deal of mining will be done this winter, if water ever comes. The miners of Josephine county are making preparations for a bigger run than ever this winter. The miners are busy at work making preparations for winter, and will be better than ever prepared for any amount of wet weather. Bardell & Kline are unable to work their quartz ledge on account of water. They propose putting up a pump next season, and will then prospect it thoroughly. A rich strike has occurred in the Siskiyou ledge, on Humburg creek, a candle box of rock yielding \$500. Orizley Gulch ledge, on Indian creek, richer still. Eagan, located in Siskiyou county, Cal. T. L. Beck, the enterprising Willow Springs miner, desiring to work the ground now taken up by the county road in a portion of that district, is now building a new road in lieu thereof, which will be a better one than the other. He is making preparations for an extensive run of this mine, and has secured an extension of the Schumpert ledge in the Willow Springs district, has disposed of a fourth interest to Ralph S. Smith, of San Francisco, for \$100, and will immediately commence prospecting it. He proposes running a tunnel first should the ledge prove valuable. California capital will be invested in it.

POCAHONTAS NOTES.—Bedford Democrat, Dec. 5: The cold weather has closed out mining operations in this district unless it is the eternal Chinaman with his inevitable rocker. The new proprietor of the Camp Carson mine proposes that the trade from that section shall come to Powder River valley, and to that end has had several men at work on a road from that point to this for some time. S. B. Bailey is enlarging his mining ditch to a capacity of 1,200 inches.

THE Barbee & Walker Mining Co., of Utah, paid a dividend of \$10,000 at New York on the 27th ultimo.

The United States Geological Survey.

Clarence King, Director of the United States Geological Survey, has completed his first annual report to the Secretary of the Interior. It outlines the organization, numerous fields of work, the present plans of this newly-established Bureau, embodies the preliminary reports of various staff officers now engaged in active operations, and forebodes the compilation, during the coming winter, of no less than 12 volumes of practical and general geology, etc., as the results of the work already accomplished during the one and a half first seasons which have elapsed since Congress provided for the organization of the survey.

Among these volumes will be an elaborately practical, as well as scientific, treatise upon the precious metals, by Clarence King; the geology and mining industry of Leadville, Colorado, by S. F. Emmons; the history of the Comstock lode, by Eliot Lord; the geology of the Comstock lode, by Geo. F. Becker; the mechanical appliances used in mining and milling on the Comstock lode, by W. R. Eckert; the geology of the Eureka mining district, Nevada, by Arnold Hague; lesser metals and general mineral resources, by Rothall Pumpelly.

"I have so arranged the initial work of the survey," says the report, "that special volumes on the most important geological subjects and mining industries in the four western divisions of the survey shall be brought to prompt publication. There can hardly be two opinions on the desirableness of immediately working out such problems in these great districts which, in their past and present history, offer examples of instructive geological structure and great bullion yield, and which have required of mining men special mechanical skill and a large outlay of capital. Proper scientific reports on such typical districts become records of remarkable phenomena in the fields of industrial geology, and chronicles of distinguished success in the department of mining engineering. Among the great numbers of mining districts which merit rigid investigation I have chosen three, which, more than others, seem to offer harvests of technical information, of which the mining population stands in immediate need: Leadville, the extraordinary district in the middle of Colorado; Eureka, Nev., which, for 15 years has been the most productive silver lead district in America; and the incomparable Comstock lode are chosen as the first three districts to be illustrated by special monograph."

Further on in this preliminary report the Director remarks that, although foremost among all nations in the production of precious metals, ranking first in resources of petroleum, coal and iron, and abundantly endowed with nearly every mineral substance demanded by the civilized arts and sciences, the United States has conspicuously failed to gather and publish systematic statistical knowledge of the yearly mineral productions. He adds: "It is estimated that the mere raw products of the mineral industries do not fall far short of four hundred millions of dollars annually, and it requires no gift of extraordinary foresight to reach the conclusion that a few years will bring the yield to a thousand millions. Until congress extends the field of geological survey over the region east of the 100th meridian, this Bureau will confine its own operations in the department of Mineral Statistics to the industries of the far West."

He says an appropriation of \$50,000 per year will be sufficient to carry on all the work that is desirable over the whole United States, and submits that so small an appropriation as this would not be an excessive contribution toward the development of so vast a field of American enterprise.

THE GUADALUPE SALE.—The property of the Santa Clara mining association of Baltimore, was sold by the Sheriff, at San Jose, on Tuesday, to satisfy judgments of the Santa Clara Valley mill and lumber Co. and the Bank of California. Before the sale a protest was entered on behalf of the San Francisco creditors, whose claims amount to about \$40,000. The judgment of the Bank of California is for \$134,000 and that of the mill and lumber company for \$5,100. But few persons were present except those immediately interested. On the property first put up there was but one bid, that of the Bank of California, the offer being \$37,157.92, at which it was struck off. The adjoining property was then sold on behalf of the lumber company, B. P. Rankin being the purchaser for \$5,100. This property is the famous Guadalupe mine. Mr. B. B. Thayer, the superintendent, worked it up into a first-class mine. All the works, buildings etc., were of the best character. It was closed down last June, but will probably be worked again when legal difficulties are over.

THE INDIAN CENSUS.—A Washington dispatch says: The attempt to take the Indian census by the patriarchal plan met with great obstacles. Special agents notified census officials that, owing to the Indians scattering and their superstitious reluctance to give the names of themselves and families, they have been unable to make any headway yet among the savage tribes, and must have more men and money. Secretary Schurz directed the Indian agents to assist in the matter, but they do not seem to have obeyed very effectively. It is not expected to have any reports in this year, and it appears the attempt to take families by name will have to be abandoned.

Harvesting Cinchona Bark.

Concluding the subject of cinchona culture, which we began Nov. 20th, we give below an engraving to show one of the methods by which the bark is obtained without destroying the tree. In South America, barks of all sorts and ages are collected indiscriminately, and in such a way as to kill the trees; such a system was evidently inadmissible in the case of cultivators. One of the improved plans is known as "mossing," and is illustrated herewith. Two parallel cuts, *c*, are drawn down the stem, the strip of bark, *a*, included between them is then raised from the incisions, and pulled off carefully from the bottom upwards, great care being taken not to injure the *cambium*, or sappy matter, left in the hollow; immediately the bark is removed, a thick coating of moss, *b*, is honed around the wounded stem. By this process, the *cambium* granulates, and forms a new bark. It is essential to observe that the moss is free from lichens. The strips of bark removed are about 1 to 1½ inches wide; such a number are taken as the tree will afford, leaving intermediate strips of somewhat greater width. At the end of 6 to 12 months, the bands left in the first instance are taken in the same way; in 12 to 22 months, the parts first stripped will be covered with new bark ready for re-stripping. The advantages claimed for this plan are that a crop of bark equal to half the total trunk-bark of the tree can be taken annually, without damage to the tree; and that this bark is richer in total alkaloids, and especially in crystallizable quinine, than natural bark. It appears, however, that this increase of total alkaloids is not observable in the renewed bark of trees at the maximum yield (over 3 years); but the proportion of quinine is augmented, and the value of the bark as a source of pure quinine is there-

"Mossing" the Cinchona.

by raised. The enrichment of the renewed bark is said to be at the expense of the bark outside the mossed region; and it is said that renewal is prevented, or much retarded, by the least injury to the *cambium*. Further, the cropping cannot be depended upon often more than once in 2 to 3 years; and this rapid cropping tends to shorten the lives of the trees. Finally, the operation can only be performed when the air is quite moist, and therefore at a time when the bark can least easily be dried. In some instances, too, the plan has been frustrated by the renewing bark being devoured by ants, who found an asylum in the moss. On the other hand, a number of trees which were left bare (unmossed) after the harking, renewed their bark fairly well. When sufficient supplies of moss cannot be procured, as for instance in Coorg, a substitute is found in detached leaf stalks of the plantain, and the leaves of wild cardamom, or of ginger. These should be applied in a dry state, and not with a smearing of clay, as has sometimes been done.

Mining Dividends.—The following local mining incorporations declared dividends last month:

Deadwood Mining Company, 25 cents per share.....	\$ 25,000
Eureka Con. Mining Co., 50 cents per share.....	25,000
Golden Tyra, 25 cents per share.....	25,000
Homestake Mining Co., 30 cents per share.....	30,000
Homestake (extra div), 30 cents share.....	30,000
Idaho Mining Co., \$5 per share.....	15,000
North Bloomfield Gravel Co., \$1 per share.....	45,000
New York Hill Mining Co., 20 cents per share.....	10,000
Northern Belle Mining Co., 50 cents per share.....	25,000
Ontario Mining Co., 50 cents per share.....	50,000
Silver King Mining Co., 25 cents per share.....	25,000
Standard Con. Mining Co., 75 cents per share.....	75,000
Western Mining Co., 75 cents per share.....	75,000
Watt Blue Gravel Mining Co., 7 cents per share.....	7,000
Total.....	\$425,000

Of the above, the Watt Blue gravel makes its first appearance on the dividend list. The North Bloomfield has not paid a dividend for a long time, though this is the sixteenth one of the company.

Eureka District.

Outside of two mines in Eureka district, says the *Sentinel*, the thought often recurs to the practical miner—who is acquainted with the history of the camp—as to where a test has been made of the value and extent of the ore channels from whence is to come our future wealth and prosperity. Where has a trial been made by which we can approximate the worth or permanence of any portion of the district? The magnificent results of mining, so far, in the output of precious metals which has made the name of Eureka mining district famous, has only been done through the developing of our innumerable prospects. In numberless cases we could cite where owners have made several thousands, they have spent it, being generally of that class of frontiersmen who believe in getting their "money's worth" of such enjoyments as offer. The consequence was, that when the pinch in the ore vein was encountered, these owners were flat on their backs financially, and the good fortune which they had met with had unfitted them for the steady perseverance which had attended their first endeavors. Take, for instance, the Geddes & Bertrand. To the owners it was merely a summer's work to make hundreds of thousands in bullion, transfer it to coin in the fall, and spend the winter in riotous living, either in San Francisco, or New York. At last there was a "faunt" in the body or crevice, and a summer's work left the proprietors in debt. That was out of the programme, and there the mine lays. The Geddes & Bertrand is but one in a hundred we could mention in this district.

What we need is heavy machinery, deep shafts, long drifts, and the working of many diamond drills, and Virginia City in her palmy days, could not boast of more wealth and more prosperous times than could Eureka.

It requires corporate bodies with heavy capital to prospect this section as it should be, and till schemes are under consideration to sink, in various portions of the hill, deep shafts, or bore to test the formations which underlie the shallow workings of the present day, we may expect no boom, though we may hold our own for several years to come. The test will come in due time, and will be prosecuted to a definite result. At present the real knowledge concerning our mineral deposits is limited. And it is equally as well understood that those mines which have been developed have to-day unknown and unprecipitated large bodies of high-grade ore at hand and ready to break down. This knowledge of the developed properties makes the question of our future of more than passing importance.

No district offers so important inducements for large enterprises. It has been proven, no temporary field for limited operations.

Some time ago we noticed in a mining review, that the suggestion of co-operation was advanced in camps where capital had not become interested, and among our many mine owners, we cannot see where harm would follow for them to adopt the same. One mowder cuts hay for several ranches in Huntington valley; the machinery on one mine could be utilized in developing half a dozen adjoining properties, rather than he idle because of the ore body having pinched out in the "feet" which belong to the mill and mining company. Large schemes of co-operation, and a gradual tendency toward mutual assistance, would produce the most favorable results, on small capital, if applied to the mining interests of this district.

We know the foundation upon which our people stand, and what we are to work for. It is no "promise" of reward for those who expend money and labor.

One great drawback to this district has been the expensive treatment of ores. We now have competition, and will soon have more. But in the main, though our ore is rich and is often found in large quantities, still the cost of extracting, of transportation, of charcoal and its transportation, the shipping of the bullion, all this and all that, tells heavily, even on the best of mines. The reason why capitalists are easy to become interested in New Mexico, Colorado and Arizona at the present time, is because they have good mines there; the Eastern people have flooded the country, and labor is cheap; charcoal can be had in abundance for from 8 to 12 cents per bushel; the *greases* raise, almost without labor, any quantity of vegetables and everything is cheap, while their silver production, even though less, is of as "good quality," as ours.

Thus it appears that we of Eureka district must arise and unite for active work; either offer remarkable inducements to outside capital, or concentrate to prove our richness in the deep workings of at least some properties other than those which are known the world over.

NEVADA'S POPULATION.—Jackson Ferguson, Supervisor of the census for Nevada, has completed the returns, though the official figures have not yet been published. He states that the total population of Nevada is within a hundred or two of 60,000, showing a gain over the last census. Instead of losing, Storey county has gained, its present population being between 16,000 and 17,000 an increase of 4,500.

The Calumet and Hecla copper mine of Michigan has produced 16,233 tons copper during the first 10 months of the year. This is within 96 tons of the total product for the whole of the year 1879.

Hats from the California Fan Palm.

Mrs. N. W. Winton, Secretary of the Santa Barbara Horticultural Society, has sent us some samples of hat-braiding, the material being derived from the leaves of the California fan palm (*Washingtonia filifera*), which grows wild on the Mohave desert, and has been introduced as an ornamental plant in gardens all over the State. The utilization of the leaves of this plant as a fiber for braiding seems to have originated with Mrs. Joseph Sexton, of Goleta. Santa Barbara county, and the specimens of her work sent us by Mrs. Winton are quite handsome, and show the strength and beauty of the material employed. Mrs. Winton has prepared for the Santa Barbara Press, an account of the way such fibers are prepared for braiding, illustrating the practice of the Panama straw braiders, who use a different kind of plant (*Carludovica palmata*), but which has a leaf similar to that of a palm. The leaves are gathered before they unfold, as in the case of our palm, and in preparation the ribs and coarser veins are removed, then the leaf is cut in shreds. It is said that in New England large quantities of this palm are imported and worked up at the homes, with profit, despite the distance the material is brought; and it is at this point that their mode of stripping comes in for our aid. Their method is to prepare a board, with a row of sharp knives on the edge, and drawing the palm over this strips it into uniform shreds. These strips for the Panama hats are exposed to the sun for a day, and then tied into a knot and immersed in boiling water. This process whitens them, and after drying in the shade they are bleached for several days with sulphur. These preliminary processes are carried on at headquarters, and then distributed to the natives for braiding, which is done on a block of wood held firmly on the lap.

The palm fiber exceeds in durability any known article—it will not break, but only wear out in process of time, and Mrs. Winton rightly concludes that they will always be at a premium with mothers, one of the unsolved problems of whose life is, to keep whole hats on a family of irrepressible boys. One of the essential elements of the happiness of a boy's existence will be destroyed if he cannot manage a ventilator or two in his painfully new straw hat. A palm fiber hat is warranted to stand service as hat for a ball; a basket for eggs, fruit and rocks, and any modern convenience desirable for the masculine juvenile.

Mrs. Winton also mentions the manufacture of fans from the leaves of our fan palms. For fans, several of the *Chameroops* *C. humilis*, *C. palmata*, *C. excelsa*, etc., are used. These are prepared by trimming and bleaching, wiring and binding; and grow freely here. Mrs. Winton saw them in South Carolina forests, and was informed that they were cut and sent North for all the work upon them; an example unworthy of our imitation. No country can prosper without a multitude of small interests as well as large. About two leaves per month can be cut from one plant. The California fan palm grows well in nearly all parts of the State, even as far north as the snow line. Those who have the plants may be interested in home experiments in braiding the fibers.—*Rural Press*.

POPULATION OF ALASKA.—The enumerator who was sent out last May to take the census of Alaska has returned to Washington. He traveled to Alton, the extreme western point of the Aleutian islands, northward to Norton sound, up the Yukon river, 900 miles overland and by canoe to Kodiak, getting all the population west of Sitka and north of Prince William's sound. The population of the southeastern portion of Alaska was to be taken by a deputy, who has not yet reported. The population of Alaska, as far as reported, aggregates about 22,000, of which about 18,000 are Indians, 1,300 Aleuts, 1,500 Creoles, or mixed Russian and Aleut, 128 white males and 4 white females. The largest population in any one center is at Kodiak and the adjacent island, where there are about 2,200 persons, principally Indians, Aleuts and Creoles, with a few whites. In addition to the above population in Alaska, Captain Smith, ice pilot of the revenue steamer, *Corwin*, counted 2,200 Esquimaux between Behring strait and Point Barrow. It is estimated that Alaska contains about 30,000 human beings, of which, possibly, 300 are whites.

An old idea in a somewhat new form has turned up at Kiel, Germany, where a trial was made recently with a so called "hydro-motor ship," built after the plans of Dr. Fleischer, of Leipzig. The vessel, which is 17 ft. beam, 110 ft. long, 5½ ft. draft and 100 tons burden, made 10 knots an hour. She is propelled by the force of hydraulic reaction, without the aid of either paddles or screw. The water passes into a reservoir in the hold through holes in the bottom, and is thence pumped out and emptied into the sea by a centrifugal pump worked by the ship's engine, the discharge of water propelling the vessel. The engine discharged 5,000 gallons per minute, and is said to have furnished a stronger propelling power than screw or paddle, while the motion was without jar and as gentle as sailing. The ship could be stopped, backed or turned instantly, so as to be free from all danger of collision. Indeed, a vessel thus propelled, it is stated, can be made to revolve in a circle about its own axis.

THE ENGINEER.

Progress of Engineering in America.

Until the close of the last century, natural power had over been employed in its most primitive forms. Wind and water were the only motive powers called in to aid man in his labors; and the appliances to utilize them were of the simplest possible character. It is true, some great engineering works were undertaken and completed; but only at large expenditure of mere labor and muscle. But with the introduction of steam, in 1778, a new wide field was opened up for the exercise of the genius of the engineer and mechanic. The invention of Watts was a triumph which set men to thinking, and its successful application contributed more to the prosperity and welfare of nations, and the advancement of science and mechanism, in the next succeeding century, than had been achieved by the united efforts of all previous time. Perhaps in no part of the world has it given birth to greater activity, or accomplished greater triumphs, than in the United States.

At a late meeting of civil engineers in St. Louis, a very interesting paper was read by Mr. O. Chanute, summarizing the progress and wonderful growth which engineering has made in this country, and alluding to the high position which the United States has attained among nations. From this paper we briefly summarize as follows: In the matter of supplying towns with water, the application of steam as a power, and the improvements made in pumping machines, engineers have made a gain of 50% over what was accomplished 20 years ago. There are now 569 towns and cities in the United States and Canada supplied with water works, involving 13,000 miles of pipe, 10,000 of which is of cast iron. Important progress has also been made in canal engineering; and we now have 3,257 miles of canal.

Experiments are in progress in the way of steam propulsion, which it is confidently expected will effect a saving of fully 37% over present methods. In railways, Americans were among the first to appreciate Stephenson's inventions of 1828, and are foremost among nations in utilizing it. The United States leads the world in the extent of her lines, reaching 86,000 miles; all Europe has but 90,000, and the balance of the world only 25,000. Our railroad engineers and locomotive builders lead all others. Our roads reach farther and cost less than any others, and our engines pull heavier trains and run more miles in a year, or during their lifetime, than those of any other nation. The Pennsylvania railroad was pronounced one of the best, if not the best, managed railroad in the world. [The present writer would name the Baltimore and Ohio as the only road whose management can be pronounced either equal or superior to that of the Pennsylvania.] In regard to bridges, there are now in the United States 900 miles of these structures—one-third of them stone or iron, and two-thirds wood. [The East river bridge, at New York, may be instanced as the holdest conception of bridge construction ever attempted.] The matter of river improvements is just now attracting much attention, and the fact is being realized that, until quite recently, but little has really been done in this direction. It has been demonstrated that the currents of the largest rivers may be controlled by simple brush dikes. The movable dam on the Ohio—a French idea—has already proved a success, and the best engineering talent in the country is now engaged in effecting certain needed modifications required to meet the peculiar nature and needs of our rivers. The recent improvements to navigation at Hell Gate and Flood Rock were referred to as great and novel feats of engineering. In telegraphic and gas engineering, we have made wonderful strides. In the former, we lead the world; in the latter, since 1850, the number of companies has increased from 50 to 900, with a capital of \$200,000,000. In metallurgy, the increase of our blast furnaces is especially notable. In the amount of iron produced, we are next to England, Germany standing third. Our steel industry, which is now second only to that of Great Britain, will exceed that country in another year. Our increase has been 50% in two years. Our mining industry, especially in regard to the precious metals, is simply enormous. The petroleum industry was briefly alluded to. Our exports of that product are now the fifth on the list in point of value. In agricultural engineering, our progress has been truly wonderful, and hence this all other branches become as dust in the valley. In the plow alone the annual saving of labor in producing our crops amounts to fully \$36,000,000 less than the same work would have cost 30 years ago. It is in ship-building and maritime trade alone that we have lost ground during the last two decades. This decadence is attributed to the war of rebellion, and to unequal competition with England in ship-building, and the superiority of iron over wood—an industry to which our engineers and capitalists have not given proper attention; but it was confidently predicted that in the early future we shall once more assume our proper place on the ocean.—*Californian*.

THE medicinal rule is that an elevation of 4,000 ft. above the level of the sea confers immunity from yellow fever.

USEFUL INFORMATION.

POLISHING AND FINISHING METALS.—The following directions, which will frequently be found useful for finishing and polishing steel and iron, are given by *Forge and Lather*: To get the beautiful finish we see on the best work, a piece of flour emery paper, well worn and a little oil upon it, will be found the best thing to use, and when this has been well worked to get the high polish, a piece of wood flat upon the surface, with some fine crocus will bring it up to this state; and if any deep scratches be there you will at once observe them, and to remove them, in all probability it will have to be filed over again. The scratches must be removed before any attempt is made to polish. There are several ways of ornamenting the work if you do not wish it to be left straight. First, then, to cross the surface. This is done by folding a piece of emery paper tightly round a file, taking a kind of circular action, by doing which each line becomes, so to speak, connected. Another process of finishing steel is to curl all over the surface with a piece of oilstone that will cut. This is a most difficult thing to obtain, as few stones cut without leaving bright marks. Hold it firmly in the hand, moving it about in all directions like curling brass. There is no stated number or size of the curl. Another way of finishing iron and steel is with the scraper, which is used with both hands, and the work must be scraped in various directions, but with regularity.

COMPRESSING FLUID STEEL.—A proposal has lately been made to effect the compression of fluid steel, by placing in the ingot mold on the top of the fluid metal a charge of soda or other solid which evolves gas on being heated; the top of the ingot mold being then closed, and the pressure due to the gas generated being allowed to act on the fluid steel. This mode of operating was first started by M. Antoine Galy-Cazalet, of Paris, some 13 years ago, who proposed to use a mixture of 80 parts of soda with 20 parts of charcoal, the mixture being introduced through a cock fitted to a cap affixed to the head of the ingot mold. With a space of 30 cubic inches capacity between the fluid metal and the ingot mold cap, the introduction of $\frac{1}{2}$ oz. of the mixture is stated to give a pressure equal to that of a head of metal 90 ft. high.

TO KEEP LAMP CHIMNEYS FROM CRACKING. The following recipe for keeping lamp chimneys from cracking is taken from the *Diamond*, a Leipzig journal devoted to the glass interest: Place your tumblers, chimneys or vessels, which you desire to keep from cracking in a pot filled with cold water, add a little cooking salt, allow the mixture to boil well over a fire, and then cool slowly. Glass treated in this way is said not to crack even if exposed to very sudden changes of temperature. Chimneys are said to become very durable by this process, which may also be extended to crockery, stoneware, porcelain, etc. The process is simply one of annealing, and the slower the process, especially the cooling portion of it, the more effective will be the work.

BORAX TO PREVENT MILDEW.—We understand that experiments lately made by Whewell, of Blackburn, on the employment of borax for preventing mildew in cotton goods, show that it cannot be employed with flour paste, as it turns the paste yellow. It can be used with advantage with farina, as it does not color the paste, and also increases its tenacity. A six per cent solution can be employed, which, at the present price of borax, namely £65 per ton, is equal to about £4 per ton.—*Textile Manufacturer*.

HUMAN POWER.—At a late national trial of hand fire engines, Prof. Hartig made some experiments on human power for short intervals. The engines were worked by foot soldiers, on a warm day, and under an exposure to the direct rays of the sun. The mean velocity of the handles was 5.81 ft. per second; the mean value of the effective work for each man, 163.32 ft.-lbs. per second; or about 4.1 times the value which Morin and Weisbach assumed for the average of eight hours continuous labor.

A DRY coating for basement walls may be made as follows: Take 50 lbs. of pitch, 30 lbs. of resin, 6 lbs. of English red and 12 lbs. of brick-dust. Boil these ingredients, mix them and stir thoroughly, then add about one-fourth the volume of oil of turpentine, or enough to make it flow easily, so that a thin coating may be laid on with a whitewash or paint brush. Walls thus coated are proof against dampness.

CATHEDRAL CARVING.—It is said that the fine and various carving into which old cathedrals blossom at every corner, where a piece of fantastic ornament could find a foothold, is partly due to the interest which the workmen took in their labor. They carried home stones, and in their leisure hours wrought out whatever design seemed best to them. It thus became a labor of love.

AMERICAN cotton helting is now, it appears, obtaining more appreciation in England. Mr. Kirkaldy, the well-known expert, has made some tests recently, and has found that a 3½-inch cotton belt broke under a load of 4,187 lbs., while an English leather belt 4 inches wide was broken at 2,000 lbs.

WHY A PUMP WILL NOT LIFT HOT WATER.—The suction pump depends for its action on atmospheric pressure. When the piston of such a pump is raised, a vacuum is formed beneath it, and the water from the well or reservoir is forced to follow the piston up to the top of its stroke, by the atmospheric pressure on the water surface with which the pump is connected. When the attempt is made to lift very hot water, however, the rise of the piston causes an abundant evolution of steam or vapor from the water surface, which fills the space beneath the piston. This steam or vapor has considerable tension, and exerts a sufficient back pressure to counterbalance and equalize the atmospheric pressure. On this account, the lifting of hot water, save for very small lifts, is impossible. When hot liquids are to be pumped, therefore, the point of supply should not be below the pump, but rather a little above it, so that the liquid may flow into it.

FOR DOG'S DISTEMPER AND FITS.—The best and most positive cure is said to be as follows: Give the dog one ounce of syrup of huckthorn, just one week after give him another ounce, and one week after the second, give him the third ounce, and he will be cured. For fits the best thing to give is gunpowder and milk, well mixed, given to the dog two or three days in succession; from two to four tablespoonfuls each day, or until he is thoroughly physicked; an over-dose will not hurt him. The cause of fits is feeding too much meat and too little exercise.

TO MAKE CORKS AIR-TIGHT AND WATER-TIGHT.—A German chemical journal commends the use of paraffine as the best method of making porous corks gas and water tight. Allow the corks to remain for about five minutes beneath the surface of melted paraffine in a suitable vessel, the corks being held down by a perforated lid, wire screen or similar device. Corks thus prepared can be easily cut and bored, have a perfectly smooth exterior, may be introduced and removed from the neck of a flask with ease and make an absolutely perfect seal.

SOLID MUCILAGE.—Mucilage in a convenient, solid form, and which will readily dissolve in water, for fastening paper, prints, etc., may be made as follows: Boil one lb. of the best white glue, and strain very clear; boil, also, four oz. of isinglass, and mix the two together; place them in a water bath—a glue pot will do—with $\frac{1}{2}$ lb. of white sugar, and evaporate till the liquid is quite thick, when it is to be poured into mold, dried, and cut into pieces of convenient size.

GOOD HEALTH.

Cure for Whooping Cough.

A correspondent of the New York *Sun* writes as follows from actual experience and from observation:

It is well known to most intelligent people that exposure of patients to the vapors arising from the purifying boxes in the gas works almost invariably relieves the terrible paroxysms, and, after repeated visits cures have been frequently effected. This discovery was made by a physician of Paris, about 15 years ago.

The fact was published, and soon after visits began to be made to the Manhattan, New York, Brooklyn, and other gas works on the recommendation of our medical men. An epidemic of whooping cough raged in Newport in the winter of 1878. Over 200 patients, between the ages of two months and 75 years, visited the gas works. The Treasurer of the company, William A. Stedman Esq., states that nearly all were benefited, and some were undoubtedly cured.

About that time the child of a distinguished chemist in Providence, R. I., was seriously ill with this terrible disease, and too weak to be taken to the gas works. The father procured a quantity of the liquid hydro-carbon deposited by condensation in the bottom of the purifying box, and vaporized it in a metal dish in the closed room of the little sufferer. Almost immediately it revived, and spasms were checked and after a few days the child recovered and was as well as ever.

Microscopists have recently discovered that the cause of whooping cough (pertussis), is the rapid aggregation of bacteria under the root of the tongue. These must be destroyed before relief can be obtained. To this end such powerful medicine as quinine bromide is given; but even that fails to reach the seat of the disease. Of course the ordinary expectorants are absolutely useless; change of air is rarely curative; hence the rapidly increasing percentage of deaths from this disease.

The New York Board of Health report for 1875 has a list of 489 deaths from whooping cough in that city. The deaths weekly in London, England, are from a minimum of 60 to a maximum of 220, over 6,000 annually.

Physicians generally inform the anxious parents that whooping cough must take its course, as a remedy is unknown, and they can only slightly relieve it; that the incubation and increase in virulence will occupy six weeks, and from six weeks to six months will be required before it is entirely removed. The whoopings usually increase regularly in number from day to day to the fifth week, often equalling 40 times in 24 hours. Very rarely is this disease

preceded by any other, but so great is the strain upon the system that frequently it is followed by pneumonia, in which event death often ensues. A fatal termination is more generally the result of absolute physical exhaustion due to the great strain consequent upon the oft-recurring paroxysms.

A few years since my youngest child, never before ill, was stricken by this dread disease. The best medical talent was obtained, every known remedy tried, most watchful care constantly exercised, but without the slightest avail. The child actually coughed itself to death. With all the grief of this sad experience still fresh, in April, 1879, we were alarmed by a new incursion of the destroyer. Our children, five and seven years, were attacked, seemingly with the severity of the preceding case.

It was then I learned of this Providence chemist's discovery, and that simple but ingenious apparatus had been invented by which the hydro-carbon, (by analysis found to be cresole $C_6H_5CH_3O$) could be evaporated in a closed room. I immediately procured both. The apparatus is a metal stand six inches high, supporting a cap, holding half an ounce of cresole. The heat is applied either by a petroleum night-lamp or gas, vaporizers being made to attach to an ordinary gas-burner.

Cresole is a rose-pink liquid, with a boiling point of 397 degrees. It is not unpleasant in odor, but, on the other hand, is extremely grateful to any one with the least bronchial or catarrhal affection.

In three minutes after the lamp was lighted the vapor of the cresole was diffused in every part of a room 15 by 20 ft. In ten minutes the children manifested evident relief, recovered from their dull exhaustion, and were playing on the bed, even laughing aloud in their evident freedom from the paroxysm.

I was not advised that it could be continued in safety all night, or even day or night, and at the expiration of fifteen minutes extinguished the lamp. The children had been whooping 20 times a day. One of them did not even cough for 12 hours, and the other for 36.

Learning that the vaporization could be continued day and night with more rapid benefit, I applied it for five nights in their sleeping-room. The spasms ceased and they speedily recovered.

At that time an epidemic of whooping cough was raging in my vicinity. I advised my neighbors of this apparatus. Many of them were used, and with the best results.

I believe the vaporizers and cresole are now to be obtained from druggists. I am confident it will be found equally efficient in all throat and lung diseases. Inhalation is the true mode of treatment. The apparatus is nearly perfect as an agent for deodorizing, disinfecting and perfuming not only the sick-room but an entire house. It deserves an extended trial.

ORIGIN OF DIPHTHERIA.—Diphtheria is believed to have originated in Egypt more than 2,000 years ago. It prevailed in Egypt and Asia Minor, to which it extended, during the first 500 years, and hence was early called Egyptian or Syriac disease. Having invaded Europe, the disease appeared in Rome, A. D. 330; and being akin to the plague, of which it may be a remote modification, having had the same origin, with some similar characteristics, and being like it and malignant typhus, highly contagious, the disease in its 1,500 year's transit on the continent of Europe, affected mainly rural districts and garrisoned towns. It had extended to Holland, in which it was epidemic, in 1337; to Paris in 1576, and appeared in 1771; having prevailed more extensively in France in 1818 and 1835, and in England and the United States from 1856 to 1860 and more or less since. In both city and country more cases have occurred, other things being equal, in warm autumnal and winter weather in damp localities, where the air is almost destitute of ozone, a powerful disinfectant, and being saturated with moisture is in a low or negative electrical condition of the nervous system, and correspondingly diminishing vitality, in those predisposed to the disease. Damp air also, doubtless, by diminishing the cutaneous exhalation, and otherwise, may increase the predisposition to this as well as other kindred diseases.

CHILDREN SMOKING TOBACCO.—The *Christian Union* points out the pernicious results of smoking by young persons. It says:

In one of the schools of Brooklyn a boy 13 years old, naturally very quick and bright, was found to be growing dull and fitful. His face was pale, and he had nervous twitchings. He was obliged to quit school. Inquiry showed that he had become a confirmed smoker of cigarettes. When asked why he did not give it up, he shed tears and said that he had often tried but could not. The growth of this habit is insidious, and its effects ruinous. The eyes, the brain, the nervous system, the memory, the power of application, are all impaired by it. "It is nothing but a cigarette" is really "It's nothing but poison." German and French physicians have recently protested against it. And a convention of Sunday and secular teachers was recently held in England to check it. It was presided over by an eminent surgeon of a Royal Eye Infirmary, who stated that many diseases of the eye were directly caused by it. Parents, save your children from this vice if possible! Do not allow them to deceive you. In future years they will rise up and hless you for restraining them.

The Week.

The rainy weather of the past week has been gladly welcomed. The prospects are that this year will be an unusually favorably one for hydraulic miners. The storms were late in beginning, but they have done good service so far. In the mountains the Nevada Transcript says an advantage for this season is that the snow now lies fully eight ft. deep on the water sheds of the reservoirs in the mountains, whereas the early part of last December it did not get more than a couple of ft. deep. Unless the weather becomes unusually cold, the miners will have all the water they can find use for till late next summer.

We notice that the Bodie papers are urging a consolidation of several mines so as to insure more economical working. This is but following out the principle tried on the Cumstock, and successfully, too.

The Comstock papers are also urging an "Eastward movement." They want a shaft started at the extreme north end which will do for it what the Forman shaft will do for the mines interested in it.

The week has been marked by the re-assembling of Congress. The President's message has been laid before the country, and it gives the fullest evidence of the reign of general prosperity at home and peace abroad. Indeed we live in a good land and in a good generation, and our alone is the blame if we do not advance, each according to the measure of his powers, in all good work and life.

THE promoters of the International Exhibition of Electricity in Paris next summer say that the voluntary subscriptions greatly exceed the 50,000 francs demanded by the State as a guarantee.

The Mouth Blowpipe.

It is probable that among the readers of the MINING AND SCIENTIFIC PRESS are many youths of an inquiring disposition, who, while having some leisure time on their hands, are more or less interested in matters pertaining to mining and metallurgy. To such the PRESS suggests the study and practice of the use of the mouth blowpipe, as a pleasant, cheap and highly profitable occupation for a portion of their spare time. Not only does the blowpipe afford an efficient and economical means of ascertaining the character and constituents of a vast number of mineral and of many organic substances, but it is also capable, in skillful hands, of being applied to the determination of the economic value of many metalliferous ores, fuels, etc., and that with a degree of accuracy which always surpasses those who are unacquainted with the subject.

It is true that many gentlemen who are perfectly qualified to write "assayer" after their names, as well as some who have no just title to append more than the first three letters of that designation to their patronymics, affect to deride the idea that the quantitative assay with the blowpipes can have any practical value; but in the opinion of the writer that only implies, either that they have not chosen to take this trouble to study the matter, or that they are disqualified by reason of some physical peculiarity affecting their delicacy of touch, or accuracy of vision, from carrying the operations to a successful issue.

Probably not a large number of our California youth will ever inscribe their names higher on the roll of scientific fame than have such men as Gahn, Harkort, Plattner, Berzelius, Rose and a score of others; yet all these great men attached a high value to the blowpipe as a means of making quantitative analyses, while several of them devoted a good deal of time to perfecting the methods of quantitative assaying with the same instrument. No one can even glance over the pages of Plattner's work on this subject, especially the later edition by Richter, without being amazed at the multitude of useful and interesting results attainable by means so apparently trivial.

It is true that a great many of the operations described in the work mentioned require a certain amount of aid from the use of liquid reagents, but not only does this fact not militate against the truth of the general proposition here affirmed, but even if we set entirely aside all consideration of liquid reagents, there still remains a vast and valuable field for study and experiment.

Not the least of the recommendations of the blowpipe laboratory is its comparative cheapness. With a blowpipe, a lamp or candle, half a dozen turned wood pill boxes filled with inexpensive materials, a knife and some pieces of charcoal, many useful and entertaining hours may be passed. These will not cost \$5. Add a short piece of platinum wire, a few glass tubes and watch glasses, a spirit lamp, a lens, a toy hammer, an ounce of nitric acid, and another of hydrochloric acid, costing only \$2 or \$3 more, and the field is enormously enlarged; and when we contemplate a complete set of Plattner's blowpipe apparatus, costing about \$125, we perceive before us an expanse of possibilities from which any ordinary intelligence may well recoil in dismay.

Another advantage of the blowpipe methods is, that they can be pursued with little or no instruction, other than such as may be derived from books; and the writer will promise any young man of ordinary intelligence, and having a clear, though slight, knowledge of the fundamental principles of chemistry, that if he will work faithfully and conscientiously through Richter's edition of Plattner's he will be a better practical and theoretical chemist at the end than nine-tenths of the students of chemistry who receive their instructions from university professors. Not, however, that such instruction is undervalued, but because that which is learned by the student's unaided exertions, and without even the semblance of coercion, is sure to be well learned.

There is yet another, though a minor advantage derivable from a course of practice in the manipulations of the blowpipe laboratory. It is that the student learns that perfectly satisfactory results can, in very many cases, be obtained from very small quantities of substances, even in quantitative determinations, but especially in those which are merely qualitative, so that he comes to avoid that reckless extravagance and waste which too often characterizes the use of reagents by students.

But many who are not competent, or who do not desire to push their attainments into the domain of pure science, may nevertheless acquire a knowledge of the directly useful and practical application of the blowpipe, in the discrimination of the commoner ores and minerals, and in the quantitative assay of ores of gold, silver, copper, lead, tin, iron, nickel, cobalt, etc.; and as an extensive apparatus is not needed for these purposes, while many young men are not in a position to procure it, the writer will, perhaps, in a future article, point out the means by which any reasonably ingenious and industrious youth may provide himself, at little cost, with all that is necessary. In the mean time, as the holidays are at hand, when it is usual for elders to testify their appreciation of talent and industry in youth, by means of presents, it may

be suggested that, in many cases, no more useful, appropriate, or acceptable gift could be offered to a young man, or a bright boy, than a copy of "Plattner on the Use of the Blowpipe," accompanied by such apparatus, of which there are many grades in the market, as is consistent with the pecuniary means of the giver.

Manufactures and Interest.

Just now the attention of the public is drawn prominently in the direction of home manufactures. California is not as prosperous as her sister States just at this moment, and we are beginning to think that we must establish manufacturing to work up our raw material. The question is, whether we can do this under the conditions existing here at present. Theorizing is all very well, and "general principle" statements sound nicely. But have we the men among us with the nerve to put their money into manufacturing and take it out of the old grooves where it earns interest without responsibility.

The truth of the matter is, that our California capitalists have, in the way of manufactures, done very little. They have never taken any risk. They let the poor man do that. In other countries, capitalists start up an establishment, put in their money honestly, and go to work. If this thing fails, they lose their money; but if it succeeds, they are gainers. They take ordinary business chances, of course.

With us it is different. A man or a few men want to start up a manufacturing establishment, and must rent premises or put up buildings, and buy machinery, and have some means to start in on. With the necessary knowledge of how to accomplish their object with the works prepared, they haven't the money to prepare them. They therefore go to the capitalist. He does not ask them how many men the project will give employment to, nor how much they can make per annum. He asks them what security they can give for the money. He doesn't propose to go into any manufacturing institution with his money. He wants, simply, to lend it. If they can give good security and pay good interest, all right; if not, they may say good-morning.

Now, there is more truth than poetry in this statement. Nearly every man who has started in at a manufacturing business here has had the same experience.

The consequence is, that the manufacturing establishments of California are fewer than they should be. The capitalists are more money lenders than anything else. Another result is, that what institutions there are in existence, are on a smaller scale than they should be. Persistent men go to work with a desire to build up a business, and those who can't give security must do the best they can, or give up the idea.

It is the poor man who takes the risk in all these transactions. He has got to run the works, take all the responsibilities and chances, and the risk of failure. The capitalist sits in his office and draws the interest. If it does not come promptly, he shuts down, and that is the end of the works. He loses nothing. It makes no difference to him.

Those who have had the temerity to go into manufacturing here have always had to fight their way against older established institutions East. They have had to overcome the absurd prejudice against home productions. They have had to pay higher wages than their competitors, and higher expenses also. But the worst fight they have had is with high interest. When they overcame all other obstacles, there stood the interest in the way. The man supposed to be their "hacker" and helper financially, is the man drawing the life blood from the institution in the shape of interest. He is the "Old Man of the Sea" on the shoulders of the business, hearing it down.

We must not expect to make any advance in manufacturing here until these conditions are changed. People ought to be satisfied to invest their money legitimately in an enterprise, and depend upon its profits. Unless our capitalists will do this, it will be extremely difficult for us to compete successfully with similar establishments East. Or perhaps some enterprising capitalists from the East will come here and go into manufacturing among us, as they are already coming and buying up our good mines, under the noses of our money-lending, interest-consuming capitalists. When they do, perhaps our monied men will come to their senses and start in to help the State in the way they should have done long ago.

MINING ACCIDENT.—While eight men were in the bottom of the Forman shaft, Gold Hill (Nev.), priming holes last Wednesday, one charge went off, and Charles Roberts, of Gold Hill, had both arms blown off and the top of his head. He leaves a wife and two children. John Date had one side of his head blown off. He leaves a wife in England. Chas. Josellini was standing on a plank a few feet above, and was badly wounded in the groin. He will recover. Several others were injured but not seriously.

The third dividend of the Evening Star mine at Leadville, Colorado, was paid at New York on the 24th ultimo. The amount was \$25,000.

Twenty-Four Page Holiday Extra of the "Mining and Scientific Press."

We propose, in Christmas week, to print an extra large edition of the MINING AND SCIENTIFIC PRESS. It will consist of 24 pages, and will be handsomely illustrated with new and appropriate engravings, which are now being prepared. This edition will be but an earnest of the endeavors we are making to have the PRESS of 1880 excel its predecessors in all important features.

Among the many articles of value for information and reference in our this TWENTY-FOUR page number, will be the following:

RAINFALL AND TEMPERATURE IN CALIFORNIA. With this article is a very elaborate and extensive table, showing the monthly and total rainfall and temperature from 1870 to 1880, at the following important cities and towns in California: San Francisco, Niles, Livermors, Stockton, Sacramento, Auburn, Cisco, Truckee, Marysville, Modesto, Red Bluff, Fairfield, Merced, Pataluma, Tulare, San Mateo, San Jose, Gilroy, Pajaro, Salinas, Soledad, Redding, Delano, Sumner, Los Angeles, Caliente, Mojave, Colton, Napa, Woodland, Williams, Oakland, Ione, Fresno, Anaheim, Santa Cruz and Martinez. Nothing as comprehensive as this on the subject has yet been published.

A large illustration with description of Dodge's New Shaking Table Concentrator, a machine now in operation here.

COPPER ORES.—Methods of sampling and assaying. How they are bought and sold. Classes of ore and price per unit.

LEAD FUMES.—Analyses of fumes of lead furnaces. Formation of fumes; results of condensation.

OUR GRAVEL MINES.—Condition of our hydraulic mining interests. Late improvements. Projected enterprises.

LEACHING OF ORES.—Results of leaching on this coast.

GOLD AND SILVER REFINING.—Showing the methods by which the various operations are performed at the New York assay offices.

OUR NORTHERN COAST TRADE.—With engraving of one of the class of steamers engaged therein.

INDUSTRIAL NOTES.—The latest news of interest in the industrial world.

PLUMAS COUNTY MINES.—A description of the mines of Plumas county and their present condition.

RICHMANN ROCK DRILL.—A description of a new drilling appliance now being introduced in our mines.

CHLORINATION WORKS.—Engraving and article describing the process and machinery for a new method of oblorinating gold ores.

YOSEMITE IN WINTER.—A handsome engraving, drawn and executed by first-class artists.

These are only a few of the articles being prepared for this extra 24-page edition of the PRESS.

The Rising Sun Mine.

The Rising Sun mine, near Colfax, is now making developments, that will, in a short time, prove profitable to its owners. The recent strike of the ledge in the eastern part of the mine, in the 100 level, completes a continuous ledge of good pay ore through the mine from the 1st to the 9th level. The history of the mine has demonstrated the fact that its richest part is toward the east. In the 300 east drift, which is 80 or 90 ft. further east than any other in the mine, we are informed that the ledge is quite large and exceedingly rich, and as progress is made further east, the ledge increases in size and the ore improves in quality. The formations in this drift is thought to indicate the existence of a large body of rich ore not far from the present workings, and work in this direction is being pushed forward with the greatest energy. The company have just paid a dividend in New York. The Rising Sun was located in the fall of 1863, and from 1867, the year in which the mill was erected, it has been a dividend-paying mine. During its existence it has yielded bullion to the value of nearly \$2,000,000. There are now about 1,200 cords of wood in the yard for the winter supply, all paid for. The mill is kept running constantly day and night, and everything indicates a continuance of the company's success.

Arctic Exploration.

The Cruise of the "Jeannette" Discussed by the Academy of Sciences.

At the meeting of the California Academy of Sciences a very interesting discussion took place concerning the *Jeannette* expedition to the Arctic. A very large audience was present, including Capt. Hooper, of the revenue cutter, *Corwin*, and his officers; Mr. W. H. Dall and Mr. Baker, of the U. S. Coast Survey, and several whaling captains, all of whom had been in the Arctic this summer. Among the audience were a number of persons interested in Alaska and others to whom the subject of Arctic exploration generally is of interest. The proceedings were opened by Mr. Chas. Wolcott Brooks, who read a very elaborate paper on the subject of Arctic exploration. He had gathered the main facts regarding the conditions in the Arctic this year from conversations with the whaling captains, and by examination of their logs.

Last Seen of the "Jeannette."

After coaling at St. Michaels, the *Jeannette* passed through Bebring's straits, made a stop at Cape Seroso on the northern coast of Siberia to leave letters, from which point he evidently steered direct for the southeasterly point of Herald island, near which he was seen, Sept. 2d, by Capt. Bernes, of the whaler, *Sea Breeze*. The next day the smoke from his smoke-stack was seen by several other whalers, who were to the northward of the *Sea Breeze*. He was still standing northward. This was the last that has been seen or heard of the *Jeannette*. Mr. Brooks then proceeded to present such information as he had been able to gather from the log books of whalers in regard to ice-flows, winds, etc., from which it appears that the time of Capt. De Long's arrival in the Arctic was peculiarly fortunate, as he undoubtedly found an open passage between ice barriers along the eastern point of Herald island, and thence along and near the east coast of Wrangell Land for 200 or 300 miles. The wharft at the whaling ground below Herald island was such as indicated a most favorable opportunity for the *Jeannette* to make her way north. The whaling fleet did not leave the vicinity of Herald island until about the middle of October—some six weeks after the *Jeannette* passed up and through the fleet, but not near enough to any ship to have communication. When the fleet left the

Two Missing Whalers, The *Vigilant* and *Mount Wollaston* which were considerably to the northward of the balance of the fleet, were unable to follow by reason of the rapidly forming ice to the southward of them, and when those two ships were last seen they were steering north into clear water. Within the next day or two an impassable barrier of ice must have been formed in the vicinity of Herald island, through which neither the *Jeannette* nor the missing whalers could have made their way either during the winter of 1879-80, or even during the past summer.

The life-history of Captain Ebeazer F. Nye, of the *Mount Wollaston*, is a startling romance of hair-breadth escapes from shipwrecks and positions of great danger, and he has been heard to say that he should not fear to winter in the Arctic with his vessel. Now, what is more natural than, when finding themselves thus cut off and closed in completely by ice in the straits south of them, and knowing for a certainty that they would be obliged to winter in the Arctic, a desire if possible to catch another whale or two and to get away the blubber to supply them with food necessary to withstand an Arctic winter? To satisfy their most pressing demand for winter food they would be obliged to keep in channels of open water, however far north such might extend at this season of the year. As the open area available to them trended northwesterly, continuing probably while the ten days of southerly winds which are known to have prevailed, their progress northward would be more easily effected.

Speculation Concerning Subsequent Movements of the "Jeannette."

The next consideration of the whalers would be, after obtaining food, to select a place to winter near some protecting shore, say Wrangell Land. Having seen the *Jeannette*, which they knew intended to winter far north, and observing her pass up that same northerly channel but five weeks before, it is quite natural that they should seek to reach a point, with a fair wind to favor them, at which they could hope to communicate with her most easily, either directly or by building a fire, whose rising smoke would attract her attention, knowing that a vessel so well fitted was the nearest and only source of assistance in case of pressing necessity. Captain Baudry is quite confident that, for some time after he left the whalers, the water continued open far north of where he last saw them, especially along the channel-way, where the current sets along the east coast of Wrangell Land and past Herald island. Whatever ice was formed above, was continually broken up and repacked into hummocky ice along the southern borders of the open water in the Arctic, and was built up upon this barrier until the open water to the north was filled with ice. The series of gales from the northwest which prevail in the Arctic late in

the season drift all loose ice southward from the vicinity of Herald island and the channels around Wrangell Land, and while thus packing this ice into impenetrable masses at the southern portion of the Arctic, he believes they must open a clear channel, which would enable Capt. De Long, with the *Jeannette* already in position and capable of steaming against a head wind, to penetrate to higher northern latitudes, if so inclined, and attain parallel quite inaccessible to any vessel which might enter the Arctic a year later. A repetition of the same class of weather and winds this year may again enable him, late in the season, even after the straits are closed, to follow northward along the eastern shore of Wrangell Land and to attain a still higher degree of latitude through open areas of water, on the borders of which wild geese, ducks and other sea-fowl go annually to rear their young.

Icebergs in the Arctic.

Captain E. E. Smith, who was ice pilot of the revenue cutter, *Thomas Corwin*, and who has made 13 trips to the Arctic, spending one winter among the Inuits, says that icebergs are not formed in the Arctic on the Pacific side. There is only what is termed hummocky ice, which may, however, be piled 100 ft. thick. He has seen such ice aground in 10 or 12 fathoms of water. Captains estimate the average thickness of ice where it freezes without displacement, at about 21 ft. Capt. Thomas Long, in 1867, remained for three days within 15 miles of Wrangell Land and made a drawing of the coast from Cape Thomas to Cape Hawaii. Several high peaks were seen. Although frequently seen, it is admitted that no person has yet succeeded in landing upon this generally

the winter. As the two whalers would naturally keep together, it is probable that the less staunch vessel was abandoned and its timber used for fuel.

The past winter having been an unusually severe one, the ice barrier extended further down than usual, and it is probable that the open passage in the main body of ice further north was late in opening, and that the *Jeannette* was unable to move clear of the ice bodies adjoined to the shore where she wintered, so as to make any headway this summer before the retreat of the whaling fleet. If the whalers are frozen in near her, the same result applies to them.

Although the *Jeannette* may not have been able to accomplish much during the past severe season, the experience gained by her trained crew place her in the best possible position for future work, and the second winter of an Arctic cruise is the one to which all experienced Polar voyagers look for the accomplishment of the most effective sledge-work and important explorations. Few experienced students of Arctic discoveries and previous expeditions will believe that in a single season she could have been reached by any vessel dispatched to accomplish in one short summer, a distance which the *Jeannette* required over one year, with two summer seasons to accomplish.

Newly Discovered Land.

In the course of the paper, Mr. Brooks stated that a new land had been discovered north of Point Barrow, and was for the first time laid down by him on the map exhibited. This new land was called Keenaa's land, from the fact that it was first seen by Capt. Keenaa, of the whaling bark *James Allen*, while "boiling down," about 100 miles north of Point Barrow.

Capt. Smith, the ice pilot, said that there was a reason why those on the *Jeannette* should not come out of this Arctic if the vessel was lost. He had wintered in the Arctic, and had been out when the mercury was 64° below zero. But he had experienced no inconvenience except as to the parts that might be exposed, as the nose, which sometimes became frost-bitten. Should it become necessary for the officers and crew to abandon the *Jeannette*, if they will travel as their Indian guides will direct, they will be saved. Capt. De Long doubtless had no idea of coming out of this Arctic this year, having determined to push north for the time for which he has fitted out.

Dr. Dall was called upon, but said he had no views to offer which could throw any further light upon the subject.

An Ambitious Aeronaut.

Just before the meeting adjourned Mr. Wells, a veteran aeronaut, made some inquiries of Capt. Williams as to the current of air in the Arctic. He stated that he had always desired to make an ascent in the north, and then offered his services to any expedition that should be sent out next year.

Alaska.

Our Territory of Alaska has of late attracted more attention than usual. It is an immense tract of country which is very little known. That its interior will be better known before long, there is little doubt. Gold has been found on the Yukon river, and also, lately, on the Takow river. In the spring there will be further prospecting done.

A story is now current that rich discoveries of silver were made last season in Alaska by the crew of a whaling vessel. The story, as told by the captain of the whaler, is as follows: While the vessel was lying in a small bay at the mouth of one of the rivers which empty into the ocean on the coast of Alaska, a great many of the natives came aboard to trade for sea-biscuits. They were treated so liberally by the white men that the chief invited the captain to accompany them up the river on a fishing excursion. A whale-boat was manned, and the captain, one of the mates and four men started on the expedition. The entire party went up the river about 15 miles, passing over a rapid which was difficult on account of the swift current and rocky obstructions. Soon after passing the rapids they came in sight of a hill, fringed with trees and shrubs at its base, but barren and rocky toward the summit, which seemed to be not more than 400 or 500 ft. high. Going up the hill, what was supposed to be a crater of an extinct volcano was found. The captain saw a metallic substance and broke it off with a boat ax. Where the ax had cleaved its way through the rock, he saw it was as soft nearly as lead, although it did not shine. He thought then that it was a metal of some kind, and kept it. The mate meantime had picked up some of the loose rocks and boulders, and they started away. Toward evening a native

brought a piece of rock about 12 inches long by 6 inches thick which weighed 48 lbs., and sparkled with gold, stating that he had found it near another hill farther up the river, and that such rock was easily gathered there. The party returned to the vessel, and in due time arrived in San Francisco. Here the story was told to a gentleman living in Oakland, and the specimens handed over to him for the purpose of having proper assays made. This was done, and the piece which the captain chopped off the top of the hill with the ax, went \$6,000 per ton in silver, and the loose rocks picked up on the side of the hill went as high as \$275, silver, per ton.

On the strength of this story, for which we do not vouch, it is said that an Oakland company has been formed to send the whaler up next April for a cargo of the ore.

There is good coal up there we know, whether there is silver or not. The *Corwin*, in her Arctic trip, this year found a splendid bed of coal in northern Alaska. It is near the beach, and easily quarried out. Capt. Hooper informed the writer that the coal was of good quality.

Alaska has very many good harbors, and our Government is having the coast-line properly surveyed. Mr. Dall has been there with a surveying party, on the Yukon, this year.

Among the harbors and towns on the Alaskan coast, is that of Fort Wrangel, so named after the famous Russian Arctic explorer. We give an engraving of this place herewith. Fort Wrangel is this side of Sitka, on the steamer's course. The place is a small one, and is noted for two features—the presence of numerous Indians, whose peculiarities at once strike the new comer, and for its being the point of the first introduction of our missionary work. It is a great free-trading station, though now not as important as formerly.

Our engraving is taken by permission from Conkling's forthcoming work entitled "Picturesque Northwest."

THE Scadden Flat G. M. Co. has sustained a loss of between \$18,000 and \$20,000, owing to the burning of their hoisting works, and they now offer \$1,000 reward for the arrest and conviction of the incendiary.

FORT WRANGELL WITH ITS MISSION CHURCH AND SCHOOL.

unapproachable terra incognita.

No News From the Natives.

Dr. W. H. Dall, acting as assistant in charge of the U. S. Coast and Geodetic Survey in Alaska, just returned from a cruise in the *Yukon*, and states that in his intercourse with the natives he had received no news of the *Jeannette*. None of the whalers in the Arctic this year have received any tidings of this vessel. The *Thomas Corwin* made five trips across the Arctic basin, besides visiting every available point along the coasts of Alaska and Siberia. In visiting Point Barrow he found the ice packed to within four miles of the shore. When at Cape Lisburne the crew mined and took on board 25 tons of excellent coal from surface croppings. It burned well, making steam readily and giving off little more smoke than anthracite. Captain E. E. Smith informed Captain De Long of this abundant supply of coal.

Safety of the "Jeannette."

With the facts as far as known before us, we may reasonably argue that had any abandonment of the *Jeannette* taken place, with her 76 trained dogs, her seven dog-eared and two experienced Inuit hunters, all admirably trained and equipped for ice travel, and the large stock of carefully prepared pemican which she carried, the sled parties would have made for the southern edge of the ice-pack near Herald island and as the most natural of all spots frequented by American whalers, to whom alone they could confidently look for relief. Having abundant proof that no such parties appeared, we may feel assured that the *Jeannette* is safe and sound, and that her polar voyage of scientific exploration is proceeding favorably according to the plan of its enterprising and generous patron. It is fair to presume that she passed northward along the unknown coast of Wrangell Land beyond immediate communication, just as all on board fully hoped and intended.

From the last reliable reports of the "Jeannette" and her position,

It is not unreasonable to suppose the *Jeannette* passed a cold but quiet winter, frozen in the ice north of Wrangell Land, in about 78°, fully 300 miles beyond any communication. The missing whalers, *Vigilant* and *Mount Wollaston* may have kept the *Jeannette* company during

Far over the ice to the north Capt. Keenan saw a range of high hills. This high land could be distinctly seen. The presence of this land, and the fact that the ice persists on the northern borders of the Kuro Siwo, argues, it is thought either an archipelago or a very large body of land to the north.

Capt. Hooper's Remarks.

Capt. Hooper, of the *Thomas Corwin*, was invited to give his views on the subject. Capt. Hooper said that the subject had been so ably handled that there was nothing left to say. He thought, however, that the *Jeannette* might be embayed in the ice, and her crew in need of help. The ice in that region is treacherous, and a vessel which becomes embayed is as helpless as though she were on dry land. In such case the vessel must be abandoned. If the officers and crew of the *Jeannette* have left her they have doubtless made their way over the ice in the direction of Siberia. The proper thing to be done now is to send to the north a ship fitted up for a year's stay, and supplied with every necessity to enable it to remain a winter in the ice. Such a vessel might endeavor to make the northwest passage around Siberia, but further north than the route pursued by Nordenskiöld. It is known that far to the north of Siberia there is open water, and it may be that this is the true way to reach the pole. The subject is worthy of consideration, and should not be allowed to drop. With regard to the *Jeannette*, Capt. Hooper could offer nothing as to her position. But one thing must borne in mind, and that is that she and her brave crew are amid the ice of the Arctic, and may be in need of assistance.

Captain Williams said that he had seen the smoke of the *Jeannette* September 7, 1879, and not as stated before. At that time the smoke bore almost due south from Herald island. He remained in the same place for two days after he saw the smoke, and as the hull of the *Jeannette* did not rise above the horizon, it was likely that she was going north. Capt. Nye, of the *Mount Wollaston*, who came on board Capt. Williams' vessel, said that he also had seen the smoke to the north. It is likely that, after Capt. Williams left him, Capt. Nye went to the north of Herald island.

Arctic Exploration.

Cruties of the "Jeannette" Discussed by the Academy of Sciences.

At the meeting of the California Academy of Sciences a very interesting discussion took place regarding the *Jeannette* expedition to the Arctic. A very large audience was present, including Capt. Hooper, of the revenue cutter, *Corwin*, and his officers; Mr. W. H. Dall and Mr. C. De Long, of the U. S. Coast Survey, and several other captains, all of whom had been in the *Jeannette* this summer. Among the audience were a number of persons interested in Alaska and to whom the subject of Arctic exploration generally is of interest. The proceedings were opened by Mr. Chas. Wolcott Brooks, who presented a very elaborate paper on the subject of Arctic exploration. He had gathered the main facts regarding the conditions in the Arctic from conversations with the whaling captains, and by examination of their logs.

Last Seen of the "Jeannette."
After coaling at St. Michaels, the *Jeannette* sailed through Behring's straits, made a stop at Sarsos on the northern coast of Siberia to get letters, from which point he evidently sailed direct for the southeasterly point of Herald island, near which he was seen, Sept. 1, by Capt. Barnes, of the whaler, *Sea Breeze*. The next day the smoke from his smoke-stack was seen by several other whalers, who were to the northward of the *Sea Breeze*. He was still sailing northward. This was the last that has been seen or heard of the *Jeannette*. Mr. Brooks proceeded to present such information as he had been able to gather from the whaling fleet in regard to ice, winds, etc., from which it appears that the Arctic was peculiarly fortunate, as undoubtedly found an open passage between ice barriers along the eastern coast of Herald island, and thence along the coast of Wrangell island for 200 or 300 miles. The whaling ground below Herald island was such as indicated a most favorable opportunity for the *Jeannette* to take her way north. The whaling fleet did not leave the vicinity of Herald island until about the middle of October, some six weeks after the *Jeannette* sailed up and through the fleet, but not far enough to any ship to have communication. When the fleet left the

Two Missing Whalers.

The *Vigilant* and *Mount Wollaston* which were considerably to the northward of the balance of the fleet, were unable to follow by reason of the rapidly forming ice to the southward of them, and when those two ships were last seen they were steering north into clear water. Within the next day or two an impassable barrier of ice must have been formed in the vicinity of Herald island, through which neither the *Jeannette* nor the missing whalers could have made their way either during the winter of 1879-80, or even during the past summer.

The Life-Story of Captain Ebenezer F.

Nye, of the *Mount Wollaston*, is a startling romance of his life-escape from shipwrecks and positions of great danger, and he has been heard to say that he should not fear to winter in the Arctic with his vessel. Now, what is more natural than, when finding themselves thus cut off and closed in completely by ice in the straits north of them, and knowing for a certainty that they would be obliged to winter in the Arctic, a desire if possible to catch another whaler or two and at once away to the north to supply them with food necessary to withstand an Arctic winter? To satisfy their most pressing demand for winter food they would be obliged to keep in channels of open water, however far north such might extend at this season of the year. As the open area available to them transpired northwesterly, continuing probably while the ten days of southerly winds which are known to have prevailed, their progress northward would be more easily effected.

Speculation Concerning Subsequent Movements of the "Jeannette."

The next consideration of the whalers would be after obtaining food, to select a place to winter near some protecting shores, say Wrangell Land. Having seen the *Jeannette*, which they knew intended to winter far north, and knowing her pass up that same northerly coast about five weeks before, it is quite natural that they should seek to reach a point, as far north as they could, at which they could either directly or by building a fire, whose smoke would attract her attention, knowing that a vessel as well fitted was the nearest source of assistance in case of pressing need. Captain Bauldry is quite confident that some time after he left the whalers, the water continued open far north of where he saw them, especially along the channel between the current acts along the east coast of Wrangell Land and past Herald island. When ice was formed above, was contained up and repacked into hummocky ice along the southern borders of the open water.

the season drift all loose ice southward from the vicinity of Herald island and the channels around Wrangell Land, and while thus packing this ice into impenetrable masses at the southern portion of the Arctic, he believes they must open a clear channel, which would enable Capt. De Long, with the *Jeannette* already in position and cable of steaming against a head wind, to penetrate to higher northern latitudes, if so inclined, and attain parallel quite inaccessible to any vessel which might enter the Arctic a year later. A repetition of the same class of weather and winds this year may again enable him, late in the season, even after the straits are closed, to follow northward along the eastern shore of Wrangell Land and to attain a still higher degree of latitude through open areas of water, on the borders of which wild geese, ducks and other sea-fowl go annually to rear their young.

Icebergs in the Arctic.

Captain E. J. Smith, who was ice pilot of the revenue cutter, *Thomas Corwin*, and who has made 13 trips to the Arctic, spending one winter among the Innuits, says that icebergs are not formed in the Arctic on the Pacific side. There is only what is termed hummocky ice, which may, however, be piled 100 ft. thick. He has seen such ice aground in 10 or 12 fathoms of water. Captains estimate the average thickness of ice here it freezes without displacement, at about 21 ft. Capt. Thomas Long, in 1867, remained for three days within 15 miles of Wrangell Land and made a drawing of the coast from Cape Thomas to Cape Hawaii. Several high peaks were seen. Although frequently seen, it is admitted that no person has yet succeeded in landing upon this generally

the winter. As the two whalers would naturally keep together, it is probable that the less staunch vessel was abandoned and its timber used for fuel.

The past winter having been an unusually severe one, the ice barrier extended further down than usual, and it is probable that the open passage in the main body of ice further north was late in opening, and that the *Jeannette* was unable to move clear of the ice bodies affixed to the shore where she wintered, so as to make any headway this summer before the retreat of the whaling fleet. If the whalers are frozen in near her, the same result applies to them.

Although the *Jeannette* may not have been able to accomplish much during the past severe season, the experience gained by her trained crew place her in the best possible position for future work, and the second winter of an Arctic cruise is the one to which all experienced Polar voyagers look for the accomplishment of the most effective sledge-work and important explorations. Few experienced students of Arctic discoveries and previous expeditions will believe that in a single season she could have been reached by any vessel dispatched to accomplish in one short summer, a distance which the *Jeannette* required over one year, with two summer seasons to accomplish.

Newly Discovered Land.

In the course of the paper, Mr. Brooks stated that a new land had been discovered north of Point Barrow, and was for the first time laid down by him on the map exhibited. This new land was called Keenan's land, from the fact that it was first seen by Capt. Keenan, of the whaling bark *James Allen*, while "boiling down," about 100 miles north of Point Barrow.

Capt. Smith, the ice pilot, said that there was no reason why those on the *Jeannette* should not come out of the Arctic if the vessel was lost. He had wintered in the Arctic, and had been out when the mercury was 64° below zero. But he had experienced no inconvenience except as to the parts that might be exposed, as the nose, which sometimes became frost-bitten. With regard to the *Jeannette*, Hooper could offer nothing as to her position. But one thing must borne in mind, and that is that her brave crew are amid the ice and may be in need of assistance.

He said that he had seen the *Jeannette* on September 7, 1879, and that at that time the smoke from her funnel was seen from Herald island. He said that he had seen the *Jeannette* on September 7, 1879, and that at that time the smoke from her funnel was seen from Herald island. He said that he had seen the *Jeannette* on September 7, 1879, and that at that time the smoke from her funnel was seen from Herald island.

Chiricahua, Arizona.

A correspondent of the *Arizona Citizen* writes as follows: I have got something to tell you about a new thing that is yet to decorate and adorn the map of this great and growing country. I have in this a direct reference to the new town of Chiricahua City. The name is hard to spell, but easy to pronounce (cherry cow); but I expect some of the hoodlums will get it "red cow" the first time. It is located on a beautiful mesa or plateau of land, with at least 200 acres without a break, and slightly undulating toward San Simon valley. The rush for lots became a stampede. Tents went up every 15 minutes, fence poles, wickiups, hockells and all kinds of cheap improvements were in order. There are from 20 to 40 people coming into the camp every day, most of them from the eastward; and we hear of very many from Leadville, Silver City, Tombstone, Harshaw, and Tucson, who are on the way with stores, saloons, restaurants, corrals, etc. In fact, the racket is a big one, and everybody is tumbling to it.

Now about the country—where is it and what about it? Well, the country in general is the Chiricahua mountains, from Camp Bowie to the Mexican line, but on the east side of the mountains only. The new town and camp is 25 miles southwest from San Simon station, on the railroad. By wagon road it is 25 miles southwest of Camp Bowie.

Ten miles from Bowie to the southeast is Wood canyon, where good mines of gold, silver and lead were first discovered a little over two months ago. Then, from Wood canyon around the head of the foot-hills via San Simon valley, a distance of 15 miles, is Chiricahua City, the head center of all this great racket. It is in the center of a mineral belt about 20 miles in length, and about 5 or 6 in width, on the foot-hills of the eastern slope of the mountains. There is plenty of wood, and water, and grass in all directions.

There are three running streams of water coming out of the mountains, the principal one of these being the Turkey Creek East, on which the new town is located. It runs through the western side of the town. I cannot go into an account of the undeveloped mines for there are too many of them. In these two districts, the California and Chiricahua mining districts, there are already about 1,000 locations, and more being made every day.

The Texas and Dun mines have been hought by some Oil City men, who have organized the Texas Con. mining company, and have ordered a smelting furnace, and are hurrying forward lumber and material of all kinds, for offices, boarding houses, and everything else needed. Within 60 days from this date they intend to be shipping 10 tons of bullion per day.

Wood for coal is abundant in every direction for miles, and some timber abounds over a country 12 miles long by 5 miles wide. The large bodies of ore are generally carbonates of lead with iron oxides, and sometimes copper; in fact, there are some good copper mines in the district.

Drift Mining about Lowell Hill.

Mining in the gravel deposits in the vicinity of Lowell Hill, on the divide between Steep hollow and Bear river, is being carried on actively, by means of tunneling and drifting. The tunnel of the "Golden Bull," now known as the "Morgan" above the town of Lowell Hill is in between 1,500 and 1,600 ft., from which good pay gravel is being taken out. The claim is under the superintendence of Capt. Mikel, an experienced gravel miner from Howland Flat, Sierra county, and is fitted up in the best kind of shape for working—the tunnel being well constructed and the sluices and all the improvements about the claim showing skillful direction and management.

The Swamp Angel tunnel having run out of grade the company is reaching their ground with a bed rock drift from the East New York tunnel, and have about 400 ft. yet to run to strike the gravel lead, when washing will be resumed. The Swamp Angel has a large extent of valuable ground.

The "Steep Hollow" (the Dewey claim) tunnel is in a distance of 1,700 ft., and has yet 280 ft. to go to reach gravel. The tunnel is being driven with a Burleigh drill, at the rate of four ft. a day. The tunnel is low enough to be at the bottom of the channel, and in this respect has the advantage over most of the tunnels in that section, as they have generally been found too high.

Operations in the Planet claim have been suspended, as on account of the tunnel being too high it was found difficult and expensive to contend with the water and open the ground. The company have concluded to wait until the tunnel in the Dewey claim (being adjoining ground) has bottomed the lead, and shown the precise level at which the proposed new tunnel of the Planet will have to be located. This will be determined during the present winter, and next spring the Planet company will commence driving a new tunnel. In the meanwhile the only work that will be done in the claim will be in replacing some of the old timbers in the present tunnel with new.

All the above named companies are on the gravel channel, which is extensive, and has been sufficiently worked to demonstrate its value. These are all drift claims, and can only be exhausted after many years of labor.—*Grass Valley Union.*

WANTED!
SITUATION as ASSAYER

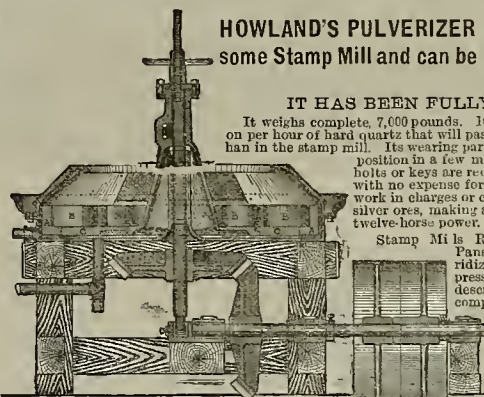

By a young man who thoroughly understands assaying all kinds of ores. A graduate of Kustel & Riote, to whom he refers. Address his father,

F. HOFLING, Jewelry Store, No. 5 Third St., S. F.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,250 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

GOLD SAVING
SILVER PLATED
Amalgamating Plates,

FOR QUARTZ MILLS AND GRAVEL CLAIMS.

ALSO, CHALLENGE SWINGING PLATES,

For use in Sluices for Saving **FLOAT GOLD**. Constantly on hand **PLATES** of all sizes; are prepared to fill orders on short notice. Old Copper Plates Purchased. Replated or Gold extracted by our process, whereby we save the Copper and remove the Gold at a very small expense.

A Card from Architects.

The California Architect and
Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from prominent Architects in this city:

Behaving that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the **CALIFORNIA ARCHITECT AND BUILDING REVIEW** will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, F. Huernie, John Marquis, B. McDougall & Son, Wm. Moser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henriekson

INGERSOLL
Rock Drill and Air
Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

GEO. R. FOARD, GEN'L AGENT,
No. 18, First St., S. F.

INCERSOLL
ECLIPSE ROCK DRILLS.

The Most Economical Air Compressor in the Market.

MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,
49 Fremont St., S. F.

SAVE YOUR
GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.

Machinery can be seen in operation every day at

No. 143 Fremont Street.

M. B. DODGE.

**Scientific and Practical Books
on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1887.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple or der. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 155 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

DODGE'S

UNEQUALLED

Concentrating Machinery

FOR CONCENTRATING GOLD, SILVER,
LEAD AND COPPER ORES.

Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching.

Plans, Drawings and Estimates for Working Ores by any Process.

M. B. DODGE,
143 Fremont Street S. F.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Offices, No. 320 Sansome street, Room 10.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SELEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

Well Tested Mining Devices.

GRATE BARS-Hydraulic. A saving of about half the usual expense. GROOVED RIFFLES-Hydraulic or quartz. Will largely increase the yield of gold. Concentrators No. 1 and 2. Former without machinery. Latter for fine Gold, Sulphurets or Black Sand. BRYAN TYSON, Patentee. Manufactured by Rankin & Co., Pacific Iron Works.

The Explorers' and Assayers' Companion,
By J. S. PHILLIPS, M. E.

(Third edition.) Price of Vol. 1, \$3.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING NOVEMBER 23D, 1880.

234,648.—OPENING CANS.—J. N. Arment, Dayton, W. T.
234,733.—SNAP HOOK.—G. E. Bales, Walla Walla, W. T.
234,701.—HARNESSES.—T. C. Churchman, Sacramento, Cal.
234,710.—FAULTER.—P. Heitzelman, S. F.
234,798.—FURNACE.—J. J. Napier and J. M. Thompson, S. F.
234,725.—PACKING BOX.—L. Racouillat, S. F.
234,862.—COMPOUND.—M. A. Reeves, Merced, Cal.
234,793.—AIR COMPRESSOR.—J. M. Stockmen, Los Angeles, Cal.
234,826.—DRY WASHER.—J. Waugaman, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

COMPOUND FOR CATARRH.—Mrs. Mary A. Reeves, Snelling, Merced Co., Cal. Patented Nov. 23, 1880. No. 234,808. This compound is employed for the treatment of diseases of the mucous membrane and skin, it being especially efficient for catarrh, scald-head, and diseases of the scalp, which cause a falling off of the hair.

DRY ORE WASHER.—John Waugaman, Los Angeles, Cal. Patented Nov. 23, 1880. No. 234,826. The object of this invention is to separate from earth or gravel the gold contained therein, without the use of water; and the improvements consist in certain combinations of screens and aprons, with peculiarly operated double bellows, furnishing an alternate air blast, by means of which the gold is separated from the earth or gravel. We have already illustrated this invention and described it in detail.

WHEEL-HUB.—G. J. Overshiner, San Jose, Cal. Patented Nov. 30, 1880. No. 235,007. This device consists in a peculiar formation of an inner hub of wood, with exterior enclosing shells and flanges, and in a means for securing the spokes in sections, which are held in the hub by bolts, so that said sections may be moved outwardly to set the tires when they become loose. By this construction a strong, serviceable wheel is made, with a means for keeping the tire tight without continual resetting.

ELEVATOR.—A. W. Castles and C. U. Akin, Eureka, Nev. Patented Nov. 30, 1880. No. 234,956. This invention relates to certain improvements in safety apparatus for hoisting devices such as are used in mines; and it consists in a means by which the weight of the descending cage is utilized as a source of power for operating some desired machine, and through the means of the governor of such machine, regulating the speed of its own descent; in a peculiarly operating wheel and lifting bolt for the cable by which the cage may be stopped by the men in the cage, without reference to the engineer on the surface; in a peculiarly operated and constructed detaching apparatus for preventing overwinding, and in providing a supplemental reel and rope for engaging with the released cable when overwinding occurs, the rotation of this reel by the cable causing levers to operate which automatically shut off steam from the hoisting engine, and throw on the brake. We shall give a more complete description of this apparatus in a future number.

OREGON MINING STATISTICS. The Oregon Sentinel says: The following statistics in regard to mining in Jackson county are taken from the records in the County Clerk's Office, as compiled by W. J. Plymale, Deputy Clerk: Number of mine locations in the several mining districts of Jackson county from Oct. 29, 1856, to June 30, 1880—Big Applegate, 466; Little Applegate, 39; Uniontown, 2; Sterling, 151; Jackson, 491; Jacksonville, 1,463; Forty-nine, 234; Willow Springs, 785; Gold Hill, 361; Galls Creek, 95; Footh Creek, 258; Evans Creek, 115; Sardine Creek, 132; Louse Creek, 25; Dry Diggings, 33; Jump-off Joe, 114; Grave Creek, 224; Cayote Creek, 75; Poorman's Creek, 300; Steamboat 45. Of these 16 were copper locations, 124 were cinnabar, 1 tin, and the balance gold and silver. During the same time there were 1,221 conveyances of mining claims recorded and 133 transfers of water ditches. All of the above was compiled for the use of the census department.

THE AMERICAN EXCHANGE hotel, so well known to all the traveling public, has been refitted, overhauled and put in first rate condition, and is now under the management of Charles Montgomery, proprietor of the three "Montgomery Hotels" on Second street, in this city. He is an old hotel man, having had many years experience. He will run the American Exchange on improved principles. The building has been thoroughly renovated.

News in Brief.

VEFUVIUS is in active eruption. The yellow fever is raging in Guayaquil. The revolution in Ecuador has been quelled. The crown jewels of France are to be sold.

THE St. Lawrence is frozen over at Montreal.

A CYCLONE in Missouri has done considerable damage.

ALL arriving steamers report unparalleled gales on the Atlantic.

HAGGIN & CARR have 45 teams canal-building in Kern county.

CRAWFORD'S Opera House, Topeka, Kansas, is burned. Loss, \$30,000.

THE New York coffee firm of B. C. Arnold & Sons has failed for \$1,000,000.

DURING November the Mints coined \$5,574,000 gold and 2,300,000 silver dollars.

FRANCOIS ANDERWERT has been elected President of the Swiss Confederation.

A BILL has been introduced in Congress, making the President's salary \$25,000.

A FUND of \$100,000 has been raised at Philadelphia as a present to General Grant.

THE President recommends that Grant be made Captain-General of the U. S. Army.

THE remnant of Victoria's band have murdered 30 persons near Chihuahua, Mexico.

It is reported that McDowell's name heads the list of retired officers sent to the Senate.

SERIOUS dissensions have again broken out in the British Cabinet over the Irish question.

SEVEN persons were killed in Chicago Tuesday morning by a switch engine running into a street car.

THE Arlington Hotel at Winnemucca was burned to the ground on Saturday; loss, \$10,000; insured for \$6,000.

THE House is inclined to be liberal in appropriations, and devote more to the internal improvements this year.

ONE of the provisions of the new Chinese treaty is that Americans shall not import opium, carry the product coastwise or sell it.

GENERAL HAZEN has been appointed Chief Signal Officer, and General McCook is promoted to the Colonels of the Sixth Infantry.

A CONTRACT is already closed for building 200 miles of the Mexico, Kansas, and Texas railroad, and work will begin at Fort Worth forthwith.

It is reported that Gen. Schofield will be relieved of the command of the Military Academy, and that he or Miles will be sent to San Francisco.

A GRAND international cotton exposition is contemplated in one of the Southern cities, for the exposition of cotton appliances and machinery.

A NUMBER of indictments for manslaughter have been found in connection with the burning of the steamboat *Seawanhaka* near New York some months ago.

THE Kearsarge mills, at Portsmouth, N. H., were burned recently. Loss, \$500,000. An operator was burned alive and 350 hands thrown out of employment.

TELEGRAMS from Waterford to the Dublin newspapers say that arms are being sold to an extraordinary extent, and that the whole country is armed to the teeth.

CLEAR LAKE swarms at this season with geese, swan and all species of ducks—mallard, canvas-back, spoon-bill, widgeon and teal—as well as curlew and sand-hill cranes.

AN investigation shows that 400,000 acres of land in Oregon, claimed by the Willamette valley and Cascade mountain military wagon-road company, has not been earned.

THE heaviest foreign mail which ever left New York Postoffice was dispatched last Wednesday by the outgoing steamers. It contained 106,578 letters and 192 bags of papers.

EVIDENCE increases of the rapid spread of the Land League terrorism, and honest tenants are becoming restive under it. Owners and agents say the condition is worse than months ago.

PARNELL's plan is to leave Dublin for London the moment that his trial is called, and by means of a resolution, to bring the Irish question before the Commons at the meeting of Parliament.

EXCHANGES at New York the past week excelled in magnitude those of any like period in the history of the Clearing-house, being over a billion dollars. In Chicago the gain from last year was over 51%.

SAYS the Sutter Banner: We understand that the leveeing throughout our levee districts is now completed and ready for the annual test, consequently there are many laborers thrown out of employment.

A MAN who is engaged in boring an artesian well nine miles southwest of Bakersfield struck water at the depth of 390 ft., but he continued until he reached a depth 592 ft. In this distance he met with 14 artesian channels.

In conversation with an intimate friend the President is reported to have expressed disfavor with the proposed scheme to raise a fund by popular subscription, to pension the ex-Presidents. He does not believe in it.

A MOST ghastly tragedy was enacted Tuesday near Chester, Ill. Louie Lockstein, a victim of religious excitement, escaped from his keepers and murdered three persons. In attempting to continue his work of blood, he was overpowered and captured.

Miners' Wages.

The statement is made that mine owners are planning to reduce the price of wages on the Comstock to \$3.50 per day for underground work. It is also said that the Miners' Union will resist the change, and a lock-out will be the result. The statements are made by the Carson Appeal, on the authority of Comstock miners. There have been rumors of this kind in the air for some time. We hope, however, they will prove to be without foundation.

It is admitted, of course, that the Comstock is not as prosperous as it once was, and that it is more difficult to collect assessments and keep the mines running. It is thought pretty hard by some stockholders to have to pay what they call high wages, during times when the mines are not paying dividends. It did not occur to these same stockholders to raise wages any higher when the mines were paying dividends, though this work is just as hard one time as another.

There is no doubt that economy will have to be more rigidly practiced in working Comstock, as other mines, in the future. But this is beginning to economize at the wrong end. It seems to us that economy ought to be inaugurated at the offices instead of the mines. If employees have to be reduced in number, in a mining company, it seems as if the non-producers should first be dropped. Without the working miner the mine becomes a mere stock-jobbing operation, unworthy of notice. If wages are to be cut down, the people placed in position by the nepotism of directors or officers, the president and the hangers-on should first be looked to. The miners are the last who should be disturbed.

In some of the big companies there are many employees who could very well be dispensed with. There are many leaks which can be stopped, and many small economies practiced, which would do much to lessen expenses. In a general reduction the miners will, of course, have to stand their share. But it is time enough to begin on them when all the other sources of expense have been looked after.

The miners underground, on the Comstock, earn their money, and earn it hard. Working in a hot, close mine is no child's play. They carry their lives in their hands from the time they step on the cage till they are back on the surface again. Nobody who ever went down into one of these mines, will think \$4 per day too much pay for the men working there.

Some persons argue that wages should be no more there than elsewhere. But it should be recollected that there are no mines in this country as deep and hot as those on the Comstock. The wages are not high for the work done. Those on the surface receive higher wages in proportion to the work done, dangers undergone, and wear and tear on the system.

Let the companies begin at the highest, instead of the lowest, in cutting down expenses. Let them cut down salaries of Presidents, first. They are useless officers, anyhow, and might be entirely dispensed with, for that matter. Mines can be run without Presidents or any officer at all, but they cannot be run without miners.

[COAL]

Vaccination for Scab in Sheep.

EDITORS PRESS:—I desire to announce to your readers that I have discovered a method of protecting sheep from the scab disease by vaccination. The principle is identical with that involved in vaccination to prevent smallpox in the human species. I do not claim that my method of vaccinating sheep will prove an absolute prevention of skin disease, but it will either prevent or reduce the disease to a milder form, as vaccination in human kind reduces smallpox to varioloid. In the case of sheep there may, in some cases, be a slight surface irritation of the skin which can be easily removed, but there will be no attack of the scab in its well-known virulent and penetrating forms. Anyone desirous of inquiring into this new method of meeting the scab disease may address me at the Baldwin Hotel, San Francisco.

S. H. KENNEDY.

San Francisco, Dec. 8th.
P. S.—Address, after January 15, 1881, Omaha, Nebraska.

By Universal Accord,

AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable, no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove walled with aquaria constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

The Californian.

THE RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. AGENTS WANTED in every town and village of the United States to canvass for this popular magazine. The most liberal commissions will be paid to responsible parties. This is a chance to make money at your own home. Address

THE CALIFORNIA PUBLISHING CO.

(P. O. Box 2319)

Copies of "Overland Monthly" Wanted.

We will pay 50 cents each for a few copies of the following numbers of the *Overland Monthly*: For the months of October, November and December, 1870; February and May, 1871; April, 1872; April and June, 1873; January, February, March, April, May and June, 1875.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

EXTRA DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

SAN FRANCISCO, DECEMBER 2, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, an Extra Dividend No. Twenty (23) of Seventy-five (75) Cents per share, was declared payable on Monday, December Thirteenth (13), 1880, at the office in this city, or at the agency of The Nevada Bank of San Francisco in New York.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

Office of the Western Mining Company (Contention Mine), San Francisco, December eighth (8), 1880.—At a meeting of the Board of Directors of the above named Company, held this day, a dividend No. six (6) of seventy-five cents (75c) per share was declared, payable the tenth (10th) instant. D. C. BATES, Sec'y.

Office—Room 79 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE
Silver King Mining Company.
SAN FRANCISCO, DECEMBER 7, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 12) of Twenty-five (25) Cents per share was declared, payable on Wednesday, December Fifteenth (15), 1880, at the office of the Company, Room 19, No. 328 Montgomery Street, San Francisco, Cal. Transfer books will be closed Friday, December Tenth (10), 1880.

JOSEPH NASH, Secretary.

REGULAR DIVIDEND NOTICE.

OFFICE OF THE
Standard Consolidated Mining Company.
SAN FRANCISCO, DECEMBER 2, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, Dividend No. Twenty-two (22) of Seventy-five (75) Cents per share, was declared payable on Monday, December Thirteenth (13), 1880, at the office in this city, or at the agency of the Nevada Bank of San Francisco in New York.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

ANNUAL MEETING.

THE ANNUAL MEETING OF THE
Stockholders of the Gould and Curry Silver Mining Company

Will be held at the office of the Company, Room No. 60, Nevada Block, No. 309 Montgomery Street, San Francisco, California, on Monday, the twentieth (20th) day of December, 1880, at one o'clock P. M. Transfer books will be closed on Thursday, December sixteenth (16th), 1880, at three o'clock P. M.

ALFRED K. DURBROW, Sec'y.

Alpha Hydraulic Gravel Mining Company.—Principal place of business, San Francisco, California. Location of works, Alpha Hill, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Nineteenth (19) day of November, 1880, an assessment, (No. 2) of Twenty (20) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. gold and silver coin, to the Secretary, at the office of said company.

Any stock upon which this assessment shall remain unpaid on the Twenty-fourth (24) day of December, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JAMES IRELAND, Sec'y.
Office, No. 216 Sansome Street, San Francisco.

SECURE PATENTS

Through Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

FRUE'S ORE CONCENTRATOR OR VANNER.
Plunger Jigs. Revolving Screens.
CRUSHING ROLLERS. SAMPLE GRINDERS.

FRASER & CHALMERS

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

Office, No. 230 California Street - - San Francisco, Cal.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all, and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable and simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often once used in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL

PACIFIC MACHINERY DEPOT.

"THE \$1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 750 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.
Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others:

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Utah Co., Utah, the "Eclipse" Feeder, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, was replaced by the "Challenge" Feeder, which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harsbaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. H. W. GREENWELL, of the Tingman Mine, El Dorado Co., or any other person can make \$1,000 by disproving the acknowledged superiority of my "CHALLENGE" Feeder, in a competitive trial, side by side, with any other Feeder, on wet or sticky ores from any mine, and I will give \$100 to any one who will procure the acceptance of this challenge, and arrange for a fair and impartial test on merit.

I mean business, Gentlemen, "either put up or shut up."

JOSHUA HENDY,

Manufacturer of all descriptions of Quartz and Saw Mill Machinery. A Large Stock of both New and Second Hand at Machine Works. Nos. 49 and 51 Fremont Street, San Francisco.

Agent for "BAKERS" Rotary Pressure Blowers.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which we are prepared to sell at LOWEST RATES.

No. 1.—Equaling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2.—Will do this work thoroughly in all but the hardest kinds of rock.

No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Caps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Explosives. For Sale at the Lowest Rates.

An Improved Portable Hoisting Engine.

The engraving given herewith is a representation of an improved portable hoisting engine, made by Merschutz & Cantrell, of the National Iron Works in this city. It is built especially for the requirements of this coast. The manufacturers have had some 20 years' experience in this class of work, having made a specialty of it. The changes made from time to time have been suggested by experience, and the result is that the improved hoist now made, and which we illustrate, combines all the improvements that practice has shown to be required.

All the parts are on a heavy cast frame. The reel is made from wire rope, with extra large gear wheels. The whole hoist is very strongly made to meet the requirements of the trade. The reversing of the engine is accomplished by link motion. The National Works make several sizes of this hoist. The largest size of this style is 8x12, and is adapted to hoist 1,000 ft. It weighs about 8,000 lbs. The smallest size will hoist 500 ft. It weighs about 5,000 lbs., and is 6x12 in size. The same style engines is also made with double cylinders, as some prefer them. They are all made strong, plain and neat.

A great advantage is that no skilled labor is required to set the engine up. They are all ready to be put to work as soon as they arrive on the ground. It forms a very cheap and good "rig" for opening a mine. In fact no simpler or cheaper one has been devised. Several of them have just been shipped from the foundry; one to the Carnero mine, Jucostitia, Mexico; one to the Betty O'Neil mine, Nevada, and one to the copper mine of C. Woolrich, Lower California. All who have used the hoist are well satisfied with it. The National Iron Works build all styles of hoists, having suitable patterns. The style we have described is a favorite, as it is so convenient. This outfit is kept in stock generally, and can be delivered when wanted.

THE IDAHO MINE.—This representative Californian mine (Nevada county) has just declared its 136th dividend. This \$15,500 makes a grand total of \$2,830,800 paid in dividends by the company. A paragraph has been floating about the press that the capital stock of the company had been increased to \$10,000,000 in 100,000 shares. Assuming the statement to be true, some of the papers have criticised the managers severely, and, as it turns out, needlessly. An inquiry addressed to the Secretary, George W. Hill, brought out the following reply: "No change whatever in the number of shares, Eastern papers to the contrary, notwithstanding." The number of shares is 3,100. This Idaho is not a gambling proposition. It is simply a business enterprise, owned and operated on legitimate principles by half a dozen men, who are content to divide the profits among themselves. The November product of this mine was \$41,586. Nearly \$3,000,000 in dividends has been paid since the opening of the mine. The annual meeting will take place on the third Monday in December.

THE EDGAR THOMPSON STEEL WORKS AT PITTSBURGH have lately received orders for 80,000 tons of steel rails, the demand coming principally from new roads pushing their way westward, and including the Texas Pacific, the Atchison and Topeka, Wahash and Louisville and Nashville. These rails range from 56 to 60 pounds to the yard, while the Baltimore and Ohio and the Pennsylvania roads, for all their heavier grades are securing rails which weigh 67 pounds per yard. It is estimated that the Edgar Thompson works alone in 1881 will roll 120,000 tons of rails, for all of which they have orders. These rails will supply 1,140 miles of roadway with steel track.

THE TOMBSTONE MILL AND MINING CO., of Arizona has declared the regular monthly dividend of 10c per share, payable at Philadelphia on the 15th. This is the ninth consecutive monthly dividend and the total is \$450,000.

The United States Compared With European Nations.

The total valuation of the natural wealth of the leading nations of the earth, according to the best authority, ranks as follows:

The United Kingdom of Great Britain and Ireland head the list with a capital valuation of 44,400 millions of dollars. Next comes France, with a valuation of 36,700 millions.

The third in order is the United States, with 32,000 millions.

Next follows Germany, with 22,000 millions; Russia, with 15,000 millions, and the Low Countries with 11,150 millions, collectively.

The average annual income, per inhabitant, of the various nations, makes a better showing for our own country, and presents the singular fact of an equal per capita income for both the United States and Great Britain of \$165 for each man, woman and child in the two countries. France ranks next with \$125. Then follow the British colonies with \$90; Germany,

sons with the cities of the United States. London alone, stands out in advance of any city in the United States—not only in its aggregate, but also in its actual increase of population. Apart from that city which most wonderfully maintains its supremacy by an increase of 366,000 in 8 years; the other great cities of England fall below the measure of the same class of cities in the United States. Liverpool is fully equalled by Brooklyn or Chicago. The great city of Manchester has gained only 10,630 in numbers since 1871; and that city together with Leeds and Bradford, jointly, contain a population only equal to that of Philadelphia alone. The great manufacturing cities of Sheffield and Birmingham, Liverpool and Hull, Newcastle and Bristol, which represent the commercial interests of England, have only increased 10% during the past 8 years. The great manufacturing city of Manchester has gained only 3% during the past 8 years; and it is quite noticeable to observe that the cities of Philadelphia, Brooklyn, Chicago and St. Louis are fairly running away from the ancient and historic cities of British commerce. The aggregate population of the 15 largest

is nearly as large as France, and quite as capable of supporting as large a population. If Texas was as densely populated as Massachusetts, and there is no reason why it might not become so, it would contain 52,000,000 souls. If the whole territory of the Union was so thickly settled as the State of Massachusetts, our population would reach 560,000,000. If it contained as many to the square mile as England, it would number a population almost equal to the entire globe at the present time.

Coal.

There are pretty good indications that the coal combination is coming to an untimely end. We do not know who the parties were who started in putting up the price of this most necessary article, but whoever they are, they have not been blessed, but rather consigned to regions where they wouldn't have any need for coal. Just at the beginning of winter, and when our weather cooled off so suddenly, as to warrant the belief that the winter would be as exceptionally cold as the last, we went the price of coal. The coal men evidently thought the weather was favorable. That people would remember last year and hasten to lay in a supply of fuel before the price went higher. Unfortunately for them, but fortunately for consumers, the old-fashioned rains came, with the usual California mildness of temperatures; the frost and ice disappearing before it in such a way as to gladden the hearts of all except coal men.

This gave consumers a chance to economize. They bought wood, used very little coal, and the full coal yards remained full, to the surprise and disgust of dealers, no doubt.

The Wellington coal is a favorite in this city and Oakland, and it led the market. It went towering up to \$20 a ton. But when high, it was found that people could and would do without it. And they did.

The result was sales fell off. Small lots were offered by outsiders at less than the high rates. This cutting in naturally brought the price down. So this week coal is a good deal lower than last. The rise in coasting freights which was claimed to be the cause of the rise, may have been a valid reason for raising prices a little. The people expect to be squeezed a little for one reason or another, whenever they particularly need any special article or substance. They stand these little impositions without very much grumbling. When, however, such a thing as coal is run up 25%, and then nearly up to 50%, they will not stand it. They will drop the thing altogether sooner than submit to the imposition. Freights went up a couple of dollars, while coal went up ever so many more dollars. At any rate the people refused to be swindled. The warm weather has held on so long that the coal men are getting a stock on hand bigger than they like probably. At all events, prices have begun to fall, and we hope to see them fall still farther in another week.

At the annual meeting of the Mexican Mining Co., the old management was re-elected for the ensuing year. The Superintendent anticipates that the expenses will be much lighter from this time forward, and speaks encouragingly of the prospects of the mine. The Company had \$31,092.93 in cash December 1st.

THE SILVER REEF MINER says that Mr. Tom McMasters, formerly Superintendent of the Stormont mill, has now under his control two mills of 120 stamps each, and one of 80 stamps, in Lead City; two mills at Deadwood of 60 stamps each, and one of 30, making in all 470 strong.

THE MINING DISTRICTS throughout Utah will make a good showing for 1880. Excitement has not run high in any of them, but the developments have been substantial and the production large. In refined bullion the showing is much larger than ever before.

THE NOVEMBER PRODUCT of the Standard Con. mine was \$188,720.

AN IMPROVED PORTABLE HOISTING ENGINE FOR MINES.

\$35; Scandinavia, also, \$85, while Russia, with her 90,000,000 of inhabitants, is quite out of sight. With her imperfect statistics, no reliable estimate of income can be made.

But it is in the annual accumulations of wealth that the United States far exceeds all other nations, leading off with 825 millions, while France follows next, but at a long distance, with only 375 millions; then comes Great Britain, with 325 millions, and Germany with 200 millions. The large increase of wealth in the United States since 1850, according to good English authority, would purchase the whole German empire with its centuries of accumulations, its farms, banks, cities, shipping, manufactures and mines. With these facts before the world, it is no wonder that Clare Sowell Read who, during the past year has visited this country in the interest of British industry, reported on his return that "the American nation is destined to become the greatest in the world;" or that a late number of the London Spectator should exclaim: "America excites the half-awake admiration of the world at her material prosperity!" Every day that the sun rises upon this nation there is more than two and a half millions of dollars added to its wealth.

The recent estimation of the population of English cities furnishes results which afford an opportunity to make some interesting comparisons

cities of England is 6,843,000. This includes London, which counts more than half the entire enumeration. The aggregate of the 15 largest cities in the United States is 5,654,282. Another decade will carry this municipal growth quite beyond the aggregate of the English cities, the majority of which date their importance back to or before the 14th century.

It was claimed as quite a triumph, in 1871, that there were 12 English cities which numbered a population of 100,000 or more. The present report brings that number up to 16. But the census of the United States, just completed, gives us twenty of that rank, with many others closely approaching it. If this comparison of cities was extended to the nations on the continent of Europe, it would be even more favorable for us than in its relation to England alone.

The future of the United States, when contemplated in the light and logic of statistics already realized, fairly staggers our faith. Our rapid increase in population and wealth, as shown by the census returns, is already the wonder of the world. We have all the elements for sustaining a population fully equal to that of the most populous nations of Europe. A few statistics in that direction may be interesting: Georgia is as large as England, and is capable of supporting 10,000,000 of inhabitants. California, with a little less than 1,000,000 of people,

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

A Trip Down the Coast.—No 3.

San Diego and Vicinity.

EDITORS PRESS:—San Diego carried off the prize at the last Los Angeles Horticultural fair for oranges and other semi-tropical fruits. "But where are they grown?" asks the recent arrival at San Diego, as he glances over the broad, uncultivated mesa that stretches, apparently limitless, in every direction from this city except oceanward, where, on the opposite side of the bay, the long, low line of San Diego peninsula partially interrupts this view of the Pacific. The streets run into the bay at one end, into this mesa at the other. There are no cultivated fields, orchards and gardens close to the town as at Santa Barbara; no broad vega filled with fertile farms and laughing vineyards as at Los Angeles. All is brown and sere, cactus and sumach and sage divide the ground between them, and the greenest of these (in November) is cactus. But San Diego county is large, and there are farms in it which can be found by riding or driving far enough. Indeed, some are not far away, but they nestle in valleys invisible at a general glance.

East of San Diego,

Or rather southeast, lie in the order named Cholla, Spring, Paradise and Sweet-water valleys. All these are the beds of streams which either did exist, or do exist during some period of the year. I visited Cholla and Paradise valleys, Cholla, pronounced by Californians as if spelled *Choya*, is simply Spanish for a kind of cactus which abounds in that valley. Portions of the long, narrow strip that lies between the banks formed by the surrounding mesa are highly cultivated, and some pleasant residences occur at intervals. The soil, though tolerably rich, is mixed with stones and might be called gravelly, so that it is considered inferior on the whole to Paradise valley, where an alluvial deposit of considerable depth ensures good crops wherever water is furnished. There are 27 wind-mills in Paradise valley, all of the vertical pattern. The horizontal or turbine wind-mill either has not been introduced, or does not find favor. Most of

Paradise Valley is Richly Cultured,

And ground within and around it is held at a high price—from \$100 to \$300 per acre. At Mr. Ailesworth's, I was shown a terraced hillside covered with vines, and was assured that though they had not been irrigated or cultivated for the last two seasons, they had borne freely. But these vines were on the southern slope of the valley, thus having a northern aspect and gaining all the moisture possible. No care need be taken at San Diego to ensure a sufficiency of sun. The principal orange crop is in January, but oranges, lemons and limes ripen all the time. I am assured that in some cases oranges have been left upon the trees until the year following that in which they ripened, and have then been found to be passably good oranges, though somewhat inferior to new ones. The guava succeeds well, and its pleasant acid fruit is now ripe. Olives, bananas, palms, figs joined to more ordinary strawberries, tomatoes, etc., complete the principal features of this garden in the midst of the wilderness, forced by the aid of water from a soil which needs but moisture to be fertile. The wells in the valleys cannot be called artesian. The water-bearing stratum in Paradise valley is reached at about 40 ft. The particulars of one well are as follows. A four-foot hole was dug to a little more than 40 ft. in depth, when the water was reached. Thence it was continued downward some 17 ft. more, gradually widening until at the bottom it was eight ft. wide, thus forming a sort of subterranean reservoir with 17 ft. of water. The digging of this well, the curb, bank and its woodwork, pump and wind-mill cost some \$500. Another well on the slope of the hill cost rather less. Add to this the cost of the ground at its lowest price named above, the fencing, cost of trees and planting, and it is evident that it takes some capital to commence the raising of semi-tropical fruits. Then it must be remembered that an average orchard needs six years to produce, and eight to come into full bearing. Meantime this orchardist must grow something else for a living. By huddling on yearling stocks, fruit may be obtained in the second year, but I am told that the ultimate results of this prematurely forcing production are not favorable. "We think this the next thing to paradise," remarked a young lady acquaintance, but I observed that she dressed like other daughters of Eve; also that the frost had touched the fig leaves so that some of them were no longer fitted for aprons. The same invisible hand had nipped the bananas and driving at 10 A. M. was so cold that an overcoat was needed. November is always the coldest month of the year in southern California, but this year it is something extra, corresponding to the cold snap that is now passing through the whole country. At eight o'clock on

A Semi-Tropical Morning,

In this semi-tropical climate every inmate of the hotel was warming his hands over a semi-tropical stove; my friend, Von Blank, wore a handkerchief round his semi-tropical throat,

cidedly husky, and when I requested the young lady at the post-office to forward my letters to Los Angeles, she whispered "yet there," in a moist sort of manner. On the whole, this raising of semi-tropical fruits seems an uncertain kind of business; you put a fortune in the ground and wait; if the season is good and there is a market, you may get a living out, but how when the frost comes? How when the heated sorocco from the Colorado desert blows over the land, baking the fruit upon the trees? How when the supply exceeds the local demand, and only such fruits as can be dried or preserved at a profit can be utilized? Figs, I was told, do not pay to dry. The market of San Francisco can be supplied with figs from nearer at hand, it does not pay to freight them from San Diego. Olives, however, are in demand for oil and for pickles beyond the supply. It is this vine that will be the salvation of San Diego county. Hillsides and mesas, unfitted for oranges and bananas, will grow the grape luxuriantly, and this season grapes were sold in San Diego at \$20 per ton. Near Paradise valley are some ranches on the

Highlands of the Mesa.

By dint of great expenditures and careful cultivation they are said to be tolerably profitable, but it is noticeable that, although almost every one at San Diego will tell you that mesa land is good (some will say it is the best), scarcely anyone is cultivating the mesa, while solitary deserted cabins, broken fences, and a forlorn gum-tree or two remain here and there to show where the attempt has been made. All huddle in the sheltered valleys—they say the frosts take the valleys first, and that winds sometimes sweep through them, but the experience of my own skin tells me that the banks are a wind-guard, and, until trees can be grown, they are the only wind-guard in the comparatively low districts near the sea.

This shelter, the better soil, and the greater proximity of water, as well as the greater certainty of finding it, will always make the valleys worth more than the mesa.

Though low compared with the distant mountains, with San Miguel, that lifts its head high above the rest of the Cajon range that bounds the view eastward, or with the apparently flat-topped table mountains that loom to the south in Lower California; the mesa is tolerably high land, and is not level, as any one will find who hotanizes in the barrancos, or stumbles into the dry bed of a stream in the effort to reach a friend's house by walking across lots. Back of the town it rises into quite a hill, and here, say the prophets, and the wise men, and the counsellors (of whom there are no lack), will be the best part of the city.

Back Among the Hills,

Are large ranches, where agriculture in great measure takes the place of fruit growing. In the Cajon valley thousands of acres are sown with grain, interspersed with orchards. Here there is a lack of brackish water. This valley is more than 20 miles away, but is spoken of by the San Dieguenos as close to. In the same way they speak of Campo, and of the Hot Springs (which are said to be really running springs), and of Julian, some 40 miles away. The country is so large, you know, and as the people all keep a huggy or spring-wagon, and apparently spend half their time in driving, 20 miles is a mere bagatelle. I ought to have gone to the Hot Springs—it would have been so curious to see running water in San Diego county. San Diego river runs sometimes. It has evidently, somehow, silted up the northern end of the bay with mud-flats, and evidences of its wild fury can be traced at old San Diego, where the stream washed away its banks close up to the heat garden of that place.

Old San Diego is some few miles from the new town, and the San Diego river-bed stretches beyond the former place. When there is water in it the Indians wash their clothes there—presumably at other seasons said clothes remain unwashed. In the mountains the San Diego river exists, and water can be obtained in the valley, as in the valleys before mentioned, by digging. Like "sullen Mole," it "runneth underneath." The San Diego water works are in this valley, about two miles above the old town. The water is obtained from wells.

Botanical Notes.

Cholla valley is a good place to hotanize in, especially at its upper end, where it has not yet been cultivated. Here five species of cactus can be obtained with little trouble. Four of these are *opuntias*, having cunningly devised barbed spines on branch and fruit; spines that choke where they touch, and are painful. The cholla proper, *O. prolifera*, has cylindrical joints with bunches of small green fruit at their tips, and grows tall; 10 or 12 ft. high or more. *O. Serpentina* has similar but more slender branches; grows nearer the ground, and does not bear its fruit in bunches. *O. occidentalis* and *O. engelmanni* have flat joints of ovoid form, and edible red fruit; that of the former larger than that of the latter. It is a shame to allow so much good fruit to go to waste. They have a very pleasant, sub-acid taste, and make good preserves and good vinegar. The novice who tries to eat one will remember it. I remember it. I peeled the fruit with my knife, and bit at it. Some of the barbed bristles of the skin had been transferred to the pulp by the knife blade, and at once transferred themselves to my tongue and palate. I ate no more that time, but commenced a frantic endeavor to get rid of this little barbed plague,

killed me. Next time I tried the regular fashion. With a bunch of twigs I whipped off every spicule until all was smooth; then I peeled the fruit and ate it in peace. The Indians whip them, then sing them in a fire to make sure, and then peel them. This cultivated *opuntia*, or Indian fig, of the Missions and of some old Californian gardens, was introduced, or rather re-introduced, by the Spaniards. The fruit is yellow, and similar to that of this wild species. I remember once paying six pence for one in Covent Garden market, London, as a curiosity. It is called *tuno*; this olive is the *acetuno*, or oil tuno. Another cactus is commonly called the Turk's head; by hotanists, *echinocactus*. It is simply a green round-topped mass set with long, bent spines, and bearing at the crown, at this season, a bunch of yellow fruits. The only use I ever heard of for it was as a source of Indian fish-hooks. Few of the plants conspicuous here occur round San Francisco, but among those few is the red-berried *Heteromeles arbutifolia*, commonly called holly. Upon the leaves of this plant occur the same, or apparently the same, black mildew or exudation that attacks the oranges, accompanied by the same *coccus*. Two evergreen sumachs, *Rhus laurina*, and *Rhus integrifolia* are common, looking like small oaks, were it not for the flower. A scrub oak and a cherry accompany them.

Another strange plant was first described by Mr. Cleveland, of San Diego. It belongs, like the ceanothi and the so-called coffee tree of the hills near San Francisco, to this huck-toon tribe, but has no leaves, and is entirely a mass of green twigs, each one of which ends in a spine. A singular hush, full of yellow flowers even now, yet bearing at the same time an abundance of seed vessels of an elongated heart-like shape, each containing some 8 or 10 beans, is known as the *Isomeris arborea*, and is the only representative of its family, the Cappariaceae. Artemisia, or sagebrush, and large plants of the labiate or kindred orders which are indiscriminately entitled "wild sage," are common. In some situations a gourd, *Cucurbita perennis*, bearing a round yellow fruit resembling a large orange, is abundant. At first sight I thought the orchardists had been throwing out hushel after hushel of some useless kind of oranges. The root is sometimes used in medicine.

From the few hotanical notes given, it will be seen that this arid region is, even in November, not without enough of plant life to give it interest, and I am told that the few plants, and still fewer flowers, now visible give no idea whatever of the rich luxuriance of blossoms that carpet this now desert-looking mesa after the spring rains. "I thought the flowers beautiful in spring on the hills near San Francisco," said a lady, "but they are nothing in hearty and variety to those found here." So it is no wonder that hees succeed in an almost boundless area covered with flowers in spring, and even in November not absolutely flowerless. No wonder that San Diego reckons honey among her principal exports and her most reliable sources of profit.

W. N. L.

Financial Condition of Mining Companies.

The financial condition of the subjoined mining companies on the first of December was as follows.

Cash on hand.—Con. Virginia, cash, \$36,524; Con. Virginia, unsold bullion, \$85,908.70; California, cash, \$20,227.13; unsold bullion, \$52,005.90; Mexican, cash, \$31,092.93; Contention, \$241,897.86; Standard, \$110,709.90; Bulwer, \$7,523.83; Bodie, \$21,773.62; Mono, \$2,000; Andes, \$20,908.46; Savage, \$20,141.91; Northern Belle, \$176,222.91; Alpha, \$8,962.52; Chollar, \$6,490.19; Silver Hill, \$421.50; Gould & Curry, \$22,466.45; Occidental, \$8,862.60; Exchange, \$16,328.68; Leeds, \$1,098.34; New York, \$7,048.30; North Belle, Isle, \$2,946.62; Navajo, \$197.29; Ward, \$110,477.43; Steep Hollow, \$1,859.06; Mammoth Bar, \$1,809.14; Fresno Enterprise, \$10,919.97; Mt. Potosi, \$1,837.36; Northern King, \$270.94; Tioga, \$6,000; Summit, \$6,500; Double Standard, \$2,393; Hale & Norcross, \$12,392.20; Betty O'Neil, \$134; Mt. Diablo, \$26,279.88; Belding, \$1,554.14; Kentuck, \$5,525.09; Caledonia, \$8,167.68; Watt Blue Gravel, \$915.70; Overman, \$2,890.89; Alta, above liabilities, \$13,393.97; Benton, above liabilities, \$37,564.12; Silver King, \$132,518.67; Tip Top, \$71,388; Justice, \$8,658.29.

The following companies had an indebtedness as follows: Julia, \$30,930; Union Con., \$75,477.03; Bullion, \$251,739.16; South Bodie, \$1,452.14; Black Bear, \$1,433.86; Paradise Valley, \$2,678.73; Lady Washington, \$6,972.32; Bechtel, \$98.97; Sierra Nevada, \$41,632.36; Holmes, \$81; Belmont, \$7,627.77; Scorpion, \$7,590.50; Head Center, \$32,492; Modoc, \$17,715; Day, \$1,433.49; Independence, \$1,530.83; Belle Isle, \$2,709.13; Grand Prize, \$23,407.07; Crown Point, \$5,028.18; Albion, \$8,398.27; Argenta, \$3,152.27; St. Louis, \$360.68; Equator, \$5,081.83; Metallic, \$6,255.21; Best & Belcher, \$14,296.52; Con. Imperial, \$14,612.48; Potosi, \$20,349.43; Chollar, \$2,216.93; Utah, \$23,815.95; Ophir, \$22,407.22.

The total amount of bullion shipped during the past month, by Wells, Fargo & Co.'s agent in Nevada City, amounted to \$106,500.

THE *Bentonian* calls the miners, leaving Bodie and thereabouts, for Arizona, "exodus."

Two Kinds of Mining.

While the future of mining stock speculations and of stock companies is extremely doubtful, that of legitimate mining is not. The reasons are obvious. This form is largely dependent on excitement, on unusual productions, and on the speculative inclinations of the public. The latter is sustained by hard money taken from the ground in paying quantities—by something as substantial as the precious metals themselves. Mining can be carried on without regard to the condition of stock markets, when mineral veins are worked simply for what can be made out of them, and not used as decoys for making money out of the general public.

The enlistment of capital in mining, in opening up new countries or in any profitable or promising undertaking, great or small, is creditable and meritorious to those who engage therein, provided this money so secured is used solely for the best interest of the enterprise in hand. It should be used wisely and carefully, and not wasted in the many foolish schemes that suggest themselves to the minds of inexperienced managers or directors. Money is ostensibly raised for the purpose of bringing a mine into paying condition, or to furnish it with hoisting works or reduction works, or all three, in case they are needed. Consequently, the resources of the company treasury should not be wasted in other ways nor used extravagantly in any quarter. More than this the mine should be developed steadily, and as much as possible for the payment of dividends at regular intervals. It is where the reverse is the case, where a mine's contents are concealed, its stock depressed and discouraged investors led to sell out at low figures, that legitimate mining has no place.

There are many cases where capital is needed in mining enterprises. In one instance it may be absolutely necessary to place a deserted and water filled mine in proper shape. In another its main advantage is in expediting matters, enlarging production and in reducing expenses. Such investments are advantageous and reasonable where the value of the mines have been properly tested. But the mining industry suffers severely from investments made on properties either worthless or of too limited a character to repay the outlays. The East is full of companies organized on such properties, and more propositions of like nature are now awaiting the decision of moneyed men. The main object in such schemes is to stock them as high as possible and sell off the stock before the worthlessness of the mines are ascertained. In this way the original seller and the Eastern operators, who have taken hold of the affair to enrich themselves and rob their neighbors, are enabled to rake in quite a pile of money while the stock investors have only their experience and a lot of worthless certificates to obtain consolation from. Such operations and the conducting of mines in the interest of stock manipulators are continually tearing down the good reputation the mining industry acquires from steady and uniform product, profits or dividends in other quarters.

That mining has been extremely profitable in many localities cannot be disputed. The building up of States and Territories in the Western wilderness within a few short years are evidences of this fact. Gold and silver mines have been found that have enriched men and communities. Large and increasing populations have been sustained from their products, and towns and cities, with all the accompaniments of civilization, have resulted as the natural outgrowth. Many localities can be named where the amount of capital received in a decade or two, or from the time of the first discoveries, has been insignificant, and that applied in so worthless a manner as to be of no benefit. The localities referred to here have grown to their present unflinching producing capacity of millions per annum within a very short period of time. In one case it may be two years, in others 10 and in others twenty. This advance guards who made the first discoveries were, as usual with prospectors, poor in purse. Since then thriving populations have succeeded them, with resources and productions sufficient to induce capitalists to build railways over almost impassable mountains to reach them. In many of these flourishing mountain towns are banks, where the miners' aggregate deposits range from hundreds of thousands of dollars up into the millions—and all accumulated from labor in the mines within 2, 10 or 15 years. More than this, much money is continually being used in prospecting and developing, or in what may be called experimental work, while other sums are sent away to families or friends in the East or in Europe. Such results are evidences of legitimate mining.—N. Y. Indicator.

BISBEE DISTRICT.—There can be no shadow of a doubt of the permanency of Bisbee as a mining camp, and it is having a veritable boom. There are now fully 500 people in the camp. Fifteen or 20 wooden and four adobe buildings are being erected, and there are four restaurants, four stores, two butchering institutes, and this usual number of saloons in full blast. Strange to say, there is no lodging-house as yet, and strangers who have no friends or acquaintances in town have to do some tall skrimishing for a place to lay the head when the shades of night fall. Bisbee is singularly quiet for a new mining camp, which state of affairs is undoubtedly due to the stern justice dispensed

MECHANICAL PROGRESS.

Government Report of the "Anthracite" Trial.

We have already alluded several times and at considerable length to the recent experiment of the little English steamer, *Anthracite*, and to the interest felt therein by mechanics and engineers in this country. The Commission of Engineers of the U. S. Navy, who were appointed to make an experimental trial of her capacities and economies while she was in New York, have just made public their report, the following being the results obtained after a 24-hours' test at the Brooklyn navy yard:

Total quantity of coal consumed.....	4,400
Total quantity of feed water pumped into boiler.....	35,114
Average steam pressure in boiler.....	310½
Average vacuum in the condenser, in inches.....	29½
Average pounds of coal consumed per hour.....	183½
Average pounds of coal consumed per hour per square foot of grate.....	11.98
Average indicated horse power.....	67.7081
Pounds of coal consumed per hour per indicated horse power.....	2.7115
Pounds of feed water consumed per hour per indicated horse power.....	21.63875

The owners of the *Anthracite* had put forward the great economy of fuel possible as the principal advantage of this (the Perkins high pressure) system, claiming that they practically obtained one horse power per pound of coal per hour, whereas about 2½ lbs. of coal per horse power per hour is required in some of the best patterns of marine engines and boilers. The radical change which such success as this would cause in all steam engineering must at once be perceived, and the preliminary trials made in England, as well as the practical demonstration of the system afforded by the voyage across the Atlantic, seemed to bear out the conclusion that something at least approximating to what was claimed for this machinery had been obtained, under circumstances which made the tests substantially complete. But it will be seen that, in this trial, so far from obtaining one horse power per pound of coal per hour, it requires nearly 2½ lbs. of coal per horse power per hour. This result is attributed principally to the fact that the steam pressure was comparatively low, only 316½ lbs. to the inch, while in the trials under the direction of her owners, the steam pressure was maintained at 450 lbs, which high pressure is claimed to be the principal source of economy. Her machinery was, moreover, especially adapted to work constantly at a pressure as high as 500 lbs. without any undue strain or wear. A further explanation of her apparent want of success at the navy yard is found in the fact that Cumberland bituminous coal was used in the trial, while Nixon's steam navigation coal was used in the English tests.

One object of the voyage of the *Anthracite* over here was to test the capacity of her machinery with the employment of different kinds of coal. The furnaces had been theretofore worked principally without any artificial blast, although she is fitted up with a fan blower to be used for obtaining high pressure, or should it be desirable from the nature of the fuel. It was especially intended to experiment with anthracite coal, but it will be readily understood that, in experiments with these different kinds of fuel, extending over only a brief period, the economic results obtained are not to be fairly compared with what might be achieved under a longer experience. No speed trials were made.

It is much to be regretted, in view of the great importance of the matter, that the experiments were not continued long enough, and under the proper conditions to fairly and practically demonstrate whether the Perkins will or will not do what is claimed for it.

HEAT WITHOUT FIRE.—Prof. Wells, of the Massachusetts Institute of Technology, has invented a machine for heating railroad cars without the use of fire. The principle of the machine is friction. It consists only of an iron cylinder two ft. long and one ft. in diameter, having a fixed plate of hardened iron in one end, and a second plate, attached to a revolving shaft, which presses lightly or closely upon the fixed plate, as circumstances require. The cylinder is filled with water, the shaft revolves, and from the friction of the plates, the water in an incredibly short time is heated, and by means of pipes can be carried to great distances for heating purposes. The construction of the machine is such that it is easily adapted to every place where there is waste power, as in mills, factories, public buildings and cars. Thus, to carry a machine with 36 square inches of friction plates—the ordinary size—one-half horse power only is said to be required, while a machine with 225 square inches of friction surface will require only four horse power, and will heat a room 60x200 or 126,000 cubic ft. In steam cars the machine is easily and cheaply adjusted to the axles, the power being taken directly from the wheels, so that in case of accident, all danger from fire is eliminated. This machine has been in practical operation for some months, and it is claimed that with 36 inches of friction surface a room of 10,000 cubic ft. can be heated more uniformly and quicker than by the use of coal, wood or steam, and absolutely without expense save the wear of the friction plates and the pitance for extra coal under the boiler.

The Fluorine Steel Process.

More than 20 years ago Mr. Henry Bessemer started this world with his method of producing steel without fuel, or, rather the use of this carbon in the pig iron as the fuel for its conversion into steel. Mr. James Henderson now proposes to do an equally startling thing in steel making, viz., to make a ton of steel cost less than a ton of the iron from which it is made. His idea is to remove the phosphorus in a merchantable form, and then sell the phosphorus for more than enough to pay the expense of the removal of all the impurities from the pig iron and its conversion into steel. He has recently devised a furnace for the manufacture of steel by his process. The peculiarity of his process consists in the removal of silicon and phosphorus from the iron by the agency of the fluorine in fluorspar. The furnace is an open-hearth with a revolving bottom, similar to the Perot, with the gases generated and burned by a forced blast. The Siemens regenerative system is dispensed with, and instead the heat of the waste gases is utilized in a pre-heating chamber, in steam boilers, and to heat the blast. Mr. Henderson claims that his process will make steel cheaper than the Bessemer.

The lining of the hearth is composed of magnesium lime, which may be applied in the form of dust or fluor mixed with 2% of fluorspar, and he hardened by the heat of the furnace, similar to making a bottom with sand; or they may be mixed with molasses and applied plastic, and is ready for use as soon as it dries. The purest dolomite is preferred for producing the magnesium lime, and if it does not contain 45% of magnesia it will be well to add enough magnesia to give this proportion.

If Mr. Henderson can succeed in removing phosphorus even at double the cost which he estimates, his invention will prove a most valuable boon to the steel industry.

Sensitive Railway Metal.

The accidental displacement of rails is known to be a fruitful source of railway disaster. The rains and floods of winter usually occasion the mischief, but it seems that the "iron horse" has an even more insidious enemy than accumulated storm water to threaten it and to imperil its swift career. The danger in question is one, moreover, that those who can restrict their railway traveling to serene summer time are not exempt from. One day last week an excursion train was jogging on its peaceful way on the Caledonian railway, at the rate, fortunately, of not more than 15 miles an hour, when on approaching Auchinraith, the engine suddenly left the metals, and sliding down an embankment about 10 ft. deep, turned and lay on its side, dragging with it a composite carriage and part of the next one, the remainder keeping their position on the line. The driver and stoker were badly scalded, and several persons more or less shaken, but no lives were lost. Investigation into the cause of the accident showed that the rails, which were of steel, and of the heaviest kind made, had "hugged," owing to the heat of the sun; and further examination disclosed the startling fact that at a point only 40 yards distant from the first disturbance, and on the down line, the rails were bulged 8 inches from their original position, carrying the sleepers with them. The bent rails were preserved for the government inspector, who will, no doubt, give the matter the attention it deserves, especially as regards the quality of the metal of which the rails are composed. There are all manner of new and improved processes for the manufacture of railway running gear, and it may possibly be found that some sorts of steel are more sensitive to solar heat than others. Anyhow, it is to be hoped that the eccentric behavior of the metals at Auchinraith is capable of explanation.—*London Graphic*.

AN ELECTRIC HAMMER.—Messrs. Siemens & Halske, the well-known German electricians, have brought out a novelty, the electric hammer. The device consists of three hollow coils of insulated wire, having a movable core or rod of soft iron, which is free to move up and down under the axial attraction of the coils when a current circulates in them. The central coil is traversed by a constant current, which magnetizes the rod or hammer, and the two extreme coils are traversed by alternating currents from a dynamo-electric machine in such a manner that they alternately attract and repel the magnetic rod up and down so as to make it heat like a hammer. The range of blow is limited on one side by a spiral spring placed within an elastic cushion. Of course a very great rapidity of action can be given to the hammer, while the arrangement is apparently applicable to working a rock drill.

ANTHRACITE ASHES FOR EMERY PURPOSES.—A manufacturer whose business requires the use of large amounts of emery, has been trying an experiment with the ashes of anthracite coal, and affirms that he has got good results from the ashes as a substitute for the finer grades of emery. He took ashes and saturated them with water, the liquid being poured off after standing an hour or two, then being poured off again, and so on until he obtained several grades, down to a substitute for emery flour. When dried the deposit cuts readily and leaves a satisfactory surface. So says the *Coal Trade Journal*.

SCIENTIFIC PROGRESS.

The Utility of Arctic Explorations.

Chas. Walcott Brooks, in his interesting paper on the Arctic regions read before the Academy of Science on Monday last, remarked as follows on the utility of Arctic explorations: To the few who question the value of Arctic voyages, a brief outline of their utility may be needed. Dr. Benjamin Franklin, one of the wisest men born on this continent, was in 1753 one of their earliest advocates. Abroad we have seen British, Germans, Austrians, Swedes, Norwegians and Dutchmen taking part in polar explorations. Their results are very varied. Their constant observations aim at the discovery and seek needed information to aid the correct demonstration of great physical laws, necessary to advance almost every department of science, astronomy, navigation, hydrography, meteorology, including electricity and magnetism. Specimens collected for students of natural history furnish needed data for drawing correct geological analogies. The observed variations in the movement of pendulums within the Arctic circle gauge the extent that the earth is flattened at the poles. Great laws are worldwide, and a knowledge of the whole earth is essential to their perfect understanding. Such knowledge increases the effective powers of man by augmenting his mental resources, and thus accelerates scientific discoveries, useful in arts, agriculture, commerce and manufactures. In the climate and winds of polar regions the world has obtained a partial clue of fundamental laws regulating the motor agents of atmospheric currents, and the equalizing influence of warm, gulf and icy streams, that traverse oceans as arterial rivers. How general will be the benefits bestowed when our national Weather Bureau, assisted by such knowledge, is able to apply wider rules of judgment and more surely predict the probabilities of approaching storms and seasons, one week in advance more certainly than in now ventures to forecast a single day. In Boothia, the two Rosses found the magnetic pole, whose mysterious influence the mariner's compass obeys. The mass of observations collected on all sides of this magnetic pole, have assisted science to perfect our knowledge of the laws of magnetic declination and dip. Providence has peopled these high latitudes with human beings, who winter and summer there, as well as animals on which they subsist. Each successive voyage has swept away some old error, and brought to light new phenomena, tending to advance human knowledge. The problem of a northwest passage around North America is not one of direct utility, although the gain to commerce through such scientific expeditions has doubtless been very great, yet difficult for the masses to always comprehend. Their authentic surveys are valuable to our whaling interests, annually representing many millions. The northeast passage around Asia, accomplished by Nordenskjöld, in 1878-79, promises large rewards to both science and commerce.

DECOMPOSING STEAM IN A GLASS TUBE.—Dr. Leffmann, in the *London Chemical News*, states that, as a lecture experiment, by substituting magnesium for iron the decomposition of steam may be shown in a glass tube. A yard or so of common magnesium ribbon is placed in folds, in a hard glass tube, in such a way that the metal touches the glass in a number of points. One end of the tube is drawn into a pretty wide jet, the other is attached to a flask of water. Steam is produced, and allowed to flow until air is expelled, and the apparatus heated sufficiently to prevent condensation at the mouth of the jet. The metal is then strongly heated at the extreme end. After a few moments it takes fire, burning brilliantly, and the escaping hydrogen may be lighted at the jet. It is best to keep the metal quite hot throughout. The magnesia produced is dense and crisp. It may possibly be partly hydrated, but this has not been determined. The experiment, besides being a striking one, is interesting as showing a body acting as a supporter of combustion, and becoming itself converted into a combustible.

SOMETHING CURIOUS ABOUT GLUCOSE.—A foreign pharmaceutical journal states that it has recently been discovered that a minute fungus, *Mucor circinelloides*, common in horse dung, will cause fermentation in solutions of glucose, while it does not affect that of cane sugar. This fact has been taken advantage of to separate cane sugar from molasses, the glucose undergoing fermentation, and thus allowing the cane sugar to crystallize out.

WHAT IS AGRICULTURAL CHEMISTRY?—Dr. J. H. Gilbert, in his address to the Chemical Section of the British Association, asks this question, and answers it as follows: "It is the chemistry of the atmosphere; the chemistry of the soil; the chemistry of vegetation; and the chemistry of animal life and growth." This is sufficiently comprehensive, but none too much so.

LUNAR GEOLOGY.—J. Landerer has submitted to the Paris Academy a work in which he seeks to determine the lithologic character of our satellite. He thinks that the density of the moon and the angle under which it polarizes the light of the sun are such as to show that the materials of the surface are analogous to those of the siliceous rocks.

New Method of Analyzing Metals.

Perhaps the most important information presented at the late meeting of the National Academy of Science, in New York, was Prof. Wolcott Gibbs' new method of analyzing metals by electrolysis. His plan is to place the metal in solution in a beaker, add pure mercury, and connect the mercury with an electric battery. By the electric action the metal was thrown down upon the mercury and the beaker before-hand, and then after the process to determine the metal by again weighing the vessel and the mercury. This method, he said, was applicable to mercury, tin, cobalt, and other metals. It did not apply to arsenic and antimony. He did not despair of separating potassium and sodium by the process, although his experiments with these metals had not been completely successful.

Prof. Hunt said this process came with the beauty and force of a revelation; its simplicity recommended it. Every chemist would await further developments with great interest. He also asked what battery power was used. Prof. Gibbs said the power of the battery was immaterial, except in point of time. The stronger the power the shorter the time required for the process. With a power equal to a Bunsen battery of 40 or 50 cells he had precipitated 15 grams of zinc from a solution in from 20 to 25 minutes. A battery power of two or three cells would probably precipitate three or four grams of zinc in an hour.

The Photophone in Science.

It was noticed some time since that Prof. Bell, immediately after the first public announcement of his discovery of the photophone, took his departure for Europe, to personally make known his interesting discovery to scientists on the other side of the Atlantic. He has already been heard from. It appears that the Professor and M. Janssen, a well known French scientist, have jointly undertaken a series of interesting researches, in order to apply the photophone to the study of solar physics.

The idea first suggested by Prof. Bell, of employing his new instrument for the transmission of sound by light, is to gain some knowledge of the sounds which accompany the tremendous movements of gaseous and other matter known to take place in the sun. Some direct explorations of the sun's image, conducted at the observatory at Meudon, France, were not very successful, but they held out enough encouragement of ultimate success to induce Profs. Janssen and Bell to persist in their efforts in this direction. M. Janssen thinks a better way would be to pass a succession of solar photographs of the same "spot" before an object-glass, casting conjugate images on the selenium. These photographs would be taken at intervals great enough to give notable variations in the constitution of the spot; and thus would be condensed into a short time, variations which in reality took place too slowly to affect the selenium as they occurred.

DEATH OF A DISTINGUISHED SCIENTIST.—Prof. James Craig Watson, director of the observatory of the State University of Michigan, at Ann Arbor, died recently at the age of 42. Prof. Watson was one of the greatest of American astronomers. He was born of American parents in Elgin county, Canada; graduated at the University of Michigan in 1857, and was elected Professor of Astronomy there in 1859. He wrote a popular treatise on comets, a work on theoretical astronomy, and numerous contributions to scientific journals. He has discovered a good many asteroids, and in 1870 received the astronomical prize from the French Academy of Sciences. Prof. Watson spent some time in this city on his way to and in returning from his trip to Japan to observe, from that point, the transit of Venus, in 1874. At that time his party was unable to accomplish much, on account of bad weather; but he was more successful in a subsequent visit to this coast to observe the last total eclipse of the sun. On that occasion he announced positively that he saw one, if not two, intra-mercurial planets. Prof. Watson was the author of several works on astronomy.

THE GULF STREAM.—At the late meeting of the National Academy of Sciences, in New York, Prof. J. E. Hilgard read a paper on "The Basin of the Gulf of Mexico," in which the theory was stated and endorsed that the so-called gulf stream does not flow from the gulf, as has been represented in the physical geographies, but is an equatorial current which comes through the Caribbean sea from the African coast; is turned northeast upon striking the coast of Yucatan; passes through the straits of Yucatan and Florida, and out into the Atlantic, without really entering the Gulf of Mexico at all. The currents in the gulf are not connected with this great stream, and are very slow.

PHOTOGRAPHS OF THE NEBULA IN ORION.—Prof. Henry Draper has succeeded in obtaining a most accurate photograph of the bright part of the Nebula of Orion, in the vicinity of the trapezium. The photographs show the mottled appearance of this region distinctly. They were taken by the aid of a triple objective of eleven inches aperture made by Alvan Clark and Sons, and corrected especially for the photographic rays. The exposure was for fifty minutes. The Professor promises to publish, at an early date, a detailed description of the negatives.

The Mining Share Market.

Of course Alta has been the feature of the past week as it was of the previous. Those anxious for a "hoon" in the stock market have anxiously looked forward to a good ore development in this mine, which would "hoost" up the whole line; They were doomed to disappointment. As the vein was approached, danger of water was apprehended, and the apprehensions proved true ones. On the 15th "cross-cut" No. 1 on the 2050 level of Alta struck a flow of water that came with such force that it flooded the level in two hours. A rush of water followed the blast that broke into the edge of the ore body. Nothing could be seen showing the character of the vein, owing to the torrents of water and mud. The donkey pumps are working well, discharging 200 gallons a minute. The management expect to have the water out in about one week. Mining men here think the flood will not last long.

Such was the dispatch sent from Virginia City. Of course it was disastrous to Alta. Whole blocks of stock were thrown onto the market, breaking the stock down to \$4.45. Whether this is part of a "game" or not, of course no one knows. This water business may have been known for several days. The ways of stock operators are so dark that there is no reliance to be placed in what appears to be the case.

Of course, operations at the mine will be delayed. The pumping outfit of Alta is first-rate, and no doubt the mine could be easily freed of water if necessary. But it may suit the managers to keep it flooded for a few days. It will only take a very few more sharp tricks put upon the public to utterly break down all faith in the stock market. There is not very much now, but what remains, will soon be all gone.

The Oregon Railway and Navigation Co., have purchased all that property bounded by Bryant, Brannan, First and Beale streets, San Francisco, for the sum of \$310,000. The company have already commenced operations to improve it and adapt it for their business. The entire district will be laid out for the accommodation of their passenger steamers and for the vessel which will be used in their Seattle trade, as well as for the storage of their coals and all other business in connection therewith.

WILLIAM WILLIS, Secretary of the Northern Belle company, reports that the November shipments from the mine aggregated \$100,402.32. The regular monthly dividend was paid on the 15th. On December

of the stock market, but few are able to incur the heavy expense incident to the erection of pumping machinery.

NEVADA.

GOOD DEVELOPMENT.—Nevada City *Transcript*, Dec. 14: There is now said to be a continuous ledge of pay ore from the 1st to the 9th levels of the Klailung Sun mine, the richest part being found to the east. Since 1867, the mine has yielded nearly \$2,000,000, and has been a steady dividend payer nearly all of that time.

THE V FLUME EXTENSION.—The ditch from Bear Valley to the mill of the V Flume company at the Cascades has been blocked with snow since the late storm, causing a suspension of sawing operations. A force of men have, however, been busily engaged in clearing the ditch, and it was thought that the machinery could be started up again yesterday. There are about 1,200 logs yet uncut that will be disposed of this winter. Under Mr. Dunn's constant personal supervision, the enterprise is proving an encouraging success.

WILL EMPLOY CHINESE MINERS.—The Manzanita mining company, whose hydraulic claim is situated in the northern edge of the city, will soon begin washing. Twenty-five Chinamen will be employed at \$1.30 a day each, and the Mongolian foreman will receive the stupendous salary of \$2 a day, as we are credibly informed. The wages of the white miners in the district range from \$2.50 to \$3 a day, foremen generally get \$3.50 or \$4. At the same time the majority of mining companies say they have learned from experience that, all things considered, white miners are cheaper at \$3 a day than Chinese at \$1. We are sorry that the Manzanita company is of a different opinion.

BEAR VALLEY EXTENSION.—The Nevada mining company, of New York, is actively engaged in making preparations to resume work on the Sheath & Clay quartz mine in this district, which property yielded fabulous dividends a few years ago, but has for some time now been idle. The machinery of the holding works and mill is being reset, and lumber has been delivered with which to make necessary repairs and build a flume.

THE GULCH EXTENSION.—The pump and mill put up by Mr. Gillespie on the Cornish ledge, Gold Butte, are idle on account of the short supply of water being carried by the Idaho ditch at present. As soon as sufficient water can be obtained, work will be resumed in this sterling little mine.

DEADWOOD.—There are about 25 tons of ore on the dump at the Deadwood, and more is being taken out preparatory to a crushing. Most of it is apparently of fair quality, while in some parts of the ledge it is found to be very rich.

GOOD ORE.—The mill at the Yuba mine, in Washington township, is still kept running night and day. The ledge is about 4 ft thick and of medium grade. The ore is worked by the ordinary milling process to within 5% of dry assay. How many other mines on the coast can say much? There used to be a great deal of talk about the difficulty of overcoming the "rebellious" matter in that ledge, but actual experience proves there is nothing rebellious about it.

NEW GRAVEL MINING INCORPORATION.—T. W. Sterling, T. Houston and N. B. Walker, all of New York, have incorporated, under the laws of that State, the Nevada gravel mining company to work the old Herschman by-product mine in the suburbs of this city. They purchased the property last fall from Messrs. Colley, Herdman, Webster and Grover for considerably less than half the amount of the sum for which they have incorporated (\$65,000, divided into 65,000 shares at \$1 each), but have subsequently made some improvements. We understand that Mr. Sterling is expected daily to arrive here from the East and make arrangements to resume work, which was suddenly discontinued last season a few months after the new company came into possession.

THE CONSTITUTION.—Herald, Dec. 11: A rich strike is said to have been made at the Constitution mine, situated near the Le Compton claim, on the south side of Deer creek. The ledge is about 1 ft in thickness, and heavily charged with sulphurates. The rock is very similar to that of the Le Compton. The owners are Messrs. G. G. Allan, G. G. Allen, and G. G. Allen.

THE MURCHIE.—But few men will be employed in the Murchie mine this winter. Work will be confined principally to the new shaft. The company intend sinking 20 ft further, and will open up 2 levels before commencing operation on an extensive scale. Next spring there will be a larger force of men employed at this mine than there has been heretofore.

MOUNT ZION.—Nevada City *Herald*, Dec. 14: N. T. Treweek, one of the owners in the Mount Zion gravel claim, situated near Snow Tent, came down from there yesterday, and reports 4 ft of snow at the mine. He says that he was compelled to discharge all hands, as they had not yet prepared for a winter's siege, and were minus provisions, fuel and timber. The tunnel is now in 2,500 ft. A contract for driving it further has been let to John Dower, who will return to the mine shortly and continue the work. He will be compelled to peek his food in on snow-shoes.

PLACER.

CONTINUES RICH.—Dutch Flat *Forum*, Dec. 11: The Sucker Flat drift mine, near Iowa Hill, in which the rich chunk was found lately, we learn from August Schillbach, the owner, is still continuing its rich yield of old trunks of shelling out a few big pieces every week, besides a tolerably good sprinkling of fine gold, which latter reaches, at times, two ounces a day to the man. This mine is fast coming to the front as one of the first-class drift mines of the State.

THE CONRAD.—We were shown some very fine average ore in the other drift of W. Roberts, taken from the west drift of the Conrad on the 150 level. Some very rich specimen ore is being taken out of this drift, and which is encouraging, the free gold seems more evenly distributed through the ledge than at any former point. This 150 level has been run about 100 ft in all, 75 ft east and 25 ft west. In both extremities the ore body is of a paying character. A crushing of the rock taken out in running the east drift paid \$30 a ton, and for the last 30 ft in the west drift the ore equals the best they have taken out. They are at present driving the west drift ahead, and each it shows more encouraging developments. They have thus far done no stopping, and, consequently, are in a situation to take out a large amount of ore on short notice.

THE REX.—Supt. F. M. Chisholm, of the New Gold Run mine, informs us that the mine has been suspended since Monday, work having been suspended for some 10 days previous on account of the failure of water. The late rain and snowstorm has started enough water to run the mill and work the mine. It is thought a sufficient amount of water will run to keep the mill going all winter.

PLUMAS.

SPANISH PEAK.—Plumas *National*, Dec. 11: Supt. Smith, of the Monte Christo, called on us on Tuesday. He says the storm was terrific up at the mine, and the wind was fairly fearful. The houses are very substantially built, and he would not be worried by a strong enough to blow down the roof. The work in the mine is going on satisfactorily, and the main tunnel is being pushed forward rapidly. The crosscuts and drifts show pay gravel everywhere, and the outlook for the mine being very successful, is every day growing better. The Burleigh drift works to perfection, and adds "shoots" to the progress made in the tunnel, as it fairly "shoots" the big boulders out of the way. The company was very fortunate in not being caught in the snow with their out-door work, and had just fairly completed it when the storm came along, but now, with everything under cover, the work progresses smoothly, and they are in good condition to defy the elements. The Monte Christo will give a good account of itself in the spring.

THE SAVANNOH.—The snowstorm came a little too soon for the improvements and work on this mine, and part of the work had to be stopped for a few days. The timbers for the new mill are framed and ready to put up, and, if the weather is "half-way decent," will soon be in place. They are running 4 tunnels for the ledge, and in tunnel No. 2 they have a fine vein 4 ft wide. When they get tunnel No. 1 to the ledge, they expect to have 1,200 ft

of backs. About 75 men are employed in and around the mine.

THE LORING & LEVITT. claims still continue to yield big pay. The bad weather makes hard work for miners, as well as for all other branches of industry.

SIERRA.

AMERICAN HILL.—Mountain *Messenger*, Dec. 11: The men who were working on the Wilbourn Con. claim have quit for the present, by reason of being nearly out of provisions, and because they have struck a stratum of heavy quartz boulders which will have to be blasted. They think they are near the bedrock and pay dirt. The American Hill company has finished their ditch tunnel, which is 300 ft long. They are now prepared for spring work.

MORRIETOWN.—One hundred and thirty-five men were in the employ of the American company, of Morriestown, last week.

COMPLETED.—The Morriestown company has its ditch completed to Craig's Flume and 2 new monitors in position. They have got their lumber all up the hill, and workmen are now engaged in widening the main ditch. Morriestown is a lively camp just now.

THE BLACK JACK.—Nevada City *Herald*, Dec. 14: Notwithstanding there is 10 ft of snow at the Black Jack mine, in Sierra county, work still progresses. Up till last week the company was employing 20 men, but since the snow storm, some of them were discharged, as work will be confined principally to running the tunnel. The mill has been removed 300 ft further down the hill. The necessary arrangements for a winter's work are complete, and there being a snow-covered 400 ft in length, leading from the boarding-house to the mine, there is little danger of any obstacle in the shape of a snow-slide presenting itself which would interfere with the miners' work.

SISKIYOU.

QUARTZ.—Scott Valley *News*, Dec. 11: Last Sunday a Mexican named Gilmo Brededa was hunting on the west side of Deadwood, about half a mile from the top of the ridge, between Deadwood and Barkhouse. He shot a deer and followed it into a gulch, where it fell, and while doing so he noticed a small piece of quartz on the ground, which was freely sprinkled with gold. A little search resulted in the finding of several more pieces of equally rich float. He carried them home, and the next day, in company with John Armstrong, returned to the place and succeeded in finding the ledge. It is a narrow vein, about 10 inches wide, but is perfectly matted with gold, and is reported to be richer than the Grizzly Gulch ledge. Specimens taken from it bear out this estimate. Eight locations on the ledge have already been made, and all that is in sight or traceable has been cleared.

NEVADA.

WASHOE DISTRICT.

The following statements, dated Dec. 14th, have been filed in the offices of the leading mines:

SIERRA NEVADA.—On the 2300 level the upraise has been advanced 25 ft; total, 349 ft. On the 2500 level the main north drift has been advanced 30 ft; total length, 375 ft. The joint Union Con. crosscut on this level has been advanced 32 ft; total length, 104 ft. During the week 36 tons of ore were extracted, assaying from \$17 to \$20 a ton. The upraise on the drift running from the Union shaft to the Sierra Nevada east was here completed, and all material for the upraise is now conveyed through the drift.

OVERMAN.—Sinking the winze has been discontinued, and we have out a pump and tank station 200 ft below the 1000 level, and have the tank ready to put in. We will begin to-day to open a station in the winze 375 ft below the 1000 level. The incline upraise has been suspended, to allow the water to drain off. The Forman shaft has been sunk and timbered 15 ft; total depth, 1,555 ft.

ALTA.—No. 1 crosscut, 2050 level, has been advanced 32 ft during the past week; total length, 310 ft. About 20 ft further we will reach the ledge at this point. Crosscut No. 2 has been extended 44 ft; total length, 329 ft. The west drift, on the same level, has been carried 32 ft. Later telegraphic news from this mine is given in our "Mining Share Market."

BRISTOL DISTRICT.

BOTTOM DROPPED GET.—Pioche *Record*, Dec. 11: The bottom dropped out of the Day mine 5 days ago and left a hole in the bottom of the winze. A miner working in the bottom of the winze, known as the 460 level, suddenly engaged in picking ore early Tuesday morning, suddenly disappeared, and the bottom of the winze, and dropped the distance of about 100 ft into a large cavity of ore, on the top of which he had unknowingly been working. The miner swears that he fell a distance of 3,000 ft and that it took him an hour and a half to reach the bottom, and that he smelt brimstone on the route. The cave is very large and contains vast quantities of ore. During the week the men have been engaged timbering this portion of the mine and making it safe for them to work in, and they will to-day start in exploring this new discovery. Two assays were made of the ore, one going \$50 and the other \$37 in silver. We understand that the Day Co. are making arrangements with the Bristol & M. Co. to work 100 tons of ore for them. The Bristol Co. agrees to work the ore up to the highest percentage that they are able to, just simply charging for the working of the same. This is the first time that the mine has ever been made in this district. The general rule here with our tunnels and shafts is to have the bottom of the mine produced by custom ore and bring the owner of ores in their debt.

HILLSIDE.—The Hillside furnace fired up Wednesday, and is reported running all right. Martino says Manager Howell offers to let him take out \$30,000 inside of 30 days. They are waiting for the company to redeem its property before the 26th of January, and if it is not redeemed in time, it becomes the private property of Curtis, Howell, Blair and McGee.

COLUMBUS DISTRICT.

BORAX CONTRACT.—True *Finance*, Dec. 11: B. G. Smith, of this place, has entered into a contract with F. M. Whitaker, who is manufacturing borax at the borax marsh between Columbus and Fish Lake valley, to purchase the entire product of the manufactory for the ensuing year. Smith Bros. are the largest producers and dealers in borax in Nevada, and in addition to their already extensive works at the same place, near Marietta, Frank M. Smith has just purchased from W. T. Coleman, of Fish Lake, the Pacific Borax Works, near Columbus. This company owns an immense tract of borax country in and adjoining Columbus, and has large and costly reduction works erected thereon.

EUREKA DISTRICT.

EUREKA CON.—Eureka *Sentinel*, Dec. 12: From all sources we hear the most encouraging reports of the riches of this celebrated mining property. It is now positively stated that the company has a great abundance of high-grade ore continuous from the 500 level down to the 1300 level, and the outlook is bright. When the new experimental shaft is completed, and if it is not now some 700 ft, and the mine is in complete running order, look out for old time \$2 and \$3 dividends.

ENCOURAGING.—The Kemp & Keen series of mines have shown up some excellent deposits of ore in the recent workings, and with present prospects to go on, the owners will proceed to develop the property. Notably prominent and encouraging is the outlook in the Kemp & Keen and the Bourbon mines. The ore uncovered is of the same quality and stamp as that in the Jackson, and there has never been a doubt but that the chambers extended from the Jackson into the Kemp & Keen ground. The owners feel encouraged to go on with developments.

HOMERON MINE.—A. F. Hodgdon came in from Secret Haven yesterday, after men to work on his mine. He reports it rather a hard job to secure men of late. Instead of working on the recent ore body discovered on his property, he is preparing to work the mine systematically, and has started to drift under the last deposit discovered. A GOOD INVENTION.—We are informed that the patent tweezers, which have been introduced into the Atlas fur-

nace by Mr. Henry Allen, have proved satisfactory for the object they were introduced. The surplus production, which extended into the furnace, melted and formed a cement about the end of the tweezer, which the fires of the furnace will long be burning ere the tweezer is touched. By those who know of such matters, it is considered a success, and will prove a great saving to the castings and the furnace through the sides of the furnace which are made for the admission of the tweezers.

PIOCHE DISTRICT.

WORK AT BULLIONVILLE.—Pioche *Record*, Dec. 11: Ben. Hampton, of the firm of Godlie & Hampton, is pushing work ahead on the furnace and concentrating works as rapidly as possible. The tramways are about completed, and the sampling apparatus is in working order, the firm having commenced purchasing and sampling ore. Chlorides obtain money for ore as soon as sampled and assayed. The company has let a number of contracts for charcoal—more than they need—at 20 cents per bushel. The works will be run on a cash basis.

GOING FOR MENDING.—Joe Griffin and Bob Hanley have undertaken the task of opening the drift connecting the Washington & Creole and Mazepa shafts, which was blasted and filled by a set of vandals. They have been working at this for over 2 weeks, and it will take many a hard day's work before the drift is cleared of debris. It is their opinion that after they get into the Mazepa they can make big money, and are holding their breath.

INDEPENDENCE MINE.—The men working in the Independence mine have struck a narrow streak of very rich ore. Although the streak is quite narrow, yet it is so rich that it pays for working it.

ARIZONA.

GRAND CENTRAL.—Arizona *Citizen*, Dec. 11: Mr. E. B. Gage, of the Grand Central, at Tombstone, returned home Monday. In less than 2 months Tombstone will have in Grand Central another great bullion-producing bonanza. The 30-stamp mill, now building, will not have been completed a day too soon. The developments of the mine are such as to warrant a much larger mill. It has proceeded from a mere prospect to a great mine without any flourish of trumpets. The capital invested in its opening has been expended so quietly, yet intelligently, that comparatively little is known by the outside world of the real worth and wealth of the mine.

STRIKE IN GLOBE.—Globe has got it again. This time it was struck in the Globe, which is a claim belonging to the La Salle group. This group is located about one mile from the celebrated Cox & Coplin, and about 2 miles from the Emeline. This time he struck it as rich as could be asked for. The vein on this claim shows a large width on the surface, and the work done before only prospecting a portion of it, and with this in view, Mr. Hise started his work so as to see if the heat ore had been found. This resulted in his finding a pay streak about 3 inches wide where discovered, that is enormously rich.

NEW DISTRICT.—A meeting of miners to organize a new district was held recently. It is called Wrightson district. The boundaries of the new district were defined as follows: Commencing at a point on the Sonora creek which shall be due south of the eastern boundary of the Aztec district, and running north to the eastern line of the said Aztec district, thence north to the northern boundary of the Smith district to its southeast corner; thence southerly to old Camp Crittenden; thence along the Sonora to the place of beginning. It was resolved that the new district be known as the Wrightson. D. W. Lyons was elected Recorder for the district.

GOLD.—A *Citizen* representative, after a visit to the gold camp near Globe, last Saturday, declared his belief that in this district, that section would astonish the world with its production of the precious metals. At that time there were but two mines in the camp upon which work was being actively prosecuted—the Golden Eagle and Townsend. From a private letter received to-day we learn that the first clean-up of the Golden Eagle 10-stamp mill, after a run of 7 weeks—including the many delays in making a thorough examination of the property, and a very considerable amount in silver. The mill is an ordinary silver mill, and is thus enabled to successfully reduce the ore from the start. The neighboring mill, however, the Townsend, was constructed on the old pattern, with the sole view of saving the gold, and, as a consequence, it was found that it does not save within 45% of the value of the ore. It has accordingly been shut down and a contract has been made for its reconstruction on the plan of the Golden Eagle mill, with an addition of 5 more stamps, making it of equal capacity.

PATAGONIA.—It looks very much now as if Patagonia district, to which so many eyes have been turned as a coming great camp, is on the eve of a genuine "boom," and that on the camp's merits. For some days past several of the bonders of the famous Washington "pool" have been making a thorough examination of the property, and the result is a definite conclusion to consummate the sale. On the first of January next another installment of the purchase money, \$30,500, will be paid to the "pool" sellers, and within 90 days a 60-ton smelter will be erected at Luttrell City for treatment of the ores. This is good news for Washington camp and Patagonia, and for this result the people of that district have largely to thank Hon. J. C. Luttrell, to whose indefatigable energy much of it is due. Right on the heels of this intelligence comes the report of a new and most important strike in the Alta, near Harshaw. It consists of an unexpected development of nearly 81 ft of chlorides and horn silver, and it will probably determine the company to erect a mill for the mine instead of a smelter.

IDAHO.

GOOD GRASS.—Idaho *Statesman*, Dec. 11: From the Star mine, situated within two miles of Bellevue in the Wood river country, and owned by D. Falk and A. Wolters, there was recently shipped to Salt Lake City and sold 51-20 tons of ore, the gross value of which was \$1,240.33, or \$24.51 per ton. The lot was sold for \$331.72, which was a net of \$184.50 per ton. The 3rd shipment of ore transported to Salt Lake City, for sampling, commissions, etc., was \$204.33, leaving a net balance on the lot of ore of \$737.34. With the erection of smelters at or near the mines, which will be done next season, there would be a saving of over one-third.

DRIFT CLAIMS.—Pioche *Record*, Dec. 11: Seven drift claims are being worked in Gold Butte. On the Elk creek side a level from 3 claims is accumulating on the dumps, and by washing-up time in the spring a good many thousands of dollars will be represented in the 3 piles. The first drift, and the one working the largest force, is that of Keane & Hall. Adjoining this claim is the "French Co.," and just above this is the claim of John Martini. On the Bear Run side 4 companies—Barker & Cartwright, and 3 Chinese companies—Saw taking out good dirt. It is estimated that the Gold Butte drifts circulate no less than \$150,000 a year.

THE RISING SUN. mine never looked half so well as it does to-day. The west tunnel has been run in 40 ft since Mr. Thurman took hold of it, and the ledge varies from 18 inches to 3 ft in width of splendid rock. The shaft has been sunk 6 ft, and a drift up a fine ledge 15 inches wide. Although it is thought the Rialto Sun is the richest mine as yet in Boise county, Mr. Thurman has 5 men at work.

MONTANA.

LEXINGTON.—Butte *Miner*, Dec. 11: In the Lexington no important changes in the appearance of the ore body have taken place during the past week. The stopes in the drift running west from the 70 level are all in ore of excellent quality, and are producing about 15 tons daily.

AT THE ALTA. everything is running along smoothly. Drifts in all the levels are being pushed vigorously ahead, the quality of the product remaining about the same. The new Moulton shaft is about 10 ft deep, and a windlass is being put up. In excavating for the shaft house some very rich streaks of ore were encountered.

GRASS TO THE BREEZE. In the new machinery of the Magna Charta, the mine is at present idle. An important strike is to be recorded from the new famous Bell. Some exceedingly rich free ore was uncovered. The stopes extending east and west from the bottom of the North Star are yielding an amount of high grade free

ore sufficient to keep the Clipper mill in constant and profitable operation.

THE COLUS. continues to produce almost 40 tons of ore per diem. It is extracted principally from the face and stopes of the east drift, where some very rich copper ore pockets have been opened up.

OPERATIONS continue active on the Stevens, which is yielding an increased amount of free ore. The new shaft is being sunk as expeditiously as possible, and the ore body shows a steady improvement both in quality and width. Several shipments have recently been made to the Dexter mill.

THE NEW GPHR shaft is being sunk on the vein with excellent results. The ore body is improving in richness, and some very high assays have been made during the past week. The north ledge, on which the first shaft was sunk, is expected to come in in the course of a few weeks, so that the ore body will not only be rich, but extensive.

THE PACIFIC is fast building up a reputation as a prolific producer of the precious metal. The stopes in the east 50-ft drift, in excellent shape, and are yielding from 20 to 30 tons daily, enough to keep the stamps of the Silver Bow mill in continuous operation.

MOUNTAIN BOY are producing to the full satisfaction of the owners. In the face of each is a fine body of base ore, which is being extracted, and when the stopes are started a heavy output may be expected.

THE ACQUISITION continues to produce daily from 6 to 10 tons of very high grade rock. In the 82 level, connecting shafts Nos. 1 and 2, the appearance of the ore body remains unchanged. The double compartment shaft is down 45 ft.

ANSELMO.—Things are booming at the Anselmo. The old shaft, upon which sinking has been steadily progressing for several weeks, has attained a depth of 160 ft, and the ore in the bottom opens up in fine shape. In the 100-ft east drift, stoping is being prosecuted and several tons of rich ore is daily hoisted to the surface from that part of the mine. The new shaft, upon which a whim was recently constructed, and which is about 100 ft from the old incline, is down 60 ft on the main ledge, and is producing some of the richest rock yet taken from the young bonanza.

OREGON.

WIND-DAMS TAKEN OUT.—Sentinel, Dec. 8: Thomas Keaton and Lannes Kilpelt have finished taking out their wind-dam on Rogue river near Douda's. We did not learn the amount cleaned up by them. Mr. Keaton will mine on Poorman's creek this winter. The wind-dam on Rogue river, half a mile above Chavner's bridge, run by Chiurman, was also taken out last week. Lumber and other material used in constructing the dams, has all been placed behind the reach of the winter freshets.

BAXTER.—Ore *Advertiser*, Dec. 8: B. W. and Ralph Deane have rented Thomas Chavner's big ditch, and will engage in mining on a larger scale than ever in the Willow Springs district this season. They are now engaged in putting down a new flume. The water of this ditch was formerly controlled by Chiurman.

GALICE CREEK.—Frank Ennis returned from Galice creek the other day, from whom we learn that little rain has as yet fallen in that section. There was about 2 inches of rain, but the head of the ditches of the English and Blue Gravel companies, and two-thirds as much on the diggings. Everybody is ready, and a heavy rain is all that is necessary to set the camp in motion.

ELLIOTT CREEK.—Jacob and Lennes Kilpelt returned from Elliott creek this week, from whom we learn that there is about 1 ft of snow on the ridge. Several of the companies are still engaged in mining, while others have suspended operations for the present. The past season has not been a particularly successful one in that section, but the future promises to be better.

THE MINERS were in high glee last week, supposing that the rain would continue until they had an abundance of water. They were unfortunately disappointed, however. A heavy rain, of Rogue river, was about 2 miles away. They informed us that but little more rain is necessary to enable them to start up their pipe. They use a giant, with which they made a good run last year.

NORRIS.—Keaton & Kilpelt are getting their Poorman's creek property ready for this winter. The miners are generally prepared for water, and are anxious for a war of the elements. Green Broa, at Galice creek, have their smelter in motion, and are grinding in good quality of rock. The Applegate gravel company is now piping, and are running off considerable ground. John Goff, of Grave creek, brought several handsome specimens of quartz, as also some gold dust taken out of his claim, to town the other day.

UTAH.

SILVER REEF BULLION.—Miner, Dec. 8: The hullion shipments from Silver Reef, through Wells, Fargo & Co., for the present year up to date, foot up over \$1,000,000.

NEW MACHINERY.—The Barbee & Walker's advised of the sale of additional pans, which will be set up on arrival, thereby increasing the capacity of the mine to 200 tons per day, and the product proportionally. The Richmond air compressor will arrive in a few days and be set to work immediately on arrival, with which it is proposed to prospect the mine thoroughly. The operations of this drift will be watched with some interest, as, in event of its being a success, as anticipated, it will have the effect of producing more ore with no great increase of expense, and thereby add to the product. There are millions of dollars in low grade ore only awaiting some cheap method of working, and the day must come when those who have held on for the good time coming must be rewarded. A profit of a few dollars per ton would, in the aggregate, amount to a large sum and make this as prosperous a camp as any on the coast. It has the elements of a large degree, and all that is required is machinery, capital and enterprise to accomplish it.

The Garibaldi Mine.

A correspondent sends us the following item: "The Garibaldi mine is situated on the Stanislaus river, one mile from the Sonora stage-road. The property consists of several locations, having a tunnel 150 ft. cross-cutting the main vein, which is 15 to 20 ft. wide, all of pay ore and nearly identical with the Amador mine at Sutter Creek lying between a head-wall of slate and foot-wall of green stone. A drift 140 ft. in length shows the great strength and permanency of the vein. A large portion of the vein carries about say 10% sulphurets, which assay as high as \$245 per ton, and with free gold sufficient to pay cost of extracting and milling. Enough has been reduced in a small mill to establish the fact of a very valuable mine. The owners of these mines have been at work since 1873 opening them with a view to putting up proper milling facilities, but like many others, had more mines than capital. A small five-stamp battery is in place which will reduce but about four tons in 24 hours, while 40 to 50 tons of ore can be extracted daily from the Garibaldi vein alone. They require a 20-stamp mill with three concentrators and supplemental works; then large returns are sure to follow. All mining and milling power can be had free, by utilizing the water flowing past the mine in the Stanislaus river.

Another Common Mold.

In our issue of November 27th we gave an engraving and description of "bread mold," as it appears under the microscope. On this page we give a similar exposition of another mold which is common in household economy, and is frequently associated with the mold we described before. This is also a fungus plant, and is found on bread, on preserved fruit, also on decaying fruit, on cheese and other substances. Its scientific name is *Aspergillus glaucus*, and it is the plant which is generally meant when one speaks of "cheese mold." The well-known student of fungi, Dr. Bary, made a popular demonstration of this mold some years ago, and it is upon his description that we shall chiefly rely in explaining the growth of the plant, as shown in the engraving.

It shows itself to the naked eye as a woolly floccy crust over the substance, first purely white, then gradually covered with little fine glaucous, or dark green dusty heads. It is shown at *a* as it appears to the naked eye. More minute microscopical examination shows that the fungus consists of richly ramified fine filaments, which are partly disseminated in the substratum, and partly raised obliquely over it. They have a cylindrical form with rounded ends, and are divided into long outstretched members, each of which possesses the property which legitimizes it as a vesicle in the ordinary sense of the word; it contains, enclosed within a delicate structureless wall, those bodies which bear the appearance of a finely granulated mucous substance, which is designated by the name of protoplasm, and which either equally fills the cells, or the older the cell the more it is filled with watery cavities called vacuoles.

All parts are at first colorless. The increase in the length of the filaments takes place through the preponderating growth near their points; these continually push forward, and, at a short distance from them, successive new partitions rise up, but at a greater distance, the growth in the length ceases. This kind of growth is called point growth. The twigs and branches spring up as lateral dilatations of the principal filament, which, once designed, enlarges according to the point growth. This point growth of every branch is, to a certain extent, unlimited. The filaments in and on the substratum are the first existing members of the fungus; they continue so long as it vegetates. As the parts which absorb nourishment from and consume the substance, they are called the *mycelium*. Nearly every fungus possesses a mycelium, which, without regard to the specific difference of form and size, especially shows the described nature in its construction and growth.

The superficial threads of the mycelium produce other filaments beside those numerous branches which have been described, and which are the fruit thread (carpophore) or conidia thread. These are on an average thicker than the mycelium threads, and only exceptionally ramified or furnished with partitions; they rise almost perpendicularly in the air, and attain a length of, on an average, one-fiftieth of an inch, but they seldom become longer, and then their growth is at an end. Their free upper end swells in a rounded manner, as shown at *b* and *c*, and from this is produced, on the whole of its upper part, rayed divergent protuberances, which attain an oval form, and a length almost equal to their radius, or, in weaker specimens, the diameter of the rounded head. The rays divergent from protuberances are the direct producers and bearers of the propagating cells, spores, or conidia, and are called sterigmata. Every sterigma at first produces at its point a little round protuberance, which, with a strong narrow basis, rests upon the sterigma. These are filled with protoplasm, swell more and more, and, after some time, separate themselves by a partition from the sterigma into independent cells, spores, or conidia.

The formation of the first spore takes place at the same end of the sterigma, and in the same manner a second follows, then a third, and so on; every one which springs up later pushes its predecessor in the direction of the axis of the sterigma in the same degree in which it grows itself; every successive spore formed from a sterigma remains for a time in a row with one another. Consequently every sterigma bears on its apex a chain of spores, which are so much the older, the farther they stand from the sterigma. The number of links in a chain of spores reaches in normal specimens to ten or more. This growth is shown at *d* highly magnified. All sterigmata spring up at the same time, and keep pace with one another in the formation of the spores. Every spore grows for a time, according to its construction, and at last separates itself from its neighbors. The mass of dismembered spores forms that fine glaucous hue which is mentioned above. The spores, therefore, are articulated in rows, one after the other, from the ends of the sterigmata. The ripe spores, or conidia, are cells of a round or broadly oval form (see *e* in the engraving), filled with a colorless protoplasm, and, if observed separately, is found to be provided with a

Pacific Coast Railroads.

The annual report of the Government Auditor of Railroad Accounts contains the following passages, which are of special interest to the Pacific coast. Concerning the material condition of our principal road, the report says: "While the property of the Central Pacific Railroad Company, as a whole, is in good condition and well maintained, there are some things mentioned by the Government Engineer, which seem to require notice. A good many small girder bridges have their masonry in poor condition, and should be rebuilt. Temporary trestle approaches to bridges in the Sierras should be done away with. The supply of steel rails for renewals on the main line has not kept up the deterioration of the old iron, so that there are a few badly worn pieces. The Engineer considers it important, and with good reason, that switches in the snow galleries, and on all that portion of the road between Rocklin and Truckee, which is about 100 miles in length, should be lighted for night trains. It is recommended that the section for girders for the small spans should be increased as renewals are made, and that truss bridges, as rebuilt, should be designed for heavier loads.

The Floor System for Bridges

On this road is faulty. The ties are too far apart, and are liable to be hunched and short, and generally without guard-rails to prevent a derailed truck from leaving the bridge. Among more noteworthy improvements on the subsidized portion of the road may be mentioned the new car-shops and other buildings at Ogden, Utah, and extensive yard facilities furnished at

daytime. At such points efficient distance signals should be introduced, so that in case of the misplacement of switches ample time would be had in which to stop trains. When it is remembered that during the season of snow it is practically night all of the time in the nearly 40 miles of snow galleries, and the heavy grades and sharp curves are taken into account, the importance of having efficient signals at all switches, day and night, will, I think, be appreciated." Engineer Nichols reports, however, that the Central Pacific track service is the best organized and most efficient that has come under his notice west of the Mississippi river, and compares favorably with any in the country. Auditor French says, regarding the

Southern Pacific Railroad.

The system of short vandyke ditches and culverts adopted by the company to protect its tracks from washouts caused by cloud-hursts in the region of country east of Seven Palms, in southern California, has proved very successful, but no protection has yet been found against the terrible sand-storms to which deserts are subject, nor against the drifts of sand which often hockade the track and interfere with railroad operations. Until Eastern connection is made, the main traffic will be as it has been in the past; that is, dependent upon supplies of machinery and merchandise of the numerous and thriving mining communities of southern Arizona. When Eastern connection is effected, no doubt much of the business from West to East which now passes over the Central and Southern Pacific roads, will be done by the Atchafalpa, Topeka & Santa Fe, which will have the bulk of the mileage, while the Arizona part will have

by the department, and no lands have been withdrawn north of Redding, in California, or south of Roseburg, in Oregon, a distance, probably, of 300 miles. Furthermore, the time for the completion of the roads has expired. The principal business of these roads is the transportation of wheat, flour and wood northward, but the failure of crops in Willamette valley in recent years, and consequent migration, has so reduced their business that it has been quite a difficult matter to earn enough money to keep their property in repair."

In the course of his remarks concerning the

Northern Pacific Railroad Company,

Auditor French says: "A prime necessity, both for the company and for the country through which its railroad has been located in Washington Territory and Oregon, is the immediate construction of its line eastward through the Cascade range, and westward from Ainsworth, down the valley of the Columbia on its south bank to Portland. The line to Ainsworth from Tacoma will open up the lumber country and lands for the use of wheat-growing communities centering at Walla Walla and other points, while the products of that country will find their export on the sound. No railway between the sound and Portland should be permitted to interfere with the construction of both these lines. There will be business for all, and as the company builds its road eastward, with base of supplies at Tacoma, the transportation will always be at hand, and the profit of it, if any, go into their own coffers. That any other policy was adopted, especially such a one as building east from Ainsworth and depending upon navigation of the Columbia river, with its innumerable difficulties and delays, was hardly short of being suicidal, or of placing themselves entirely under the control of a rival company."

Miners' Families and Mining Towns.

"Well I am going to leave you," said an old Comstocker yesterday, as he offered his hand to your correspondent.

"Where are you off to?"

"Down to Arizona."

"For good?"

"If I fall easy I'll stay where I'm put."

I was astonished. He was a man who had hung on to the Comstock through thick and thin since '61. He had for years been the proprietor of a popular saloon and of the leading faro and keno games. He had been an Alderman, and one of the leaders of the Republican Party. His horses have been the fastest, his turnouts the nattiest, and altogether he has been a "prominent citizen."

"Is the Comstock played out?" I asked the departing prominent citizen.

"Yes, for me. There is nothing in the saloon or the games now. The town is gone in."

"How do you account for it? There seems to be a pretty big population."

"Yes; but it ain't the right kind. You see that row of buildings (waving his hand to indicate one side of C street). Well, all them rooms upstairs used to be filled with hoys. Now the boys all have housees back here on the hill—all got wives and children, and don't appear on the turf nights no more. That's good for them, but it's bad for me. Why, if you want to know why the town's gone in, just drop around the schools when the youngsters are being let loose. In the flush old times a young one was a phenomenon here; now there's thousands of 'em. Well, all of them cubs have got to be fed, and the fellows that's got to feed 'em and cloth 'em ain't got any money to throw away. That's good for them, but it's bad for me. As a citizen I am glad of it, of course; but as a matter of business it's just ruin, and I am off for Arizona. It's a new country, and old times come again."

"You'll open a game?"

"Of course. That's what I'm after. I'll prospect around and find a camp that isn't too near the railroad, and open a saloon and give 'em a lay-out."

"Why do you want to get away from the railroad?"

"Why? Because when a town is near a railroad it soon gets filled up with dead-horses and etiffs. It's easy to get to and to get from. Men that travel by stage have got to have money, and they're the kind of men that make a camp hum in my line.—Cor. Examiner.

A MILL FOR PAHRANAGAT.—Henry Raymond returned from San Francisco a week ago and has been busy trying to secure machinery, which he has succeeded in doing, for the purpose of erecting a 5-stamp mill in Pahranaagat valley, in the vicinity of the Green Monster and other mining property owned by Harry Henderson & Co. A 5-stamp mill running in Pahranaagat will add a little life to the valley.—Pioche (Nevada) Record.

THE new well at the mill of the Bristol S. M. Co. is a success and contains sufficient water to run the mill. The insufficient supply of water for milling purposes heretofore experienced by this company has been a great detriment, but now everything will work smoothly. This company shipped a bar of hullion Wednesday valued at about \$1,800. The mines at the present time are all yielding a good quantity of fair

THE GREEN MOLD OF FRUIT, CHEESE, ETC.—*Aspergillus glaucus*.

that point, which are spacious and convenient, and the new passenger depot at Sacramento, and also the new freight depot at the same place, and the very extensive renewal of the snow gallery, necessitated by the destructive avalanches of last winter on the unsubsidized portion of the company's property and railroad. The extensive improvement in

Progress at Oakland Wharf

Is worthy of notice—solid and safe embankment of stone and gravel, brought from Alameda; some 75 ft. wide and over a mile long, increasing in width at the terminal point at the bay to 250 ft., with a length of 1,250 ft., and covering an area of about eight acres. It will afford the company permanent and probably ample room for the largely increasing business at that point, and result in great economy as compared with the present piling and wharf arrangements. Of the road (1,204 miles) 462 miles had steel tracks on June 30, 1880.

Signals at Switches.

The remarks of Government Engineer Nichols, above referred to, concerning signals at switches, are as follows: "On no portion of the company's system has the custom been introduced of lighting switches for night trains. I mention this subject not as being peculiar to this road, but in order to call attention to the special importance of both day and night signals at switches on that portion of the line between Sacramento and Truckee, particularly in snow galleries. There are points where the switch stands that are entirely obscured by sheds until the observer is within a few feet of them, so that the

but a small portion over its 200 or 250 miles. This being so, the earnings of leased lines south of Goshen, Cal., as well as those of the main line of the Central and Union Pacific, may be expected with some reason to decrease, unless new business, arising from other sources and from the natural development of the country through which they pass, make up the loss. There can be little question as to the result, the distance from St. Louis to Tucson, via New Mexico, being but 1,675 miles, while by the present roundabout line it is 3,128 miles, and the distance from Chicago to Tucson by the former route will be but 1,832 miles, as against 3,218 miles by the present overland lines.

The report makes the following statement about the

Northern Division

Of the Southern Pacific railroad.

"During the year the company has kept the property in good condition and has acquired possession of the branch road extending from Castroville to Montcrey, at which latter point on the Pacific ocean, a magnificent hotel for summer resort has been built and opened. The business of this road has remained much the same as it was in previous years, California not having, as yet, participated in the increased business activity of the country at large."

Oregon Railroads.

The Auditor says, with reference to the Oregon and California and Oregon Central railroads: "Both of the roads, the one in Oregon and one in California, are unfinished, and owing to the circuitous line proposed in the maps of

New Mexican Burros.

What would the people of New Mexico do without asses! You might as well try to make Ireland do without the pig as New Mexico without the burros. They are our beasts of burden and steady companions. If an excursion into the mountains is planned by Americans, a trip from one place to another or to market town, by the poorer classes of our natives, the gentle donkey has to carry the load. If wood is wanted in the kitchen, or for the fireplace, the burro is called into requisition. The shepherd carries his house, kitchen and store-room on the beast marked with the cross of humility. In the mountain regions the donkey has to take the place of a saddle horse, the cart, or the freight wagon. Meek in deportment, he is sure-footed on the rocky path, and after serving all day under the pack or riding saddle, at night he is turned loose to hunt his daily bread. Unsaddle him and the first thing he will do is to roll over and over on the ground to rub off the sweat; refreshed, he gets on his feet to commence the everlasting bray, and then hunts up his supper and night's lodging. The late discovery of valuable mines in our Territory has created quite a demand for asses in the market, and few, if any, can be procured for less than \$15 a head. Even parties from Leadville, the San Juan region and other mining districts in Colorado, come up to New Mexico to buy burros. Two good packers can manage from 15 to 20 donkeys to bring ore down the side of the mountains, where it would take thousands of dollars to construct a wagon road. The donkeys of New Mexico are tough, hardy and healthy animals, but like all the other native domestic animals here they have degenerated in size on account of too constant breeding in. A number of imported good jacks would almost double the price of these animals, and therefore be a great source of wealth to several of our neighbors in the Red River valley, who are known to possess large herds running loose among the hills and on the prairies.—*Red River Chronicle*

HANDSOME DONATIONS TO COLLEGES.—The following are the gifts which thus far have been made by Mrs. Valeria Stone, of Boston, from the estate left by her husband. Quite a large sum, it is understood, is yet remaining to be distributed, which will be used in accordance with the advice of gentlemen whom the lady has selected as her counselors in the disbursement of this large trust: To Bowdoin College, to finish Memorial hall, \$20,000; to Bowdoin College to endow the Professorship in Intellectual and Moral Philosophy, \$50,000; to the Halliwell class, Yale school, \$10,000; to the Fryburg Academy, Maine, \$10,000; to Dartmouth College to endow a Stone Professorship in Intellectual and Moral Philosophy, \$65,000; to Andover Theological Seminary to endow a Professorship of Relations of Christianity to Secular Science, \$50,000, on condition the subscription be raised to \$100,000; to Phillips Academy, \$100,000, to be used for the completion of the building; to Amherst College to endow a Stone Professorship of Theology, on condition of the college raising \$25,000, \$50,000; to Wellesley College to construct and furnish Stone hall, \$100,000; to the Women's Board of Missions for Harport College, Turkey, \$25,000; to the College of the Young Men's Christian Association, of Boston, to be used toward the completion of their new building, \$25,000; to Hamilton College, Clinton, N. Y., to endow a Professorship of Natural History, \$30,000; to the Chicago Theological Seminary for the Professorship of Pastoral Theology and Special Studies, \$50,000; American Missionary Association, for the institutions at Nashville, Atlanta, Talladega, Longwood and New Orleans, \$15,000; Oberlin College, Ohio, for endowments, \$50,000; Drury College, Springfield, Mo., \$50,000; Iowa College, \$22,000; Carlton College, Northfield, Minn., \$10,000. She has also given \$600,000 to her relatives and friends, and \$100,000 to churches and needy students.

THE MERCED HYDRAULIC MINE.—The *Mariposa Gazette* gives the following items of interest in regard to the works and improvements going on at the Merced river, of the Merced Hydraulic Mining Co., which, in enterprise, is at present engaging more than ordinary attention and interest. The company's works are established at a point on the Merced river, about one mile below the Benton Mills, of the Mariposa Land and Mining Co., and well-known as the "Red Bank," and consists of a complete outfit of first-class machinery. The resources for water-power are very great. At first the machinery was put in motion from a limited supply of water obtained by means of a ditch about two miles in length leading to Scott's gulch. The company is at present engaged in digging a ditch and constructing a large reservoir on Flyaway gulch, about a mile and a half from the works. This, together with the waters of Scott's gulch during the rainy season, will afford a sufficiency of water for the purposes of the company, probably six or eight months. Another permanent source of water of which the company contemplates availing themselves is the construction of a flume about two miles long, to bring the water from the Benton dam.

The hullion shipments from Silver Reef, through Wells, Fargo & Co., for the month of November, aggregated the sum of \$72,996.38.

USEFUL INFORMATION.

An Interesting Experiment.

The New York *Evening Post* gives the following details of a scheme for supplying heat for warming houses and for cooking, which is about to be tried in the district bounded by Fourth and Madison avenues and Fourteenth and Thirty-fourth streets.

From the central station the "plant," or reservoir, the mains will run through every street. One line of iron pipes, from three to six inches in diameter, placed about three ft. below the pavement, packed around with some non-conducting material and inclosed in a wooden box, will be the conducting mains from which the water will be carried by means of smaller iron pipes, one-half an inch to an inch in diameter, into the house. Auxiliary or return pipes of about the same size as the conducting mains, will be laid alongside, through which the water, after it has passed through the houses, will run back to the reservoir.

The water heated in the reservoir to from 350° to 400° Fahrenheit, will be forced out through the conducting mains and through the pipes which connect with the houses, and to each connecting pipe will be attached a water meter. The return pipe will also be provided with a water meter. Each house is to be provided with a steam converter, which in general terms is simply a small metal chamber inclosed in a large metal chamber. The water leaves the reservoir at about 400° Fahrenheit, and as soon as it enters the inner chamber it will form steam, if not confined, 212° Fahrenheit, the boiling point. The chamber is so constructed that a pressure of 10 lbs. will close a valve and shut off the supply of water. The steam will force its way through a valve into the outer chamber, whence it can be conducted through steam pipes to any part of the house and used for heating, cooking, or power, and returned through the auxiliary pipe back to the reservoir.

The steam cooking ovens are coils of pipe through which the steam passes inside of the ovens. Some of the steam will be condensed in the bottom of the converter, and can be drawn off as hot water. The steam made in the converter is of the same temperature as the water from which it came, and hence cooking which requires a heat of from 350° to 400° can be done.

There are about 12,000 houses in the district to be covered first by this system, many of the owners of which, it is said, have consented to have the pipes brought into their houses, and it is to be hoped that about 20% of the buildings in the district will be connected at the outset.

It is remarked that by using beating water less heat is lost by condensation and radiation than in the case of steam, and that the cleanliness and simplicity of the system will commend themselves. It is asserted that any head of steam can be secured, from the fact that a cubic foot of water will make 1,700 cubic ft. of steam. It is estimated that the water which returns to the reservoir will be only three or four degrees cooler than when it started out on its journey. It will be used again, and thus fuel is saved.

POURING OIL ON THE TROUBLED WATERS.—We have several times made allusion in these columns to the use of oil for softening down the violent action of the sea waves. According to the Dundee (Scotland) *Advertiser* some recent experiments were made at Peterhead, and struck the assembled Scotchmen as so successful that the proposal to lay oil on to the mouths of harbors by means of pipes, was discussed as a not very remote project. Bottles filled with oil were sunk to the bottom of the harbor in which the sea was breaking heavily. The oil was then released, and rising to the surface, it exercised an immediate and magical effect in smoothing the troubled waters. Instead of the waves breaking, the sea became quite smooth and glassy-looking, and there was a visible softening down of the waves, which, in place of being sharp and crested, were turned into long, undulating seas.

UTILIZING LEATHER SCRAPS.—A process for making huttons, heels, etc., out of powdered leather has been patented in France. The leather waste which is used, is first freed of all fatty substances by being cleansed and then immersed for an hour in a warm bath having a temperature of about 66° centigrade. Next the leather must be dried in a rotating drum located in a room having also a temperature of 66°. Then it is ground fine or coarse, as desired, after which it is cast into shapes and heated to about 120° centigrade. Then it is finished off by being subjected for 10 minutes to a pressure of from 700 to 800 lbs.

NEW APPLICATION OF MICA.—Mica has been applied to a new use—that of fashioning it into middle soles to boots and shoes. A company has been established in Cincinnati, and the new article is now being supplied to the boot and shoe trade. The invention consists of a sheet of mica imbedded in thin coatings of cement and placed in the hoot or shoe under and adjacent to the insole, the upper leather of the shoe lapping over its edges, or next under the filling, or between the filling and the outer or bottom sole, and covering the upper space from the toe to the instep.

Grape Seed Oil.

We recently made some allusion to an oil obtained from grape seeds as something quite new. But a correspondent of the *Scientific American*, from which journal we gleaned the information, writes that the "alleged discovery" has been known for more than a century. As early as 1770 oil was made from grapo seeds in Italy and France. In 1800 there was a factory at Olhy which had existed from time immemorial. Other factories existed in Bergamo, Italy, in 1770; in Rome and in the vicinity of Ancona before 1782; Naples, 1818; Germany, before 1787.

"In the south of France, where the grape-oil industry is carried on, from 10 % to 15 % of oil is obtained, the oil being better and sweeter than nut oil, and remaining fluid at a lower temperature. It is used in lamps, and gives a bright light, without odor or smoke.

"In extracting the oil from the grape kernels, the refuse left after distilling brandy or making verdigris is dried and ground fine in an ordinary mill, the yield of oil being in direct proportion to the fineness of the grinding.

"Some manufacturers first press without heat, obtaining about five per cent. of oil, afterwards the stuff is heated and pressed with a yield of 10 % or 15 % more oil. The oil is of a light yellow color, and in course of time obtains a density of 0.9202 at 59° Fah., and solidifies at about 3° Fah. M. Laliman erre in recommending this oil for watches, for although it does not congeal as soon as other oils it becomes viscid and rancid when exposed to air. Grape oil saponifies readily, but the soap lacks hardness and density.

"Black grapes contain much more oil than white grapes. The kernels of grapes from vines in full vigor yield more oil than those from very young or very old vines. In France the vines of Roussillon, Aude, and Hérault give the most oil. In general black grapes produce from 15 % to 18 % of oil; white grapes, 10 % to 14 %.

"It is probable that American vines, especially those of California, yield more oil than French vines. In the south of France 25 lbs. of kernels are allowed for 25 gallons of wine. It is easy to estimate the quantity of oil that is annually lost in grape producing countries."

May it not be that there is here a hint for a new and profitable branch of industry that might be successfully introduced into this State?

ENGRAVING HARD METALS.—A French engraver has discovered that the engraving tool will cut into metals which were impenetrable, if the tool is occasionally dipped into petroleum. The hardest steel may be incised easily, if the engraving tool is dipped into a solution of two parts petroleum with one part of terebintine. This may be a new discovery in France, but on this side of the channel a precisely similar process has been practiced for some years.—*Design and Work.*

GOOD HEALTH.

What is a Cold Bath?

The season of the year when very many people who have experienced pleasure and advantage from a daily cold bath have to discontinue the practice, is come. Months will elapse before the return of genial weather will allow of their indulgence in what may be termed man's natural stimulant. Among the young and robust there are a large number who are able to bathe even in the depths of winter; the advantage of so doing is, however, questionable. But let it be once well understood what a cold bath really is, and the course by which we can avoid Scylla and Charybdis will be obvious. A cold bath is not necessarily a bath in water of the temperature of the atmosphere. A bath is truly and really cold when it produces a certain physiological effect—a slight, momentary shock, followed by pleasant and lasting reaction. These effects are for the majority of people most pleasantly obtained by bathing in water about 35° to 40° below the temperature of the body—the usual temperature of unheated water in June and July. Bearing this in mind we can enjoy our physiological "cold" bath as safely and pleasantly at Christmas as at midsummer, and there is no necessity for the most timid or weakly to discontinue his morning tub because the summer weather is over. When the water sinks below a temperature of 60°, let it be heated to that point and then used, and we shall still have our "cold" bath, though of heated water. The daily stimulant effect of such a bath is so beneficial to the great majority of persons and is of such marked service in maintaining health, that it is very important to have it widely known that a cold bath may be taken all the year round, provided cold is not mistaken to mean "at the temperature of the outer air." To bathe our bath during the winter months is too often thought to be unmanly, while in reality it is truly scientific, and to bathe in unheated water all the year round, whatever the temperature that water may be, is to prove one's self an ignorant slave of outward circumstances.—*Lancet.*

Holiday Dinners.

Good Health says: "Friends, these of you who expect to treat your children and relatives or neighbors to a holiday feast, let us give you a hint. Before making preparations for the occasion pause a moment to consider whether it would not be best to deviate a little from the almost universal custom of making our national holidays the occasion for animal gormandizing. Instead of loading the table with articles of food of a character certain to injure the digestive organs, and to work mischief in every part of the vital organism, would it not be better to put upon the table a variety of good, wholesome foods which might be partaken of with impunity, and which will not stimulate the palate to gluttony?"

"Overeating at Thanksgiving, Christmas and New Year's dinners annually causes many cases of sickness and not a few deaths. Doctors are always busy the next day after these holidays, and many generally expect an unusual increase in business.

"Nothing could be more unreasonable than for people who understand the laws of health as relating to diet, to depart on special occasions from the course which their reason leads them to generally pursue, and by their actions, at least, declare to be good and desirable at those special times what at all other times and on all other occasions they pronounce bad and unwholesome."

This is sound advice. Why are all our holidays, days of unreasonable, unnatural feasting? Our women might make a great reform in the world in this respect.

BENEFIT OF LAUGHING.—Dr. Greene, in his "Problem of Health," says there is not the remotest corner or little inlet of the minute blood vessels of the human body that does not feel some wavelet from the convulsion occasioned by good, hearty laughter. The life principle, or the central man, is shaken to its innermost depths, sending new tides of life and strength to the surface, thus materially tending to insure good health to the persons who indulge therein. The blood moves more rapidly, and conveys a different impression to all the organs of the body, as it visits them on that particular mystic journey when the man is laughing, from what it does at other times. For this reason every good, hearty laugh in which a person indulges tends to lengthen his life, conveying as it does, new and distinct stimulus to the vital forces. Doubtless the time will come when physicians, conceding more importance than they now do to influence of the mind upon the vital forces of the body, will make their prescription more with reference to the mind, and less to drugs for the body; and will, in so doing, find the best and most effective method of producing the required effects upon the patient.

SLEEP.—By far the best sleep is obtained at night—nature's chosen period—at a time when all is hushed and favorable to the best repose. The fowls early seek rest, as the sun sinks, and then set us the good example of early rising, with joyous song. Beside the repose and rest of the body, important and absolutely needful changes are effected in the system, while observation and experience prove that sleep obtained by day can never equal that at night. The young, in all of their vivacity and activity, need more sleep, and relatively more food than adults, and females need far more than males, especially mothers. Their labors, toils, cares, anxieties, watchings over their children, their whole round of duties necessarily tax and depress the nervous system, absolutely demanding much sleep—far more than many secure. Of these, those known as the "nervous"—with diseased nerves, exhausted—need the most—all they can secure. Sleep, on an empty stomach, is the best "nervine" for each.

HOW PEOPLE GET SICK.—Eating too much and too fast; swallowing imperfectly masticated food; trying too much fluid at meals; drinking poisonous whisky and other intoxicating drinks; repeatedly using poison as medicines; keeping late hours at night, and sleeping late in the morning; wearing clothing too tight; wearing thin shoes; neglecting to wash the body sufficiently to keep the pores open; exchanging the warm clothes worn in a warm room during the day for costumes and exposure incident to evening parties; compressing the stomach to gratify a vain and foolish passion for dress; keeping up constant excitement; fretting the mind with borrowed troubles; swallowing quack nostrums for every imaginary ill; taking meals at irregular intervals, etc.

HOW TO KILL A TAPEWORM IN AN HOUR.—Dr. Karl Bettelheim, of Vienna, narrates, in the *Deutsches Archiv*, a heroic method and nearly sure cure in the short time of three quarters of an hour to two hours. It is this: He inserts a tube in the esophagus, to the stomach, and pours down from 200 to 400 grams of a very concentrated decoction of pomegranate root, having previously had his patient fast for 24 hours. The worm is stupefied, and passed, head and all, to a certainty; the patient has no sickness of the stomach, and no nauseous swallowing to do.—*Medical and Surgical Reporter.*

It is believed that fat pork produces sorofula, but we do not think that other fats produce it. Indeed, fat in some forms is essential to health.—*Dr. Holbrook.*

The Week.

Of course the event of the past week has been the splendid rain storm which poured its torrents down to rejoice the heart of the hydraulic miner. This heavy rain brings with it work for both miner and farmer. The last shower previous to this was not enough for the miners. In most places the ground was so dry that the water was mainly absorbed, and as a consequence the flow in the ditches did not amount to much for practical purposes. The ground having been softened, however, the late rain must have set things humming in many places.

A great deal that is of interest to us on this coast is just now under way. The isthmus canal schemes, the various railway projects, the new mining territory of New Mexico, northern Mexico, are all topics of interest to be discussed. Each week we glean from the floating chaff all that is of interest to our readers and present it in as condensed form as possible.

And while writing of this week, we may speak of next week. We intend to present a double-sheet edition fully illustrated, with original engravings, and replete with information of interest and value to the miners, mechanics and other industrial classes of the coast. We are endeavoring continually to improve the PRESS, and next week's issue will be but an example of our efforts.

In a card to the stockholders of the South Bodie mining company, the Board of Trustees explain that the recent assessment of 25c per share was levied to provide funds for the purpose of protecting the valuable works of the

Tailings.

It is only of late that any particular attention has been turned toward the working of tailings from hydraulic mines. It is true that for a number of years it has been supposed that the tailings in many localities would pay to work, but no active steps have been taken to take the matter in hand. A number of projects have been offered to the public, and while there has been more or less talk, there has been no means a proportionate amount of work.

There are numerous localities in California where there are enormous accumulations of tailings from hydraulic mines. It by no means follows, however, that in all of these places can the deposits be worked. It requires an abundance of water, a certain amount of fall, and favorable conditions generally to be able to work such deposits with any degree of success. It by no means follows that because a man has an immense deposit of tailings, he can therefore make money out of them by turning on a stream of water and letting it run. This appears to be the idea of a good many people, and several schemes have been started on this basis.

It must be recollected that in working the original ground by hydraulic, the mines are not always profitable. In fact, there are as many, if not more, chances to be taken in hydraulic mines as in quartz. There are many things to be taken into consideration, and a change in any one of the conditions may cause a loss.

The beds of tailings must be in a position to be readily accessible. There must be plenty of water, plenty of fall, a good chance for dump, and above all, good tailings. The value of tailings is often very much exaggerated, as unfortunate experience has proven in many instances. In figuring up profit, the average value of the whole mess must be considered, as it must all be moved, just the same as the valueless top dirt of the hydraulic banks must be moved.

Just now considerable attention is being paid to tailings. Several Eastern capitalists have become interested, and have taken up propositions to work the deposits in certain districts. It is said also that a number of our well-known San Francisco mining men are quietly at work getting possession of deposits known to be valuable. They may be doing this to sell to the Eastern people, or to others, after the fashion of our capitalists, who generally prefer to let others take the chances of the working operations, unless they can see \$2 in sight for every \$1 put in. However that may be, they are getting hold of the ground.

Among prominent enterprises in this connection now talked of, is the much advertised "Big Bend," on the North Fork of the Feather, 10 miles above Oroville. It is estimated that they will get out \$150,000,000, by cutting an 11,600-ft. tunnel to drain 13 miles of the Horseshoe bend, the whole to cost about \$1,000,000. Eastern people are said to have taken hold of this speculation, but of course no one expects any such Alladin-like results as those set forth. The gravel is from 30 to 50 ft. deep.

The Bear River North Fork Tunnel project is another enterprise long talked of, but which only of late has taken shape. This is a project of running a tunnel through the divide between the North Fork and Bear River, at a point near Cape Horn, for the purpose of affording drainage and fall for working out the accumulations that have gathered in the bed of Bear River from the mine above. The Placer Herald announces that this enterprise has been taken hold of by capitalists who are determined to put it through. From the point where this contemplated tunnel will tap Bear River, up the stream for quite a number of miles to opposite Dutch Flat, on the Placer side, and Little York on the Nevada side, the bed of Bear River is filled from 50 to 150 ft. with tailings from the hydraulic mines, which cannot be washed out for want of fall and dump room. The proposed tunnel is to supply this want. Its construction is a big undertaking and big results are of course expected.

Another project is to hydraulic the tailings in the canyon below Dutch Flat, known as Dutch Flat canyon, where they have been collecting some 20 years. Arrangements are being made by the Cedar Creek ditch company. The *Forum* says this company owns most of the ground on which tailings have accumulated, but will wash over some ground belonging to other parties, they having obtained the right to do so from the owners. A good-sized pipe is being laid over the hill up to near the Dutch Flat station, where it will be supplied with water from the main ditch, and another pipe will be laid from the other, or town side of the canyon. A good head of water will be turned into the canyon as soon as the rains bring enough in the ditches and everything is ready for work.

In all of these enterprises, in which stock is to be held, it is just as well before purchasing for people to inquire pretty closely into the details of the scheme. It is also as well for them to inquire into the professional knowledge of the persons who report on such properties. When such men as A. J. Bowie, Jr., J. D. Hague, Hamilton Smith, Jr., or Joseph McGilvray, prepare a report, we know that their practical experience will have led them to study the project in all its bearings. But it is not every one who is posted on hydraulic mining. Because a man signs himself "M. E.," it by no means follows that his title is clear, or that his

Assays and Mill Returns.

We read in an Arizona paper that a certain mine has on its dump ore that will average \$500 per ton. And also that a lot of 15 tons was carefully sampled by the men who took it out on contract, and found to assay \$900 per ton. But after being run through the mill it did not pay expenses.

This statement will sound curious to those not familiar with mining matters. One man will say that this mill man was a thief. In fact mill men are pretty often called thieves—very often, no doubt, when the fault lies with the miner. Another will say the assayer made a mistake; and yet another that the sampling was not properly done.

The truth of the matter is, as all miners know very well, that assays and mill results differ very materially. People hating mines, don't often hush them on the strength of assays. And people judging of the value of a mine do not base their judgment on assay value of ore alone.

That is they do not do so if they know anything about mining. Assays can, of course, only show results of the particular pieces of rock tested. It is not the fault of the assay if the piece is not an average sample. If a lot of rock is properly sampled, and the assays carefully made, close calculations can be made of its value. But a very great deal depends on the sampling. Sampling is an art in itself. No miner can go on to a dump and pick up a sack of ore and get a fair average. He will unconsciously pick up the best pieces. Some people in getting ore from a dump for sample go so far as to blindfold themselves and they can pick up the ore then without deceiving themselves.

But when comparing assays of stray pieces of ore with mill returns on a lot of the ore from the same mine or dump, it invariably happens that the mill comes out way behind. But the mill ought not always be blamed for this. People in new countries like Arizona and New Mexico are apt to get a good many assays of pieces of ore assaying up into the thousands. But we never hear of any ten or twenty tons milling up into the thousands. If the miners have their profits or values computed from assays they will find themselves very much mistaken.

Men will have assays made of ore which will return, say, \$1,000 per ton. Then they will get out, say, 50 tons of ore, and delude themselves into the belief that this ore is worth almost its assay value. It will be noticed, however, that most of such "mines" will be sold for \$10,000 or \$20,000, even including the 50 tons of \$1,000 ore.

The fact is that this \$1,000 ore is so very exceptional that no sensible man looking for mines ever takes into account the probability of finding any such deposit. Such ore exists in assays but not in mill returns. Whenever we hear of ore assaying \$1,000, \$2,000 and \$3,000, we know the man who selected the ore for assay, did select it, and that is no criterion at all to judge of the value of the ledge in which it was found.

It is generally when camps are first started that such ore is found. We never hear of \$1,000 ore in any old camp with well-developed mines. The mill work takes all the nonsense out of the business. Camps without mills can blow about such rock, but when a mill gets at work on it the poetry of "glittering ore" is displaced by the prose of dollars and cents. The combination of stamps and quicksilver give us the truth about the real value of the rock, and it is on them we must depend for results.

ARCTIC RESEARCH.—The Royal Geographical Society has, after mature deliberation, decided to send out another Arctic expedition next year. It is probable that the route by Franz Josef Land, familiar to readers of the narrative of the Austrian expedition under Weysprecht and Payer, will be adopted rather than that so oft essayed by Smith's Sound. The chief aim of the British expedition of 1881 will be to explore the area north of the 79th and 80th degrees of north latitude. It is certain that the discovery of the north pole is not to be its main object.

An ingenious plan has been devised by the engineer in charge of the projected Market street cable road, for working on the road without interfering with the traffic. A number of bridges in sections of 100 ft. each are being built, and these will be placed over the track while the work is going on underneath. Extensive excavations are being made at the junction of Market and Valencia streets for the engine and car-house.

ANOTHER COLLIERY DISASTER.—Dispatches from Cardiff, on the 10th, gave the news that a great explosion had occurred at Pen y Graig, a new colliery in the Rhonda Valley. The pit is about one mile from the great explosion in the Dinas colliery, in the same valley, January 13, 1878, when about 60 persons lost their lives. This time 87 persons were killed. The shock was felt for miles around.

CHARLES SCHUYLER was killed on the South Fork of Scott river, above Callahan's, last Saturday morning. The tunnel was about 30 ft. under ground and citizens hurried to the rescue, but did not get his body for a few days. He

Manufacturing Towns.

In a recent article we urged the necessity of establishing manufacturing enterprises in the interior towns of California. We have all begun to recognize the fact that California business interests will languish without more home manufactories. With all our producing capacity we do not produce enough. Our raw materials are sold and sent away, but we buy back some of them in this shape of manufactured products. These manufactured products can be made here as well as abroad, but the difficulty is to enlist the services of capital in starting up the proper sort of factories.

And, while we naturally want to see San Francisco grow, we want still more to see California grow. We want to see a number of flourishing manufacturing towns. When these are established the metropolis will be benefited also.

"The population of Massachusetts does not greatly exceed that of Georgia; but in the former State there are 31 cities, each containing more than 10,000 inhabitants, while in Georgia there are only five such towns. This shows what manufactures do toward the building up of towns; and a good supply of towns always makes the farmers laugh, because they afford good markets near at hand."

So says the *Atlanta Constitution*, and very correctly, too. We are just as badly off as Georgia is, as regards large towns. We have only five towns with over 10,000 inhabitants, outside of San Francisco, viz: Los Angeles, Oakland, Sacramento, San Jose and Stockton. Of the towns with over 5,000 and less than 10,000, we may count Bodie, with 7,000 inhabitants; Marysville, 7,000; Santa Rosa, 5,000; Petaluma, 5,000, and Vallejo, 6,000. Of those towns with less than 5,000, but over 3,000, we may count Alameda, 3,000; Chico, 4,000; Colusa, 3,000; Eureka, 4,000; Merced, 3,000; Grase Valley, 4,000; Nevada City, 3,500; Red Bluff, 3,500; San Bernardino, 3,000; Napa, 4,000; San Diego, 3,000; Santa Ana, 3,000; Watsonville, 4,000; Woodland, 4,000. Those with less than 3,000, but over 2,000, are Anaheim, 2,000; Gilroy, 2,500; Healdsburg, 2,500; Hollister, 2,500; Monterey, 2,000; Selinas, 2,500; San Luis Obispo, 2,500; Sonoma, 2,200; Truckee, 2,000; Yreka, 2,000. Those with over 1,000, but less than 2,000, are Antioch, 1,200; Benicia, 1,700; Dutch Flat, 1,500; Folsom, 1,500; Fresno, 1,200; Martinez, 1,500; Riverside, 1,200; St. Helena, 1,300; San Andreas, 1,200; San Rafael, 1,500; Sutter Creek, 1,200; Ukiah, 1,500.

These figures of population we compile from the Pacific Coast Directory for 1880-81, and they may not be exactly correct, in view of the more complete census returns. Nevertheless, they afford sufficient basis for the object of comparison.

We have not in all California one single town devoted exclusively to the manufacture of certain articles. None of our towns are noted for the manufacture of special articles. In fact, we have not got any manufacturing towns. All the places we have mentioned, with local manufactures, could be able to support double and treble their present population. If local capitalists would take the matter in hand, and see what they could do in the premises, they would do the best thing possible for their towns. Certain things could be made more advantageously in one place than another, and the work would be thus divided up.

Certain it is that to establish and maintain prosperous communities in this State, we must manufacture more than we do, and this ought to be done in interior towns. We must lend all our energies to awaken the dormant mechanical skill, arouse the listless capital, and engage the attention of the people in different localities; and above all, we must do something to push the matter on. The subject must not be allowed to rest, but it must be agitated until active steps are taken to accomplish something in the right direction.

THE machinery for a 30-stamp quartz mill, for the State Line Mining Co., in Esmeralda county, is now being taken east by rail to Battle Mountain; thence, by rail to Austin; from which place it will be taken by teams to its destination. It looks somewhat strange to see machinery for southwestern Nevada going east over the Central Pacific railroad, but it appears that it is the easiest and cheapest way to get it to its destination.

TOWN-SITE APPLICATIONS.—Senator Booth has, by request, introduced a bill providing that in all cases of conflict between town-site applications and mining claims, whether lode or placer, the exclusive right to the patent for the land in conflict shall be determined by priority of claim, provided the same is otherwise in accordance with the law.

LIEUT.-GOV. WESTON has given instructions to Manager Gardiner, of the Troy and Greenfield road, to try the experiment of illuminating the Hoosec Tunnel by electricity, with a view of having each illumination permanent, should it prove successful.

PROF. GEORGE DAVIDSON, President of the California Academy of Sciences, has returned from the mountains, where he has been during

Mining Law Amendments.

Already Congress has begun to tinker with the mining laws. It seems as if, of late, as soon as Congress convenes the mining laws come under consideration; and the more they amend them, the more they complicate them. The simpler the mining code of the country, the better for all concerned—except the lawyers. If the laws are amended, altered and fixed over and over again, a lawyer's services are required to interpret them.

This ought not to be so. The mining laws should be so simple that any miner could construe them without doubt. The way some of the amendments have been put through has been very careless. The wording has been such that it was liable to two or three constructions, involving a great deal of misunderstanding and confusion. Most of the members of Congress from this coast have not been men who knew much about mining matters, and those who did, never manifested any great desire to thoroughly sift out the needs of the mining community.

It is probable that now, since so many Eastern people have gone into mining, some of them will come out as experts in this line and show their wisdom in drafting laws for the miners. The attempt made at the last session, however, were not very successful. Making laws applicable to only one district, but designed to cover all, was not exactly the thing for a first attempt.

The law of May 10, 1872, was and is a very good one. It has now become pretty well understood by the miners, and the fewer changes we have, the better will the miners like it. The proposed change to which we refer is a bill introduced this week by Senator Teller, which provides that any person owning six or any less number of mineral lode, ledge or "blanket" claims adjacent to each other, or not more than half a mile apart, on which the assessment labor for the first year has been performed, may thereafter perform upon any one claim of the combined number, the entire assessment labor due upon the whole number of claims. If pay mineral is reached on the claims worked, it shall then cease to be counted as one of the combination, and another shall be selected on which to work the assessment of the remainder, and so on, until pay mineral is reached, or all the ground abandoned. The bill also provides that mining claims located since the 10th of May, 1872, whether located by one or more persons, shall not exceed 1,500 ft. in length along the vein or lode; and that no claim shall extend more than 300 ft. on each side of the middle of the lode or location at the surface.

We reserve comments on this proposed measure for a future occasion. Meantime we would be pleased to hear mining men give their views on the matter, for it is only by a fair discussion of the merits of such amendments to the mining laws that anything of lasting benefit can be had. In a multitude of counsel there is wisdom.

The Economist Planer and Matcher.

The accompanying illustration represents one of Frank & Co.'s light planer and matchers. There has been a call among smaller shops of interior towns for a machine at a low price, that would answer the purpose of both surfacer and rustie or flooring machine. This machine not only does that work, but is also adapted for making light mouldings.

This machine has been built with a view of making it as cheap as possible, and yet to do good work. Has a heading attachment and will stick rustic and light mouldings. The cutter-head is stationary—the box being cast on the frame. The bed lowers from the head. The matcher spindle is attached to arms cast on to bed, and raise and lower with it. The spindles are easily lowered for surfacing. The machine has a good and reliable feed. Two sizes are built, to plane 20 and 24 inches, and to match 13 and 18 inches, respectively.

These machines are sold about as cheap as an ordinary small surface-planer. The Berry & Place Machinery Company have them on hand at their store, 323 Market street, and will be pleased to furnish price or any other information desired.

THE Catalpa mine, which adjoins the Evening Star mine at Leadville, Colorado, has declared its first dividend of 20 cents per share, aggregating \$60,000, payable at New York on the 15th inst. It is expected that \$40,000 will be carried over after deducting enough to pay the dividend.

STATISTICS of 64 railroads gathered by the Chicago Railway Age, show that they have already added 335 locomotives and 24,175 cars to their equipment this year, and the Age estimates that all the roads have required 1,595 new locomotives and 68,420 cars worth \$65,679,920 altogether, besides laying \$71,146,000 worth of new ties and rails.

Work Your Own Claim.

We recently took occasion to note the results of work of a number of miners in this State, who had returned to an almost abandoned district, taken up their picks and shovels, and worked out its and their own salvation. They gave up waiting for capital, and went in to make something for themselves. And they did it, and are doing it still.

The example, though by no means isolated, is not so general as it might be. We would like to see more of just such occurrences. Miners are too apt to tarry round the big camp, expecting to be lifted on a "boom." After working for big companies, they seem to hesitate about going in for themselves, as if they were afraid of dropping back a peg. Some of them are probably like the fellow the Nevada Transcript told about the other day, who worked in a mine for two dollars and a half a day. He came to town the other night, got drunk and was sentenced to pay a fine of \$20 or to go to jail for five days. When his term was out he was so stuck up because the judge had allowed him four dollars a day, that he would not go to work in the mine again at the old price.

But really, there are many districts in California and elsewhere, which would afford a good living to miners if they would pitch in for themselves and not look for too big things. It is by no means the very rich rock that pays. Thousand dollar rock is only seen in cabinets and assay offices. It is never seen in mines. Nobody ever hears of it in mills, though there is plenty in newspapers, especially those in new districts. Ordinary rock worth from \$15 to \$30 a ton will pay well according to the locality. Of course, most of our rock in this State will not run as high as that.

Another example of what prospectors can get when they work at their claims, is shown in the

THE ECONOMIST PLANER AND MATCHER.

mill returns of the Pugh mill at Ophir, in Placer county. The Placer Herald obtained from the mill owners a report of the rock crushed during the current year, which shows a very high average. The Herald says: "This mill runs entirely on custom ore, and consequently its crushings include rock from nearly every ledge, not provided with works of its own, in this part of the country. Among the many, of course, the yield of some is low, but from the average we get an idea of how well prospecting pays in this section of the country. During the year just closed there was crushed at this mill 1,774 tons of ore, and the yield from that many tons was 2,230 3/4 oz. and 4 1/2 pwt. Rating this gold at \$14 50 per oz., which is a low average, the yield from the above amount of rock is worth in round numbers \$32,335, or \$18.25 per ton. This is the report only of one mill, but it is fair to presume the return of rock crushed at other mills would not reduce the average. When prospectors realize \$18.25 per ton from all the rock taken out in the course of the year, it can readily be seen that prospecting is not a bad business. Few districts in the State, however, we believe, can make as good a showing."

THE PATRONS OF THE PRESS.—An agent of the PRESS who is now in the field and thus forming the personal acquaintance of our circle of readers, writes as follows in a private letter to our publishers: "It has been my province to have had considerable to do with journalism and the business department thereof in the East, and I take occasion to state that a more desirable class of subscribers and patrons of journalism I have never met with than those I find on your list." We believe our agent is right. Our own experience approves his conclusion.

THE TEACUP MILL.—The Teacup Co., at Cherry Creek, has let the contract to build a 10-stamp mill to reduce the ore at that mine. The contractors are under bonds to complete the work by January 1st. When the mill is completed ore crushing will commence immediately, the company having enough on the dump to keep the mill running for some time.

It is estimated that 25,000 colonists have entered Indian Territory.

Reduction Works for Low Grade Ores.

The means of profitably working low grade ores is the problem which mining men are daily meeting. Of course, so much depends on the class of ore that no general answer can be given to the question, nor is it expected. But the difficulty is to get a satisfactory solution in the case of any low-grade ores. Then again, what are low-grade ores in one locality are not considered so in another. In some places where fuel is scarce, transportation difficult, labor high and living expensive ore could not be worked profitably, which would, in other places, where more favorable conditions existed, be considered first-class ores. In California our main problem is the economical working of low-grade gold ores, but more particularly sulphureted ores. In Nevada, our nearest neighbor, they have long been wrestling with the question of how to utilize their "robbilious" ores, particularly those on the Comstock and vicinity. There are a number of mines in Florsy district that show large lodes of argentiferous galena. There are good smelting ores west of Silver City, alongside the Virginia & Truckee R. R. Carson City is the center of an extended section from which low-grade ores can be shipped, and a great deal of talk has of late been made about putting up smelting works there. A committee of citizens was appointed to consider the advisability of erecting a first-class smelting furnace. They invited all owners of rebellious ores to forward samples of 200 lbs. each of the varieties of ore in their mines, together with a statement of the amount of each kind their mines were likely to furnish. Several meetings of the citizens' committee have been held. G. W. Jones, mining engineer and metallurgist, at present in the employ of the Isabella mining company, was before the committee, says the Appeal, and gave valuable and full information as to the cost of smelting lead ores and concentrating and leach-

Customs of the Comstock.

The hearing of the case of Burks vs. Flood, et. al., is going on in Department No. 2, of the Superior Court, in this city. During the progress of the trial many interesting little facts crop out, which, though well understood and known by those familiar with mining practices here, are not so well understood by the general public. William Stewart, formerly United States Senator from Nevada, testifies that in the early days of the Comstock lode, owners dealt in feet—so many feet of a mining claim, instead of so many shares, but subsequently the dealings in feet and conveyances accumulated to such an extent that owners of claims were induced to incorporate and turn their feet into shares; stock was issued at once where titles were clear; when doubtful, they were investigated, and as soon as cleared up, the stock was issued; a large business grew up in investigating titles, and the searches and investigations in some cases—for instance the Yellow Jacket mine—filled several large volumes.

Solomon Haydenfeldt, legal adviser of the Consolidated Virginia Mining Co., at the time of the transactions complained of, and occupying the same capacity now, testifies this week that it was not the custom on the Comstock to pay money for mining ground, for the reason that money for carrying on the work was at the time of these transactions generally raised by assessment, and any money paid out for ground would to that extent diminish the fund available for working the mine; it was desired to get the stock out so as to make it assessable and increase the working capital or funds; at the time of the purchase of the Kinney ground there were serious hazards about such purchases; there was no certainty of profit; the sales of stock in the stock board here were not very reliable indications of the actual value of mining ground; in the case of well developed mines, which have paid steadily for a long time, the board sales may be a fair criterion, but with new mines the fluctuations are no guide to the value of mining ground; these values were merely speculative; there were tricks and devices by which to elevate and depress the price of stocks. Stock in the Con. Virginia Co. was always issued to holders of interests in the 1,160 ft. comprised in that mining claim; the deed of the Kinney ground to witness expressed a consideration of \$1,200; there was no concealment of the fact that Flood was the purchaser of the ground, and Flood offered at the next ensuing meeting of the Directors, to convey the ground for the stock; there was no concealment in respect of the purchase of any of the interests referred to in the complaint. On cross-examination, witness stated that there was no general meeting of stockholders in the Con. Virginia Co. in 1872, subsequent to the purchase of the Kinney ground; at the annual meeting of stockholders in January, 1873, there was no reference to the purchases of these titles, nor to the issuance of stock for them, nor was anything said about them at any subsequent annual meeting; there was nothing on the books to show what Flood paid for outstanding claims, for such a statement would have no business there; these matters were well known to the Trustees and Secretary, and were talked about as a matter of general knowledge.

Mr. Haydenfeldt has probably as much knowledge of mining transactions as any man on this coast. His statement with relation to the value of stock and value of the mine itself should be remembered. The facts are as much facts now as then. The quoted value of the stock by no means gives any idea of the value of the mine. A good many of our best mines never have any stock quoted, while a great many of the poor ones have their stock continually quoted. As matters are nowadays with the Comstock without bonanzas and the stock market without buyers, the customs of stock sharps and mining sharps are not of so much importance as formerly, but still a record of their proceedings will serve as experience for others.

COPPER SMELTING.—The Lyon County Times says: "There is a likelihood that at least one man who has stood by his mine for many years, and despite many discouraging circumstances, is about to be rewarded for his perseverance. John Ludwig, the owner of the Ludwig & Carter copper mine, in the Walker River country, has succeeded in inducing capitalists to assist him in developing the property. He is erecting a furnace at his mine, and if the ore proves to be good for smelting he will keep the furnace running steadily, as he has between 3,000 and 4,000 tons of ore on the dump and quite as much more in the mine. The Ludwig (or Ludwig & Carter) mine has been worked for a number of years, and although none but the best of ore—that carrying at least 15 units of copper to the ton—could be freighted to Dayton and sold at a profit, yet the mine has always been self-sustaining. If the furnace now being erected works satisfactorily many others will doubtless soon be erected in the vicinity, as there are several good copper mines there, the ore of which, while it will not pay for mining, sorting, hauling and reducing in Dayton, would pay handsomely if worked on the spot."

ing base ores. The entire cost of such works was estimated to reach \$30,000; an additional reserve fund for the purchase of ore, etc., to keep the works running, and it is estimated that this fund should be \$30,000 to \$50,000. These works would reduce from 30 to 40 tons of ore per 24 hours, and would save gold, silver, copper and lead. A meeting of the committee was held last Saturday evening, and the following resolutions were passed:

WHEREAS, The rebellious ores of Nevada require scientific and practical experience and appropriate process to make them yield their value, and

WHEREAS, Such ores, if properly and scientifically treated, would secure to the State a prosperous future, and yield to the commerce of the world the large wealth contained therein, therefore,

Resolved, That reduction works, known as the Nevada Reduction Works, be erected.

Resolved, That their location and place of business be at Carson City, Nevada.

Resolved, That stock be issued to the amount of 100,000 shares, at the par value of \$1 per share for the purpose of securing and supplying the necessary funds to defray the expenses of constructing such works and as a reserve fund to purchase ores and supplies.

Resolved, That books be at once opened for subscriptions for stock, and that subscribers for stock be required to deposit 5% of their subscriptions, so that any part thereof may be used for the purpose of defraying the expense of preliminary investigations.

Resolved, That Messrs. Bryant & Bence be a committee to furnish such books and the necessary documents belonging thereto.

Resolved, That the bank of Wells, Fargo & Co., of Carson City, be elected Treasurer of the Nevada Reduction Works.

THE EXPLOSIONS in the Stellarton mine, Halifax, continue. No lives were lost. The shaft got on fire, and the latest explosions, on the 14th, destroyed all hope of opening the mines and resuming work. The miners are gloomy and disconsolate.

THE Ventura Free Press says: The well of the Los Angeles Oil Co., at the Sepe is yielding 50 barrels per day of fine green oil. The company intend to put down several more wells in the spring.

The Effects of Patents on Capital and Labor.

In the Economy and Trade Department a paper was read by Mr. John Standfield, of London, on "The Effects of Patents on Science, Capital, and Labor." The writer asserts that the three things which most require protection were science, capital, and labor. It was evidently our interest, he submitted, to afford inventors all the scope we possibly could, so that our trade and income might increase and our expenditure diminish. Contending that we had legislated so badly with regard to the development of science, and the value of both capital and labor had been kept considerably below what it would otherwise have been, he remarked that the prosperity of a nation depended upon its scientific progress—using these words in a wide sense to embrace all discoveries and improvements in our numerous and varied industries—that scientific progress, in its turn, depended upon invention, and that the inventions of a nation were practically dependent upon its patent law. This was, perhaps, more particularly the case in this country than in any other. In the United States, a patent was granted for 17 years, after careful examination by experts, for the small sum of £7; whereas a patent in this country was hurried with the heavy stamp duties of £175 and was not subject to any examination. This enormous difference handicapped the British inventor by 25 to one in favor of the American, and thus, taking the average of the last 10 years, there were 13,356 patents granted to the United States against 3,039 in this country. Mr. Standfield accordingly proposed that our stamp duties should be so reduced that a patent in this country could be obtained as cheaply as in America. His proposal was to charge a stamp duty of £2 on application of a patent, and a further duty of £3 when the patent is granted, and an annual stamp duty of £1, £2, or even £3, so that the Patent Office may be more than self-supporting. He also proposed that patents should last 21 years, including provisional protection for one year. Mr. E. J. Waterson also condemned the present state of the English patent law, and urged the necessity of appointing a Minister of Commerce. Mr. R. A. Macfie opposed licence only for patents, on the ground that it granted a monopoly. Prof. Heinemann said he was opposed to the abolition of patent duty, as it would discourage invention. Mr. Westgarth (London), thought the patent duties were the greatest possible stimulus to invention. Mr. Rendall (Leith) remarked that this was a country of monopolies, as was proved by the existing patent laws.

THE DEBRIS DAMS.—The people in the mountain ains above and in the valleys below the debris dams on the Yuba and Bear rivers are feeling a good deal of interest as to how far these works will subserve the purpose of their construction now that the storms of winter are about putting their strength and capacity to a test. It was fortunate that the dry season was so prolonged, as it enabled the contractors to hring their work to completion before any rains came to add to the volume of water in the streams; and equally as fortunate was the fact that the late storm, although very severe, came principally in the form of snow in the mountains, and prevented an extraordinary rush of water to the rivers, so that the dams were not put to the ordeal of resisting a flood before the sands had filled up the interstices of the brush that constitute the hodies of these constructions. So far everything has been favorable for the dams being solidified by the debris that is gradually accumulating in and above them, so that there is reason to hope that by the time high water does prevail the dams will have so filled that all danger will have passed of their being injured by the pressure or force of the flood. The general opinion among miners who have experience in damming the mountain rivers is that the new dams will stand; and the next point is whether they will so far check the flow of debris that the water will be sufficiently cleared as to be able to scour out the deposits in the beds of the rivers below.—*Grass Valley Union.*

ELECTRIC LIGHT IN A QUARTZ MILL.—The Butte (Montana) *Miner* says: On Monday evening the city council and city officials, together with a large number of other citizens, some accompanied by ladies, visited the Alice mills to witness the operation of the electric light. Notwithstanding a violent snow-storm was raging, the entire party was treated to a most beautiful sight as they approached Walkerville. On top of the hoisting works appeared a light, which in the escaping steam, seemed like a ball of fire rolling in the heavens, while through the windows of the mill the light shone beautifully distinct and cheerful. The party was met by Mr. Ruthrauff, who escorted them through the mills, showing the operation of the lights and explaining how the electricity was generated and manipulated. All remarked on the great steadiness and beauty of the light, and all pronounced it an entire success. The members of the council particularly were unanimous in expressing their satisfaction with the power and brilliancy of the light, and Mayor Valiton says will probably report unanimously in favor of its adoption by the city. The lights are now being run at the Alice all night with perfect success.

237 First St., San Francisco.

HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

GOLD SAVING

SILVER PLATED

Amalgamating Plates,

FOR QUARTZ MILLS AND GRAVEL CLAIMS.

ALSO, CHALLENGE SWINGING PLATES,

For use in Sluices for Saving **FLOAT GOLD**. Constantly on hand PLATE of all Sizes; are prepared to fill orders on short notice. Old Copper Plates Purchased. Replated or Gold extracted by our process, whereby we save the Copper and remove the Gold at a very small expense.

INGERSOLL

Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

GEO. R. FOARD, GEN'L AGENT,
No. 18, First St., S. F.

CAUTION.

To John B. Reynolds and the firm of Reynolds & Rix, and the Public generally.

Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the *Pacific Slope*, formerly under the agency of John B. Reynolds, but now under the sole agency of George R. Foard; and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the abovementioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.
New York, November 30, 1880.

INCERSOLL

ECLIPSE ROCK DRILLS.

The Most Economical Air Compressor in the Market.

MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-ltimers, thus avoiding all frame work. When required these Powers are made in sections for packing

**Scientific and Practical Books
on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER and METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$3.00 coin, postage free.

ST. DAVID'S,**A FIRST-CLASS LODGING HOUSE
CONTAINS 113 ROOMS.**

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

DODGE'S**UNEQUALLED****Concentrating Machinery**

FOR CONCENTRATING GOLD, SILVER,
LEAD and COPPER ORES.

Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

GLOVE.—Frederick H. Busby, 412 Market street, San Francisco. Patented December 7, 1880. No. 235,125. In the ordinary process of the manufacture of gloves a small strip or welt of the material of which the glove is made is placed at all the joints or seams. The object of this strip is to strengthen the seam. In cheaply-made gloves, without a welt, the threads are apt to draw out one of the meeting edges of the material. In the kid or leather of which gloves are usually made, the material is only colored on one side. But even if colored on both sides the welt is sure to show of a different color, since it is necessary to trim it after it is put in place, and the fresh cut shows the natural color of the flesh of the material. Moreover, in trimming the welt considerable loss of time and some expense are entailed, as it must be carefully done or there is danger of cutting the glove in the process, since it can not be done until the glove is finished. These objections are overcome by placing a doubled strip or welt of the same color and material between the seams of the gloves in such a manner that the colored surface only will show, and the necessity of trimming will be obviated. With the glove made in this manner the welt does not present an unsightly appearance in the glove; the welt being uniform color with the glove itself, instead of showing the natural color of the material, as is the case with a single strip.

SAFETY RAILWAY CAR.—Jean Denechaud, No. 108 Eighth street, San Francisco. Patented December 7, 1880. No. 235,135. The object of this invention is to prevent the cars from jumping the track and turning over where, by reason of a sharp curve, they incline to one side. The rail is made very deep, its outer surface being flat and smooth and set on its edge in slots prepared in the cross-ties. Its inner surface is provided with a groove formed by the double flanges projecting from the inner side. Under the car, and between the axles of the wheels, are elbow-shaped metal stays, supported by having their upper ends fastened to immovable lateral plates of metal joining the supports of the axles, and their lower edges provided with a channel or groove, in which move two bolts having horizontal rollers in their ends. These bolts work in opposite directions, and are at such a distance from the bottom of the car as to fit their horizontal rollers into the groove of the rails when directed therein. They are projected or withdrawn by means of a mechanism which may be operated from the car.

VEHICLE WHEEL.—Joshua M. Nelson, Oakdale, Stanislaus Co., Cal. Patented December 7, 1880. No. 235,167. The object of this invention is to provide a means by which heavy machinery and loaded wagons can be transported from place to place over rough or smooth roads without damage either to the machinery or wagons, or to the roads. And it consists of peculiarly-shaped sections of metal or metal-protected wood attached by springs to the felly of the wheel, and turning with the wheel, each section presenting itself to the ground and forming a continuous and traveling track on which heavy wheels of machinery and great wagons can run. This track can be put on or off with little trouble. It would be of much use to freight-wagons on sandy roads, or even on hard roads, as the draft is much reduced, and instead of wearing or cutting ruts, as is usually the case with heavy wagons, it will improve rather than injure the road.

FENCE.—Stephen H. Chase, San Jose, Cal. Patented December 7, 1880. No. 235,210. This invention consists in the construction of the double posts having an intervening vertical space which is adapted to receive the lengths or panels of the fence. These panels are made complete, either with parallel boards and vertical strips at the end, between which they are riveted, or with vertical pickets riveted between top and bottom of the rail. The panels are allowed in either case to move or work about the rivet, so that they may take different angles and adapt themselves to contour of the land over which the fence is to be built, and at the same time fit the vertical posts, between which they are wedged and secured.

TRAMWAY FOR CURVES AND CABLE GROPES.—Charles M. Chubb, Oakland, Cal. Patented December 7, 1880. No. 235,127. This device relates to certain improvements in wire rope or cable tramways, in which cars are propelled by means of a gripe attached permanently to each, and so constructed that it may be made to hold or let go of the cable at will. And it consists in a method of supporting and guiding the cable so that it will pass around curves of any desired radius, and in a peculiar gripe, which is capable of seizing the cable and of being carried by it around the curve, without interfering with the supporting pulleys or guides. By this invention a cable road can be constructed whereon a car can be made to take a route over any street despite the curves, and not be compelled to run along in a straight line.

AIR COMPRESSOR.—Edward A. Rix, 49 Fremont street, San Francisco. Patented December 7, 1880. No. 235,296. By this construction of this device a head is provided which renders it safe to run the piston close to it at every stroke without endangering any part; or if foreign substance should get between them discharge-valve may be used of much smaller area that there will be no great loss of power in opening these valves, as would be the case if a single large valve was employed having the same area of opening as that of the cylinder.

The Mexican Mine.

The Mexican mine, on the Comstock, wound up the year on December 1st with a balance on hand of \$46, having received \$384,664 and spent all but the \$46. Most of this money was spent on the joint shaft of the Sierra Nevada, Mexican and Union companies, Mexican's proportion of expenses being \$218,319. Then it cost \$21,032 to run the north lateral drift, Suro tunnel; salaries and wages, \$74,659; supplies and miscellaneous expenses, \$64,650. According to this only \$144,255 has been expended on the mine.

At the time of the last yearly report of W. H. Patton, the Superintendent of the Mexican, from whose report just published we take the above figures, the Sierra Nevada, Mexican and Union shaft had attained a depth of 30 ft. below the 400 level. It is now 60 ft. below the 2500 level, and will be sunk as fast as possible to the 2700 level, a diamond drill hole having been sent down to the depth of 200 ft. below the bottom of the shaft, which showed no indications of a serious increase of water. The slow progress made in sinking the shaft during the past year was caused by the shaft being employed to its fullest extent in hoisting, from the different levels of the three mines and the vast work of excavating the different tank and bob stations of the pump compartment, and then continuing up the fourth compartment and enlarging and retimbering the shaft to the surface. There yet remain about 1,000 ft. of the shaft to be enlarged and retimbered, which work will be resumed during the coming year, when not engaged in sinking, and when finished will increase the hoisting and ventilating capacity of the shaft 50%. The large pumping machinery has been in successful operation since April last, averaging 4½ strokes per minute and handling at the rate of 160 gallons of water per stroke from the bottom of the shaft to the Suro tunnel level.

No work has been done in the mine above the 1600 level. On that level the system of pipes designed to convey the water from the Union shaft to the Savage company's connection with the Suro tunnel, has been continued through the main north lateral drift on this level to the Union shaft, and now forms the outlet for the water pumped from that shaft.

The north lateral drift of the Tunnel company has been extended into Mexican ground and work has been temporarily suspended therein. By the terms of the contract the Mexican company pays \$70 per foot for running and properly timbering this drift and subdrain through their ground. By this temporary suspension of the work, after the expenditure of \$21,032.90, the stockholders will be relieved at present from the necessary assessments to carry on this work, and the money collected can be applied exclusively to the work of developing the mine.

The bulk of the report is taken up with a description of the work performed during the year, mainly prospecting. Although many streaks of heavy vein formations were found by the crosscuts and drills, no ore of any particular value was found.

[From the MINING AND SCIENTIFIC PRESS of Dec. 11, 1880.]

Twenty-Four Page Holiday Extra of the "Mining and Scientific Press."

We propose, in Christmas week, to print an extra large edition of the MINING AND SCIENTIFIC PRESS. It will consist of 24 pages, and will be handsomely illustrated with new and appropriate engravings, which are now being prepared. This edition will be but an earnest of the endeavors we are making to have the PRESS of 1880 excel its predecessors in all important features.

Among the many articles of value for information and reference in our this TWENTY-FOUR page number, will be the following:

RAINFALL AND TEMPERATURE IN CALIFORNIA. With this article is a very elaborate and extensive table, showing the monthly and total rainfall and temperature from 1870 to 1880, at the following important cities and towns in California: San Francisco, Niles, Livermore, Stockton, Sacramento, Auburn, Cisco, Truckee, Marysville, Modesto, Red Bluff, Fairfield, Merced, Petaluma, Tulare, San Mateo, San Jose, Gilroy, Pajaro, Salinas, Soledad, Redding, Delano, Sumner, Los Angeles, Caliente, Mojave, Colton, Napa, Woodland, Williams, Oakland, Ione, Fresno, Anaheim, Santa Cruz and Martinez. Nothing as comprehensive as this on the subject has yet been published.

A large illustration with description of Dodge's New Shaking Table Concentrator, a machine now in operation here.

COPPER ORES.—Methods of sampling and assaying. How they are bought and sold. Classes of ore and price per unit.

LEAD FUMES.—Analyses of fumes of lead furnaces. Formation of fumes; results of condensation.

OUR GRAVEL MINES.—Condition of our hydraulic mining interests. Late improvements. Projected enterprises.

LEACHING OF ORES.—Results of leaching on this coast.

GOLD AND SILVER REFINING.—Showing the methods by which the various operations are performed at the New York assay offices.

OUR NORTHERN COAST TRADE.—With engraving of one of the class of steamers engaged therein.

INDUSTRIAL NOTES.—The latest news of interest in the industrial world.

PLUMAS COUNTY MINES.—A description of the mines of Plumas county and their present condition.

RICHMANN ROCK DRILL.—A description of a new drilling appliance now being introduced in our mines.

CHLORINATION WORKS.—Engraving and article describing the process and machinery for a new method of chlorinating gold ores.

YOSEMITE IN WINTER.—A handsome engraving, drawn and executed by first-class artists.

These are only a few of the articles being prepared for this extra 24-page edition of the PRESS.

A Wonderful Fissure.

The more the late Ontario strike is thought of and the output of the mine talked about, the more wonderful the great Summit county fissure becomes. Only think, the mine has paid over \$3,000,000 in dividends and is not yet worked to the fifth level. The working shaft is now down to the 700 level and the vein cut at that point. Instead of decreasing in size or quality, the ledge was found 12 ft wide, clean ore and sampled from wall to wall, 700 ounces.

It may be said that a fair sample could not be taken in the way hand samples are generally made; but there is no doubt that the ore is as rich as any found on the 300 level, where the ore ran from 600 to 2,500 ounces.

The mine has paid over \$3,000,000 while working from the 400 level up, and over \$4,000,000 is now in sight. The average battery sample for 12 months, has been \$197 per ton. This is what tells the tale, and there are claims located east and west of the Ontario that will soon have the same tale to tell.

With the Parley's Park shaft down; the Lowell & Williamson under way; the McHenry middle cleared up; the Hawkeye mine developed; the Little Giant in the depths, and the other valuable properties on the east of the Ontario, worked for what they are worth, the latter company will not be enjoying this bonanza alone.

The mines on the west end are being developed rapidly, and the day is not far distant when the Ontario fissure will be worked from the head of Big Cottonwood to the mouth of Red Pine canyon.—*Salt Lake Tribune.*

News in Brief.

COAL prices are declining. MORE earthquake in Europe are reported. MADAME THEIRS died in Paris on Saturday.

FIVE firemen were hurned to death at Cincinnati Saturday.

FIFTY THOUSAND soldiers will be sent to Ireland, if necessary.

FURTHER legislation on the Indian affairs is proposed in Congress.

A SHOCK of an earthquake was felt at Seattle, W. T., Sunday evening.

DURING the late storm, snow fell to a depth of three ft. at The Dalles, Or.

EAST PORTLAND, Or., experienced a slight shock of earthquake Sunday night.

MOUNT BAKER, in Washington Ter., is throwing out fire and smoke from its summit.

CONTRACTS have been let for grading 18 miles of railroad from San Diego northward.

JAY GOULD's conservatory on the Hudson, which cost \$150,000, was hurned Saturday.

SPAIN wants an amicable agreement with the United States about duties on certain goods.

A BITTER war of rats is anticipated between the Western Union and American Union telegraph Co.

NINE-TENTHS of the business portion of Pensacola, Fla., was destroyed by fire Saturday night.

GOULD has bought the privileges of the International Railway Co. from San Antonio to the Rio Grande.

DURING the canal season the largest movement of grain ever made by the canals of New York took place.

SAN SIMON and Leffinwells wharves, San Luis Obispo county, were considerably damaged by the late storms.

IN a fight with "moonshiners" near Cooksville, Tenn., one revenue officer was killed and another beaten nearly to death.

A BILL has passed the Brazilian Senate making naturalized foreigners and freedmen eligible to seats in the Chamber.

THE San Francisco Board of Education has declared that hereafter the positions of all lady teachers who marry, will be declared vacant.

THE jury in the case of Schroeder, for the killing of Dr. Lefevre, at Oakland, after being out 72 hours returned a verdict of not guilty.

A CIRCULAR regarding admission to the grade of cadets in the revenue marine service, has been issued by the Secretary of the Treasury.

It has been decided that General Howard will not return to the Department of the Columbia, but will have an Eastern Department.

THE Petroleum World of Titusville, Pa., charges that for the 19 months ending a year ago last winter the Standard Oil Co., made \$19,000,000.

THE Reading and New Jersey Central roads are said to have united to build a line from Harrisburg to Pittsburg parallel to the Pennsylvania Central.

A RESOLUTION has been adopted in the House of Representatives, expressing sympathy with the laboring classes of Ireland in their present trouble.

EX-GOVERNOR CHAMBERLAIN, of Maine, makes public the fact that Mackay the Nevada millionaire, and a wealthy citizen of Philadelphia, have given \$50,000 each for the endowment of Bowdoin College.

THE proposal to settle the Greek questions by arbitration of the Powers has not yet been formally made. It is thought that Germany and Austria do not favor it.

SECRETARY OF Navy, Thompson has tendered his resignation, and will accept the Chairmanship of the American branch of the Panama Inter-oceanic Canal Company.

THE demand for vessels in the trade between America and Europe is greater than the supply, and 95 vessels, mostly steamers of the largest class, are building on the Clyde.

PASSENGER arrivals in San Francisco last month aggregate 4,439, and the departures 4,482, a net loss of 43. The arrivals from China and Japan were 453 and the departures, 1,363.

THE Persians have destroyed Uchui, killing many inhabitants. They afterwards defeated 12,000 Kurds at Mergewar. Sheik Abdullah is organizing another force for an attack in the spring.

THE Pope has conferred on D. T. Murphy, a wealthy merchant of San Francisco, the hereditary title of Marquis, in recognition of his great services to religion in America and Europe.

DURING the last 11 months the port of New York has made a relative gain in the grain movement over other ports, showing 51% as against 49% of receipts during the same period of last year.

NEW ORLEANS is now the fifth grain market east of the Rocky mountains, being surpassed by New York, Philadelphia, Baltimore and Boston. Boston has shipped 20,000,000 and New Orleans 17,000,000 bushels this year.

THE Senate has confirmed the following nominations: John B. Neil, Governor of the Territory of Idaho; Stephen P. Twiss, Associate Justice of the Supreme Court for the Territory of Utah; Warren Bristol, Associate Justice of the Supreme Court for the Territory of New Mexico.

[CON.]

Vaccination for Scab in Sheep.

EDITORS WATCHMAN:—I desire to announce to your readers that I have discovered a method of protecting sheep from the scab disease by vaccination. The principle is identical with that involved in vaccination to prevent smallpox in the human species. I do not claim that my method of vaccinating sheep will prove an absolute prevention of skin disease, but it will either prevent it or reduce the disease to a milder form, as vaccination in human kind reduces smallpox to varioloid. In the case of sheep there may, in some cases, be a slight surface irritation of the skin which can be easily removed, but there will be no attack of the scab in its well-known virulent and penetrating form. Anyone desirous of inquiring into this new method of meeting the scab disease may address me at the Baldwin Hotel, San Francisco, S. H. KENNEDY.

San Francisco, Dec. 5th.

P. S.—Address, after January 15, 1881, Omaha, Nebraska.

HALL'S VEGETABLE SICILIAN HAIR RENEVER is a scientific combination of some of the most powerful restorative agents in the vegetable kingdom. It restores gray hair to its original color. It makes the scalp white and clean. It cures dandruff and humors, and falling out of the hair. It furnishes the nutritive principle by which the hair is nourished and supported. It makes the hair moist, soft and glossy, and is unsurpassed as a hair dressing. It is the most economical preparation ever offered to the public, as its effects remain a long time, making only an occasional application necessary. It is recommended and used by eminent medical men, and officially endorsed by the State Assayer of Massachusetts. The popularity of Hall's Hair Renever has increased with the test of many years, both in this country and in foreign lands, and it is now known and used in all the civilized countries of the world.

FOR SALE BY ALL DEALERS.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORN—San Francisco.
A. C. KNOX—Pacific Coast.
G. W. McCREW—Santa Clara county.
M. P. OWEN—Santa Cruz County.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
N. E. BOYD—San Bernardino and Los Angeles counties.
JARED C. HOAG—California.
O. M. THOMPSON—Fresno County.
B. W. CROWELL—Colusa and Yolo counties.
D. W. KELLEHER—Fresno, San Benito, Monterey and San Luis Obispo counties.
W. O. WARREN, Sonoma County.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove walled with aquariae constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & Co.'s MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill and Mining Company,
SAN FRANCISCO, CAL., DECEMBER 10, 1880.

At a meeting of the Board of Directors of the above-named Company, held this day, Dividend No. 35, of Fifty cents (50c.) per share, was declared, payable on Wednesday, December Fifteenth (15th), 1880. Transfer books closed on Monday, December Thirteenth (13th), 1880, at three o'clock P. M.

WM. WILLIS, Sec'y.

Office—Room No. 29 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company.

Nevada Block, Room 37, San Francisco, Dec. 15, 1880.

At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 62) of Fifty (50) Cents per share was declared, payable on Monday, December Twentieth (20), 1880. Transfer books closed until the Twenty-first (21) instant.

W. W. TAYLOR, Sec'y.

REGULAR DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

SAN FRANCISCO, DECEMBER 2, 1880.

At a meeting of the Board of Directors of the above-named Company, held this day, Dividend No. Twenty-two (22) of Seventy-five (75) Cents per share, was declared payable on Monday, December Thirteenth (13), 1880, at the office in this city, or at the agency of the Nevada Bank of San Francisco in New York.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

EXTRA DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

SAN FRANCISCO, DECEMBER 2, 1880.

At a meeting of the Board of Directors of the above-named Company, held this day, an Extra Dividend No. Twenty (20) of Seventy-five (75) Cents per share, was declared payable on Monday, December Thirteenth (13), 1880, at the office in this city, or at the agency of the Nevada Bank of San Francisco in New York.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company.

SAN FRANCISCO, DECEMBER 7, 1880.

At a meeting of the Board of Directors of the above-named Company, held this day, a dividend (No. 12) of Twenty-five (25) Cents per share was declared, payable on Wednesday, December Fifteenth (15), 1880, at the office of the Company, Room 19, No. 328 Montgomery Street, San Francisco, Cal. Transfer books will be closed Friday, December Tenth (10), 1880.

JOSEPH NASH, Secretary.

DIVIDEND NOTICE.

Office of the Western Mining Company (Contention Mine), San Francisco, December eighth (8), 1880.—At a meeting of the Board of Directors of the above-named Company, held this day, a dividend No. six (6) of seventy-five cents (75c) per share was declared, payable the tenth (10th) instant.

D. C. BATES, Sec'y.

Office—Room 79 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

ANNUAL MEETING.

THE ANNUAL MEETING OF THE

Stockholders of the Gould and Curry Silver Mining Company

Will be held at the office of the Company, Room No. 60, Nevada Block, No. 309 Montgomery Street, San Francisco, California, on Monday, the twentieth (20th) day of December, 1880, at one o'clock P. M. Transfer books will be closed on Thursday, December sixteenth (16th), 1880, at three o'clock P. M.

ALFRED K. DUBROW, Sec'y.

Alpha Hydraulic Gravel Mining Company.

Principal place of business, San Francisco, California. Location of works, Alpha Hill, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Nineteenth (19) day of November, 1880, an assessment (No. 2) of Twenty (20) Cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. gold and silver coin, to the Secretary, at the office of said company.

Any stock upon which this assessment shall remain unpaid on the Twenty-fourth (24) day of December, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Tenth (10) day of January, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plate castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores; Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also

SPERRY'S

WROUGHT IRON FRAME

FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in millinery and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

DEWEY & CO'S

Scientific Press

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

The Dodge Ore Concentrator.

The engraving on this page represents an improved ore concentrator invented by Miles B. Dodge of this city, a gentleman who has had considerable experience with mining appliances, being also inventor of the well-known Dodge rock-breaker and the Dodge furnace. This is a percussion table concentrator, and its principal feature consists in forming on the inclined table, above the point at which the pulp is received upon it, a depression into which the heavier concentrations will pass, and from which they are continually discharged, while the lighter particles will pass downward with

stopped or slackened, the concentrated material is at any rate stirred and spread so it will move downward to the depressions or boxes intended to receive it. When these become filled their contents are removed.

Mr. Dodge, in examining the various ore concentrators, noticed that when the comminuted ore, mingled with water, was spread in a film upon the inclined percussion table, the tendency of the heavier portions was to move upward, unless it became packed in too heavy masses. He became convinced, moreover, that this tendency was more marked when the light gangue was washed away from the pulp as soon as it was deposited on the table.

It was with these principles in view that he invented the concentrator herewith illustrated, which is designed to overcome the obstacles by

about the point indicated by the double arrow and C.

Above the mouth of the distributor, and nearly at the upper end of the table, is a well or depression, as shown, this being formed across the table and provided with an outlet (indicated by an arrow), through which the concentrated material passes, this outlet being regulated in size in proportion to the mineral in the pulp.

Over this depression is a perforated pipe H, through which clean water is admitted to the well or depression, and thence flows down the table, part of it going out of the hole with the concentrations.

As the pulp falls on to the table it is concentrated in the usual way, the heavier metallic portion settling to the bottom and the gangue

while the concentrations go the other, both being discharged continuously.

The lower end of the table is formed with a concave so as to catch any mercury that may be in the pulp. The table itself is mounted on an adjustable bed, which by means of the screws J, may be raised or lowered to regulate the incline of the table. The frame and movable parts of the table are of iron, and the concentrator is an exceedingly strong one. A machine of this pattern may be seen at work daily in this city at the Empire foundry of Savage & Son, 143 Fremont street. These machines are now so perfected that they are being shipped to the mines.

THE Deadwood and Golden Terra mines, now practically under the same ownership, have been

MILES B. DODGE'S IMPROVED PERCUSSION TABLE ORE CONCENTRATOR.

the current and be carried away, the action being continuous.

Percussion tables as ordinarily made are suspended in such a manner as to have an end or side-shake motion, or a combination of both motions, imparted to them. The table is set on an incline and the pulverized ore is brought upon it in a state of suspension in the water, the motion of the table causing the ore to so arrange itself that the heavier grades will sink on to the surface of the table while the lighter and worthless gangue will pass on down with the stream of water. Riffles, depressions, boxes and various other devices are employed to collect the heavier valuable portions, these being placed on the line of flow of the substance being operated on.

In all of these percussion tables it is commonly necessary to slow down or stop occasionally to push downward or forward the mass of concentrations which collect on the inclined table at a point near where the material is received upon said table. If the motion is not

continuously discharging at different ends the gangue and concentrations, and to take advantage of the upward tendency of the concentrated material by providing a receptacle for it immediately on its separation. The work done by the machine would go to show that he has been successful in applying the principles to practice.

The inclined percussion table is suitably supported in a frame so that an end shake may be imparted to it by means of the cam D, said cam throwing the table forward by striking against the lug or tappet E, and the spring F, drawing it back. On the reverse movement the table strikes against the huffers G, and its movement is suddenly stopped.

The pulp from the hatters is passed into the sluice A, and goes on to the distributing board B, which is provided with spreaders, as shown. The sluice and distributing board are inclined in the opposite direction from the table, as the engraving shows, and the pulp is deposited on said table a short distance below the upper end,

passing off down with the water. A riffle on the table, under the spreader, checks the heavy material, and when checked, the percussive action of the table tends to move the heavier particles up the incline of the table, until they reach the well or depression, where they are caught and passed out of the discharge to a suitable receptacle.

The fresh supply of clean water, carrying no pulp, coming on to the table through the perforated pipe H, flows down over the concentrations and assists in cleaning them and in carrying off the gangue.

This action is continuous. The advantage of the depression above the point at which the ore is received is obvious. It forms a receptacle where the concentrated material is taken out of the way of the pulp. When these concentrations are caught in boxes or riffles below where the pulp is fed to the table, the whole mass of pulp and water passes over them and loss ensues. Here the separating action takes place immediately, and the gangue goes one way,

reincorporated under the name of Deadwood Terra, and the new organization paid its first dividend in New York this week. The Deadwood mine has previously paid 11 dividends of 25 cents per share, and the Golden Terra three dividends of 25 cents per share. Each mine was divided into 100,000 shares, and the consolidated organization, we believe, has 200,000 shares, so that the dividend of 25 cents per share paid aggregates \$50,000, and makes a total of \$400,000 paid by both mines this year.

The million product of Silver Reef district for the present year will foot up nearly \$1,100,000, and as this showing is made with less than an average of 20 stamps, it must be admitted that the output will bear favorable comparison with the yield of any other silver district on the coast. The Miner says that enough ore is there to treble the product, but what is lacking is the capital and energy to put up the stamps.

CORRESPONDENCE.

We admit, under sized, & more of correspondents.—Ers

Mining Districts in the High Sierra—Meadow Lake.

EDITORS PRESS:—Gradually the gold and silver bearing districts have been creeping up both sides of the Sierra Nevada. For many years at first, mining for the precious metals on the westerly-lying slope of this range was confined to its foothills, and on the east to the Wasboe and other mountain chains lying out in the deserts beyond. Some 16 years ago the first important discovery of auriferous deposits lying well up in the Sierra, was made in the Meadow Lake district; this find having caused a wide spread of excitement and induced quite a heavy immigration into that district. This immigration, however, proved premature, the refractory character of the ores there having retarded developments, and finally worked an almost entire depopulation of the district; which, under improved methods of treating the ores, has only quite recently begun to show signs of returning vitality. It is now the opinion of many who have had good opportunities for forming a correct judgment, that Meadow Lake will in the course of a year or two become an active and prosperous mining camp.

The next mining locality discovered at a considerable altitude in the Sierra Nevada, was the

Kearsarge District.

Lying on its easterly flank in Inyo county, and at an elevation of about 7,000 ft., being nearly on a level with the Meadow Lake mines. At this locality several silver bearing lodes were opened, and a mill put up, at which a good deal of hullion has up to this time been made. But work there, while it has been kept constantly in progress, has gone on slowly, the mines, some of which afford good evidence of value, being mostly owned by men of small means. The locality is also remote and difficult of access, which has further tended to retard improvements; and it will not surprise even its most sanguine friends if Kearsarge makes but moderate headway for some time to come.

The next mineral discovery of note made at anything like an Alpine height was

The Mineral King Group of Lodes.

Situated on the west face of the Sierra, in Tulare county, and lying nearly as high as the Kearsarge mines. The lodes here, also silver producing, are numerous and very heavy, but nothing positive has yet been demonstrated as to their value, hardly any effective work having been done upon them. Their owners, however, entertain a good opinion of their merit, proving their faith by expending every year upon them as large an amount of work as their limited means will admit, very little outside capital having as yet been invested in the district. The past summer a forward movement was made at Mineral King, which is to be followed up vigorously next year, and will, it is expected, result in the production there of some, and possibly a good deal of bullion.

The last of these mineral finds lying far up in the great snowy range consists of a metalliferous belt some 20 miles long and covered by what are known as

The Tioga, Prescott and Homer Districts, situate, not like the others, on the sides, but on the very crest of the Sierra, being partly in Mono and partly in Tuolumne counties, California. Having spent a portion of last summer and autumn in that region, remaining until most of the miners had left, I send you the following items of information in regard to it, under the supposition that they will interest some of your readers.

The first and most important of these districts, the Tioga, was discovered in 1879. Not, however, until the past summer, was any considerable population gathered in this region, or much work done, because of its great altitude, over 8,000 ft., and the depth to which the snow falls in winter.

This trio of districts is traversed in a northerly and southerly direction by two ore-bearing belts or channels, the most easterly of which carries gold, and the westerly silver and other metals. The latter, which strikes along the west slope of Mt. Dana, is a powerful vein, measuring over 100 ft between the walls. The country to the west of this lode is granite, to the east, slate and porphyry, it being a contact deposit. The ore here obtained assays well in silver, the tests ranging from \$20 or \$30 up to \$300 or \$400, and in exceptional cases to \$2,000 or \$3,000 per ton. There appears also to be a good deal of it, though on this point it would be premature to hazard any estimates, as no explorations of consequence have been made in either district. All that can be affirmed of the country in its present undeveloped state, is that it is a good one to prospect. That the claim-owners have great faith in it, it is needless to say; as when did the locator of a mine ever permit himself to doubt that it held somewhere in its bowels a veritable bonanza? It is more to the purpose to know that several disinterested and competent experts, who have visited and examined these districts, have expressed much confidence in their value.

What Has Retarded the Progress of the Country

Has been the inordinate prices asked by locators for interests in their claims, the most of them excited by the great size of the veins and the good surface exhibits of ore so generally obtained, having held their grounds at figures too high for mines so little proven. Had these men not seen things quite so large at the start it is likely that they would have succeeded in disposing of some of their claims to parties who visited the country early in the season with the purpose of investing, but were discouraged from doing so by the extravagant ideas of the miners. Later in the summer, some sales were effected, but not in time to admit of any large operations being started upon them. Among others who procured interests there before the winter came on are a number of residents of this country, who, it is said, will do some thorough work next season, getting at it as soon as practicable. Among their improvements will be a mill, which, if prospects warrant, is to be of very large capacity. Large reduction works will, in fact, be the rule there if any at all be required, as there will probably be plenty of workable ore if it only holds in depth. Some of the more sanguine miners affect to believe that we shall as regards size of mills see the experiences of Deadwood, Dakota, there repeated. So far as wood and water are concerned these districts are better conditioned than Deadwood, nor are the winters there any colder than in that part of Dakota, though perhaps somewhat longer and the snow deeper. Among others who have obtained large interests here are several

San Francisco and Eastern Parties, All of whom through their associates and agents express a purpose to get to work next spring as early as practicable, and test their properties thoroughly.

A man named Bunker, agent for some Eastern investors, a Boston company, I think, has got hold of a large extent of ground in the Tioga district, which is generally accounted valuable, and which, according to report, is to be prospected in the spring, and outfitted with a big mill if ore developments will justify. That all this rumored work will be undertaken and he followed by results calculated to warrant so much mill building, let us hope. Still when the local press, the itinerating scribe and the Tioga claim holder unite in assuring the world that a vast population of miners will, of a certainty, be gathered into these districts the coming summer; that cities will spring up and multitudes of great mills be erected there, it will be safe to largely discount such statements, though doubtless these ardent souls believe they will each and all be realized.

Sonora, Cal.

Silver Mining in Peril.

EDITORS PRESS.—The great question before the mining community will soon be, is silver mining to be abandoned or not? and this question will arise in the one, is the silver dollar to be a part of our currency or not? The people want it, but the banks say they do not, and which now, I will ask, is the power behind the throne, the people or the banks? I say the banks, what can the people do when a confederation of 2,000 national banks, are all thinking and moving for one purpose in the halls of Congress? Their power in the future we can be assured, is equal to all they have had in the past. Already is there a settled move against the interest of silver mining, in the efforts of Secretary Sherman (the national banks' conspirator), to (1.) cease the coinage of the standard dollar, (2.) increase the weight of any future coinage to 450 instead of 412½ grains. What is this increase of silver equal to, but an increased discount in crude silver, and does not silver bullion have enough to contend with now in the average discount of about 15%? what other business can stand such a deduction on its values and thrive? It is impossible for silver mining to do so, with any increase of discount.

Miners as a general thing pay but little attention to financial questions, but things are now getting to a pass, where they are compelled to for self-preservation, silver miners especially, and it stands every one in hand to raise his voice in favor of the standard dollar—the full and better coinage of silver, as well as gold—or they had better quit silver mining. This question will have able defenders in both the House and Senate of the U. S. Still against them, stand the power of the banks. It is the people who must begin to talk and act, and talk in such a way as to strike somewhere against the influence that is now about to crush the silver mining interest of the Pacific coast. In Senator Jones the silver miner has an able advocate, but Senator Jones must have the voice of the people to support him. In the interest of the banks Secretary Sherman piled up in the Treasury over \$70,000,000 of silver dollars but the pressure of the people forced its outgo. The past has shown that the people want it, if the powers will only let them have it, and the more coined, the more will be wanted, the less will be the discount, and in turn so much more profitable will be silver mining.

In this question the State of Nevada has a

mining State. A citizen of Nevada informed me a few days ago that his discount on his silver product was \$165,000 and he was unable to continue longer and in fact has shut down his mills and mines.

If the past has produced failures, in consequence of such heavy discounts, what will be the condition of the interest, if further pressure is brought upon it? That one of the great resources of wealth of this coast is in danger, should arouse the people to action as the depression of so vital an interest is the depression of all interests, in proportion. But the question comes, what can the silver miners of Nevada, Utah, Arizona, Montana, Idaho and California do? Why, I will answer, they can watch their representatives in Congress, and express to them their sentiments, and watch then, to see if they do not bow before the golden idol of the banks. And here let me say what is going to be attempted if the people are not watchful of their interests:

(1.) The demonetizing of silver.

(2.) If the way is not clear to demonetize, then to increase the weight of the dollar to bring it equal or better than gold.

This increase of silver in the dollar is as we before stated equivalent to an increase in discount, and I ask my silver mining friends, can you stand it? If you cannot then watch, and fight it.

ALMARIN B. PAUL.

December, 1880.

A Naturalist at Santa Barbara.

EDITORS PRESS:—The best place at Santa Barbara for collecting marine animals is—Santa Barbara. To this conclusion I arrived after wandering to Rincon, eastward, and almost to Moore's Landing westward. The wind blew pretty roughly from the southeast the day I went to Rincon—the people called it a storm—and next day the beach at Santa Barbara was strewn with kelp. Huge tangled masses of laminaria and other large algae, ending in "roots" formed of a maze of interlacing fibers, lay mixed with detached fronds and disjecta of all kinds. In these netted roots live many curious objects, not often found on the sea-shore. There is the home of the serpent-star or ophiuran, who wriggles himself out as his home is invaded by axe or knife, and coolly proceeds to drop himself to pieces before he can be secured. A quick plunge in fresh water is the only cure for this suicidal propensity. Probably his nerves are less shocked by the unsalted element than by alcohol; at any rate he drops to bits in the latter before he dies—a terrible warning to drunkards.

All the serpent-stars were of one species (an *Ophiotrichis*), but in the same hiding-place live numerous crustaceans, the commonest of which is a little shrimp, (which isn't a shrimp, but its only right name is its scientific one, so shrimp is the nearest English), having two large front claws or hands, one of them much larger than the other. This little fellow has the power, by forcibly bringing together the fixed and movable fingers of his hand, to produce a snapping noise the loudness of which seems out of all proportion to the creature's size. His objections to being disturbed, even though he be placed in salt water, are shown by vigorous snapping, and in alcohol he snaps till he dies. Then various curious worms, some living free, others dwelling in tubes of their own formation, or in hollow twigs of the algae, are found in abundance, and a few shells are entangled in the meshes of the roots.

What is this bright red object, about 10 inches long, with purplish-brown warts all over, that is crawling on the sand among the seaweed? It is a holothurian or sea-cucumber, and I quickly secure it, although I know that in alcohol it will lose all its beauty of coloration. It is the first I have seen alive, so I must have it. In the ocean these sea-cucumbers are abundant, and are common on the sea-shores of the Islands of the Pacific. They are eaten, and considered a delicacy by many nationalities. They are the trepan of commerce, the *beche de mer* of the French.

And what is this bunch of elongated yellowish objects with bright red tips, their narrow ends united in a common stalk which is shrouded by a growth of sea-moss? In shape, each one is like an attenuated Indian club. This is an animal, or rather a colony of animals, and is one of a tribe known to naturalists as compound ascidians. With this name the non-naturalist must be satisfied unless he can find another. Organless though they seem outwardly, within they are tolerably complex, having a very elaborate breathing apparatus, stomach, intestine, heart and nerves. Cutting across the stalk to which the colony is united, tiny sparks of golden light appeared, and the same occurred when the animal was handled in the dark. The light was not a paly diffused phosphorescence, but in distinct sparks or points.

Here is another ascidian. This is not a compound, but a simple or single organism. It looks like a leather bottle, or a small yellow squash—a living pulsating squash. Now we are vertebrate animals, or animals with a backbone, so are all mammals, so are birds, so are reptiles, and so are fishes, (true fishes, not shell-fish and star-fishes); the lowest fish,

and little in common with other fishes except the possession of a backbone; and, strange though it may seem, the larva, or young of certain ascidians have a sort of backbone, and many naturalists tell us that it is to these humble creatures that we must look for the vertebrate parent stock.

Compare a hag or a lancelet with an ascidian, and certainly one is about as good an animal as the other, so don't be too proud of your backbone.

Here is another sort, crawling, purple-striped object, with four horns or tentacles in front, and looking more like a prettily-colored slug than anything else. It is in fact a sea-slug—with a difference. A true sea-slug (and you can find them here, attached to the under side of rocks) has no tentacles at the head end, and bears its gills externally. This creature we have found does not have its gills exposed, and has a small shell under the skin in the broad slit you see on the back. Below, it has, like other mollusks, a fleshy foot, on which it crawls. Call it an aplysia, and you will err greatly.

Many Kinds of Shells

Are found at Santa Barbara, some of them quite rare, found only in certain localities, or when a storm tears off the algae or stones to which they were attached, and hurls them on the shore. A large kind of cowrie or *Cyprea* (*C. spadicea*) is one of the rarer shells, and I was told I was fortunate to pick one up upon the beach. A still rarer shell is sometimes procured upon Santa Cruz Island, about 25 miles away. It is the delicate paper nautilus (*Argonauta Pacifica*) and is not truly a shell, but the egg-case of the female of a creature having eight long arms, and in its anatomy as well as general appearance closely resembling the octopus or so-called devil-fish, so common all along our coast. So fragile are these floating shells, floating in from far away on the broad Pacific (for the Argonaut is a dweller in the open ocean) that they must be gathered as they come in upon the wave that bears them. A dash upon the rocks is fatal to their integrity.

Another oceanic shell (*Janthina Globosa*) floats in upon the shore at Santa Barbara in stormy weather. It is fragile, small, bright violet in color, and a true shell, but the creature that forms it forms also a curious egg-raft, fitted to float upon the ocean wave.

The Hermit Crabs

May be thanked for examples of many shells, the original owners of which do not live within ordinary tide-marks. These curious-looking free tenants of houses they did not build, do not take possession by forcible ejection of the peaceful molluscan holder and owner, as their human equivalents sometimes do, but occupy shells deserted by the death of the latter. As each heir of the mollusk builds his own house, increasing it to suit, there is no dispute about titles, and the hermit trots off unmolested with his house on his shoulders, or rather, over his abdomen, a part of his anatomy which is not favored by nature with a hard covering. When he has outgrown his shell, he leaves it to look for another. Some singular forms of crustacea live in holes in the sand; others are parasitic in tubes of worms, or inside the shells of clams; others inhabit the gills of fishes, while others are the so-called "whale-lice." The resident of Santa Barbara has every opportunity to make a large collection of this extensive class of creatures—the insects of the sea.

On every pile of the old wharf, as evening approached, solemnly sat a black cormorant, and the gulls had a rich harvest on the kelp-strewn beach.

Birds.

Rincon, some 14 or more miles east of Santa Barbara, has quite a reputation as a good collecting ground, but we were unfortunate, procuring little but the large pyramidal shells popularly called castle-tops, and some peculiar marine worms. On our way we noticed the great abundance of the sparrow-hawk, which sat pertly perched upon the fences and telegraph wires as we drove by. A very useful bird to man is this same sparrow-hawk, and should not be shot, as he is too small to hurt poultry, but feeds largely on the young of such pests as the ground-squirrel and the gopher.

There is only one native bird which, for commonness, impudence, can compare with the introduced English sparrow, and that one is what is called here the blackbird, or sometimes Brewers' blackbird. This bird will coolly let you drive within two or three ft. of him, and, when nesting, will brush close by you with a scream, as if to frighten you off. From birds to

Whales

Is a long stride, but we must take it. Evidences of the abundance of these monsters of the deep are plenty all along our coast. Ribs and vertebrae are scattered upon the beaches from Humboldt to San Diego. With a "whale fishery" at almost every convenient point, at San Francisco, at Half Moon bay, at Monterey, at Port Harford, at Point Concepcion, and I know not at how many other points, the wonder is how the whale, at least the California gray whale, manages to exist. The broad entrance path to Monterey Mission church is paved with the centra of the vertebrae of whales; and the threshold of many doors in the same place are similarly constructed. At Port Harford the first object I saw was the axis or second vertebra of some cetacean, and at Santa Barbara a jaw bone formed the curb of a drive in

MECHANICAL PROGRESS.

Possibilities of Emery.

When a piece of hardened steel is to be reduced in size it is useless to attempt the ordinary methods of turning, planing or filing; the obduracy of the hardened material rendering all such attempts abortive. Hardened steel or case hardened iron—which is hard steel externally—must be ground, instead of being wrought. The difference between working or “tooling” metals of great hardness is shown in the impossibility of filing, chipping or turning hard steel, and the facility of reducing it by grinding. It would be futile to shape to edge a hardened turning tool by the file, and yet the hardest turning tool is put into shape by the grindstone. These facts seem to intimate that there is a possibility for the use of a cheap abrading material to take the place of costly steel tools, that must be forged, shaped, tempered and adjusted to do any work; and when a small portion of the work is done must be again forged, shaped, tempered and adjusted.

This continuous round of forging, hardening, tempering and adjusting to work is a drag on work. It is impossible to keep a turning or planing tool in serviceable shape for any appreciable time. A large proportion of the time of the workman is used up in keeping tools in order. The grinding of turning tools seems to furnish a lane leading out of our costly practices; and it is possible that the producer of abrading wheels may assist our practical mechanics to an improved and better way.

It is acknowledged that the processes of turning and boring—exterior turning and interior turning—do not give exact or repeated results. We cannot turn a shaft, or journal, and be sure it is “round,” or really cylindrical; and we cannot bore a box and swear that it is true from end to end; or, if true, that it will fit the turned journal. Why cannot these two processes be made to agree? Because the methods used are so different. The shaft, or journal, is turned by a fixed and really rigid tool, and every turn, of even a thirty-second of an inch can be seen, and whenever there is the slightest deviation from the right line it can be instantly corrected; and besides this, any untruthfulness can be rectified by well-known methods, as filing, grinding with clamps, or running over with metal boxes charged with emery and attached to the tool carriage.

But in internal turning the operator cannot see any distance, and must depend on the integrity of the tool and the accuracy of the lathe. In such work the introduction of a tool adapted to the aperture appears to be the only means of approaching accuracy.

There is no question that better fits and better finish can be got by the grinding than by the cutting process, and these fits and this finish when once made would be permanent, and take the place of our present loose method of gouging out and cutting in. What is needed is a surface solidity and permanent wear, and not a mere coming together.—*Boston Journal of Commerce.*

RENDERING IRON FIRE-PROOF.—Iron, as is well known, is in some respects the very best material that can enter into the construction of a building, and in other respects it is the worst; of the latter phase we would speak. It is hardly necessary to refer to the fact that iron pillars and joints are very susceptible to the influence of heat, and that a fire of small magnitude will soon warp and twist them to such an extent that the fall of the whole structure becomes a certainty. Iron will endure pressure and strain under ordinary circumstances, but will quickly succumb to the influence of heat. To guard against this and to place it in the front rank of materials used in construction, it is proposed, with reason, too, that in all buildings in which iron is a factor, it be encased in some non-conductor of heat. Terra-cotta has been suggested as the remedy. It may detract from the appearance, but that should be subsidiary to safety. If iron can be rendered a salamander, it is certain to rise in favor, because it possesses all the other desirable properties required in the construction of buildings—lightness, strength and beauty.—*Insurance World.*

SIZE OF GOVERNOR PULLEYS.—The *Manufacturer and Builder* gives the following rule for fixing the size of governor pulleys: To find the diameter of the governor shaft pulley, multiply the number of revolutions of the engine by the diameter of the engine shaft pulley, and divide the product by the number of revolutions of the governor. To find the diameter of the engine shaft pulley, multiply the number of revolutions of the governor by the diameter of the governor shaft pulley, and divide the product by the number of revolutions of the engine.

A REMARKABLE CASTING.—The most novel exhibit shown at the Brussels National exhibition by the Seraing works is a remarkable casting. It consists of what is practically the whole cast iron works of a marine engine, with a pair of cylinders about 20 inches in diameter by 20 inches stroke, cast in one piece—bed plate, condenser, air, and feed, and bilge pumps, standards, cylinders and exhaust pipe.

Hot Journals.

One of the most important parts of an engineer is to see to it that the various bearings of the machinery in his charge are smooth, of uniform surface, and rightly adjusted. This apparently simple duty frequently requires the exercise of his best judgment; it is not only necessary that the journal-box surfaces be close to the journal, but it is frequently just as necessary that the journal boxes be prevented from accidentally approaching closer to the journal. In a steam engine under full head of steam the play of one-sixty-fourth part of an inch between the crank-pin boxes and the crank pin may be sufficient to jar the whole engine; and yet, if the engineer in endeavoring to take up this lost motion, should accidentally overtighten the crank-pin boxes, the chances are that a broken crank pin or pitman, and a knocked-out cylinder head, will serve as an illustration of the union which is apt to take place between the crank pin and its boxes under such circumstances.

Many an apparently unaccountable break in a revolving shaft has occurred from a defective bearing. Heavy shafting, carefully lined in hangers secured to the workshop ceiling, may for months run without any sign of heating; but a pile of iron castings, or other heavy weight, unequally disposed on the floor overhead, may cause sufficient deflection to expose the revolving shaft to one of the most destructive strains, and cause one or more of the hanger bearings to heat. In machinery the wearing away of one of the parts may subject another part to destructive strain, and it generally requires the exercise of experience and judgment in the construction and handling of the machinery, in order to prevent the harm. Many tons of coal have been wasted, and much wear and tear of belts and machinery caused by inattention to these defects.

In steam engines, especially, the adjustment of the journal boxes requires close attention. The expansion of the journal by heat, the quality of the lubricant used, the condition of the bearing surfaces and the amount of pressure they will be subjected to, exclusive of dust, speed of revolution, etc., should be taken into account. In all metal there is more or less elasticity, and when one box of a journal is by means of its screw bolts drawn to the right position in regard to its journal, it should also bear solidly on the other box, in order to maintain the adjustment of the boxes to the journal; if this precaution is neglected, when the shaft is revolving, the elasticity of the screw bolts appears to act to cause an approach of the boxes, thereby squeezing out the oil from between the bearing surfaces, and causing them to heat or grind. It appears that the continuous motion in one direction of one metal in close contact with another, tends to produce a still closer contact, and finally a union of the metal surfaces; the lubricating oil, by preventing direct contact of the metal surfaces, opposes this tendency, and the use of liners or equivalent means to prevent the improper approach of the journal boxes, aids the oil in insulating itself between the bearing surfaces.

It is surprising to watch the effect of a few minutes' grinding of a journal in its bearing. We have seen a twenty-horse engine, under full pressure of steam, brought almost to a standstill by the sudden grindings of one of the bearings of a shaft about two inches in diameter. It appeared that the shaft would have twisted off sooner than revolve in the defective bearing.—*Scientific American.*

A NEW MOTOR.—A recent French invention of considerable interest, is an improved motive-power engine, worked by means of atmospheric pressure under the effect of barometric vacuum. By means of two connecting rods, a shaft receives a rotary motion produced by the action of two parallel cylinders. Each cylinder is closed at one end, and communicates with an oscillating cylinder in the form of a U, which may be placed either horizontally or vertically. When it is placed horizontally and filled with mercury, as well as the motive cylinder, the piston is at the end of the cylinder; the oscillating cylinder is then placed in the vertical position, the mercury falls, and the barometric vacuum being produced, the piston pushed by the atmospheric pressure re-enters the fixed cylinder. The oscillating cylinder then again takes a horizontal position, and the mercury re-entering the fixed cylinder, the piston moves in a contrary direction. The second fixed cylinder is so placed that its piston and that of the second oscillating cylinder are the reverse of the cylinder. Counter weights equilibrate the weight of the U-shaped cylinder full of mercury.

TEMPERING CHISELS.—A practical mechanic communicates to the *Scientific American* the following: In hardening and tempering a cold chisel care should be taken to have a gradual shading of temper. If there is a distinct boundary line of temper color between the hard cutting edge and softer shank portion, it will be very apt to break at or near that line. The cutting edge portion of the chisel should be supported by a backing of steel gradually diminishing in hardness; and as with all metal cutting tools that are subjected to heavy strain. Not every workman becomes uniformly successful in this direction, for, in addition to dexterity, it requires a nice perception of degree of heat and of color in order to obtain the best result.

SCIENTIFIC PROGRESS.

The Photophone in Paris.

The photophone appears to be attracting increased attention among the scientists at the French capital. Among the most recently announced discoveries of Prof. Bell in this connection, is the interesting fact that melted sulphur conducts electricity like selenium, but only at temperatures below that at which it thickens and becomes dark and viscid.

The Professor was to have read a paper upon the photophone before the Society of Arts at their meeting on the 1st of the present month (December.) So much interest was manifested in the promised meeting that word was given out that only members could be admitted, and that even they would be required to provide themselves with special tickets issued for the occasion.

Hearing Sounds from the Sun.

The *Comptes rendus* for Nov. 2d informs us that Prof. Bell and M. Janssen have attempted to hear with the photophone the sounds believed to accompany the rapid commotions taking place in the solar photosphere. The experiments were made at the Observatory of Meudon, a selenium cylinder being placed in different parts of an image of the sun some two ft. in diameter. No very conclusive results were obtained, but M. Janssen has further suggested that a sort of concentrated effect might be obtained by passing a number of successive photographs of a sun-spot across a beam of light, the variations of the intensity of the beam producing sounds when they fall upon the sensitive “photophonic pile” of selenium. Further experiments in this direction are still in progress, in the result of which the scientific world is eagerly interested. If success should attend their efforts, it would be one of the most wonderful achievements of science ever accomplished, and in the light of what has already been done, it is perhaps nothing more than may reasonably be expected.

THE ATMOSPHERE OF CELESTIAL BODIES.—M. Jose J. Landeur communicates an interesting paper to *Les Mondes* on the atmosphere of celestial bodies. Whereas previous investigations have given about 250 miles as the furthest result for the height of the earth's atmosphere, M. Landeur places it at not less than 22,000 miles. He corroborates his calculation by showing that the height at which meteoric matter becomes incandescent on approaching the earth is far beyond the distance heretofore assigned to it, and therefore there must be an atmosphere at that greater distance to produce the incandescence. He also accounts for the spectrum of the aurora borealis, showing a marked coincidence with that of the zodiacal light by the theory that since the earth travels in the zodiacal nebulaosity from September to May, the rarefied atmosphere beyond the earth's heavy envelop of air must absorb some of the constituent elements of the zodiacal nebulaosity, and thus these elements make their presence apparent in the spectrum of the aurora, which phenomenon occurs in this rarefied outer envelope. M. Landeur believes also that the difference between the observed acceleration of the moon's mean movement and that obtained by calculation on any of the previously advanced hypotheses, which is very marked, may be wholly explained by the resistance of this nebulaosity in the moon's movement.

GEOLOGICAL MAPS.—It should be widely known, because of evident importance, that at the International geological congress to be held at Bologna, in 1881, a prize will be awarded of 5,000 francs for the best international scale of color and conventional signs for the graphic representation of formation of geological maps and sections. Many of our geologists might go in for the prize, not for its money value, but for the sake of making a certain department of geology intelligible when presented to the eye. The Babel of coloring in geology at present, here and in other countries, is enough to cause a dispersion of those who come to learn, and depart in disgust when they find that a very important means of conveying knowledge is in itself confictory.

THE COURSE OF A LIGHTNING FLASH.—Prof. Tait, of Edinburgh, insists that when people think they see a lightning flash go upward or downward they must be mistaken. The duration of a lightning flash is less than the millionth part of a second, and the eye cannot possibly follow movements of such extraordinary rapidity. The origin of the mistake seems, he says, to be a subjective one, viz., that the central parts of the retina are more sensitive, by practice, than the rest, and therefore that the portion of the flash which is seen directly affects the brain sooner than the rest. Hence a spectator looking toward either end of the flash very naturally fancies that end to be its starting point.

A LADY ENTOMOLOGIST.—Emily A. Smith, a well-known entomologist of Peoria, Illinois, has gone to Leipzig, where, if the university authorities will allow it, she will pursue a general course of zoological work in the new laboratory of Prof. Luckart. This lady was recently elected a member of the Entomological Society of London.

PHOTOGRAPHIC NEBULÆ.—Prof. Henry Draper read an interesting paper on the “Photographing of the Nebulæ in Orion,” to which brief mention was made in these columns last week. In the course of his remarks the Professor said, “The gaseous nebulae are bodies of interest, because they may be regarded as representing an early stage in the genesis of stellar or solar systems. Matter appears to exist in them in a simple form, as indicated by their simple spectrum of three or four lines. It is desirable, therefore, to ascertain what changes occur in the nebulae, and determine, if possible, the laws regulating their internal movements. Drawings by hand have been made of some of the nebulae, and especially of the nebula in Orion, for upwards of 200 years. But drawings are open to the objection that fancy or bias may distort the picture, and it is, therefore, difficult to depend on the result, and to compare the drawing of one man with that of another. To apply photography to depicting the nebula is difficult, because these bodies are very faint, and, of course, owing to the earth's motion and other causes, they seem not to be at rest. They require a large telescope of special construction, and it must be driven by clock-work with the greatest precision. All such difficulties as those arising from refraction, flexure of the telescope tube, slip of loose bearings, atmospheric tremor, wind, irregularities of clock-work, foggy or yellow state of the air, have to be encountered. The photographic exposure needed is only an hour, and a slip or movement of a very small fraction of an inch is easily seen in the photograph when it is subjected to a magnifier. In taking the photographs Prof. Draper used a triple achromatic objective of 11 inches aperture made by Clark & Sons, according to the plan of Mr. Rutherford, for correcting the rays, especially for photography. This telescope was mounted on an equatorial stand and driven by a clock made by Prof. Draper. The photographic plates were bromo-gelatin, and about eight times as sensitive as the wet collodion formerly employed. Having described the photographs, Prof. Draper remarked that a series of photographs taken at different seasons and in different years would make it possible to determine, with some precision, what changes, if any, are taking place in the nebulae.

THE AURORA BOREALIS.—Special attention is being paid to observations of the aurora borealis in the Scandinavian portions of Europe. We have already the results of 839 observations, taken at 132 different stations and on 154 different nights during the seven months of the winter of 1878-79. These observations have been arranged by Herr Tremholt under four heads, as follows: Longitude and latitude of observer; time of year and age of the moon; color, form and altitude of streamers; and lastly, any sound which may have been observed. The deductions from the observations thus far made, in the opinion of Herr Tremholt, lead to the conclusion that the aurora is a local phenomenon, circumscribed by narrow limits, and manifested at inconsiderable distances from the earth's surface. The light is generally white, less often red or green; in high latitudes it not infrequently presents spectral colors, and finally, that the accompaniment of sound is an indisputable fact. Herr Tremholt has devoted his attention to this subject for many years. He is now engaged in making as full and complete a catalogue of these manifestations as is possible. With this object in view, he invites the co-operation of observers everywhere, both upon sea and upon land, to the end that he may thus gather materials for the better elucidation of the interesting phenomena connected with these manifestations.

A NEW SPEAKING MACHINE.—The *Journal of Science*, reports that Herr Faber lately exhibited his new speaking machine before the Physical Society, London. It is designed to imitate mechanically the utterance of the human voice by means of artificial organs of articulation made on the human model, and it is worked by keys like a musical instrument. A hollow made of wood and india-rubber serves for lungs. A small windmill is placed in front of the bellows to give trilling sounds. The larynx is made of a single membrane of hippopotamus hide and india-rubber. A mouth with two lips, a tongue, and an india-rubber nose complete the organs of the apparatus. Fourteen distinct sounds were uttered by it, and by combining these any word in any language can be pronounced. Laughing and whispering were also produced, and the pitch was raised or depressed at pleasure.

IMPORTANT TELEGRAPHIC DISCOVERY.—*Nature* of Nov. 25th says it is announced that the electric cable manufacturing firm, Berthoud, Borel & Co., of Cortaillod, in Neuchâtel, have made a highly important discovery in practical telegraphy. After a long and expensive series of experiments they have succeeded in devising a method of laying cables whereby the inductions of the electric current from one wire to another, although the wires are in juxtaposition, is prevented. This discovery, it is asserted, removes the last obstacle in the way of the widest possible extension of facilities for telephonic communication.

GEOLOGIC PHENOMENA.—To the alteration and metamorphism of rocks by the infiltration of rain and other meteoric waters, M. De Koninck, of the Belgian Academy of Sciences, assigns the cause of many hitherto unexplained phenomena in geology.

MINING SUMMARY.

The Mining Share Market.

Of course the whole attention of the mining stock people has been concentrated on Alta. It went way up and then it went way down; and it is at the latter price just now. When it was going up, there were not many questions as to the reason why; but when it began to fall there began to be inquiries as to why it ever went up. The water brought it down; but what sent it up? Was it a bona fide development, or what? And what is the *real* condition of the mine now? The public charged fraud on the managers. A public meeting was held. The Trustees held a meeting and passed resolutions calling on the Superintendent to explain. The Superintendent then explains in a long letter, and says there is an ore body. He says it may be safely estimated that the body penetrated by the drill

Mining Accidents.

An accident took place in the Bald Mountain mine, Sierra county, the other day, which resulted in the death of one man and the serious injury of four others. A man by the name of Peterson was running the other persons out in a car, when from some cause it jumped the track and caught Peterson between the car and timbers, cutting his arm nearly off. He died in a short time. The other men were not fatally injured. It was a narrow escape for all the party.

John Spohn, an old resident of Downieville, says the *Messenger*, was killed on Monday last, about noon, by falling from the bank of the creek into the bed of the same. He had been living for a great many years in the old log cabin just this side of the grave yard. sun

was engaged in pa
brought to the ravine in

little water. To get down into the ravine he had cut a sort of trail down the steep bank just above the bridge. The theory of his death, judging from appearances, is that he was going down this trail with a load of gravel when he slipped and fell, striking heavily upon a large rock in the bank, about half way down and thence falling upon the sharp rocks at the bottom. The cabin in which the old man lived is the oldest in this section, being built of logs and just high enough for an ordinary sized person to stand erect. It has a mud floor and is altogether the most primitive of habitations. The deceased was, we believe, a native of Pennsylvania, and aged 61 years at the time of his death. It is said that his wife and children in the East, are well off and desired him to return and spend his remaining days in peace and plenty, but he would not go.

FIRE-PROOF ROCK.—Adolph Breh, who has been furnishing our firemen with sandstone,

base of Bald mountain, will return to his old quarters in a day or two, and stack up the hlocks for another summer's demand. He is justified in his project by the word of mining men, who think much of the fire-proof rock will be needed next season. The success of the Atlas run on Dunderberg ores awakes the owners of other furnaces to the fact that there is money in the running of the same on custom ore.

CALAVERAS.

EL DORADO.

SOLD.—Mr. Filippini, we understand, has recently sold his Garden Valley mine to Mr. Scott, of San Francisco, who has awarded a contract to Bell & Graves for doing a certain amount of drifting from the bottom of the old shaft, some 70 ft in depth. They have been drifting to the north, and are now upon a large ledge of fine looking quartz. So we learn from Mr. Heindel, who was up from here yesterday.

tion of the surface. The contractors are making the progress in sluicing. They work 3 shifts of 2 men each, of 8 hours stretch. The contract price is \$186 per ft, they furnish their own tools, powder and caudles, while the owner of the mine does the rest. There were 2 other bids put in for the work, one was \$37 and the other \$30, we believe. The Cornishmen, so far, are making big wages, and should the slate grow no harder they will do well. The pumps work smoothly, it having less than 3 inches of water to keep up, while it is capable of lifting 4 times that quantity. The mine is owned by A. J. and J. C. Chas. is superintendent. The carpenter work, and Messrs. J. H. & J. Taylor are the engineers.

and M. Co. have about completed the hydraulic mining of 15-inch pipes at Greensburg, 10 miles from the mouth of the Colorado river, Muntz and one or two other mines laying on the west slope of American canyon. These mines are located on the well-known Greenwood seasonal belt, and are owned by Eastern capitalists, and are under the management of Messrs Gould & McChillough. When these mines are once open they will afford employment for many persons, and will be of great benefit to the country. F. L. Ballard is also investing Eastern capital at or near the mouth of American canyon, having purchased the Von Bremen and Molly hydraulic mines, and is now fitting them for thorough and energetic working. Messrs Ballard & Gould have also purchased the well-known Sardine river mine, and are now working it under the ordinary method of digging the dirt through a shaft, and discharging it at the east shore, above high water mark. The power mine, at Fraser flat, is now under the management of Mr M. I. Head. This mine is also owned by Eastern parties, and is ready for washing. Work on it will be energetically pushed. The few things needed to develop the great water power of the Colorado river are capital and a large supply of water. The application of both may be considered certain in the

liners during the past week because of the scarcity of water. We notice that some are inclined to censure the

men employed by the ditch owners for negligence on the ditch above. Upon investigation, we find that our friends are entirely wrong in their censures. We see the Placer Herald that the ditches over on the other divide are also slack of water, from the same cause. The snow above is quite deep, the surface frozen, and, the ground being dry, most of the water was absorbed, and consequently the ditches on the divide are slack of water, and the water does not amount to enough for practical purposes. For the company to keep the ditch open from snow and ice above is a little more than they are able to do.

MONO.

BELVIDERE.—*Free Press*, Dec. 17: During last week the west crosscut from the south drift passed through the vein formation and into the hard west country rock. Nothing of value having been encountered in this direction, this work was stopped and work resumed in the south drift. The ledge is showing a marked improvement, about 6 inches on the east wall giving assays of from \$51.31 to \$77.60, chiefly in silver. On the west side of this drift is 2 ft. of low-grade ore, which is showing improvement as the work advances, and from its course will unite with the rich seam of ore on the east wall in a few feet further. When this junction is reached we may look for improvement in the entire vein.

LENT SPLIT.—The excavation for the foundation of the pump-boiler and engine is now completed. It is 76 ft. long, 36 ft. deep, 16 ft. wide, and will be laid in solid masonry, making it impossible for the machine to be secondarily moved from any strain in working the shaft. These works, when completed, will ensure the speedy development of these valuable properties to a depth of from 1,500 to 2,000 ft. At a depth of 600 ft. crosscuts can be run into the Bodie and Mono ground, and the Bodie opened at a depth of 100 ft. below its now lowest levels—a very important consideration.

RED CLOUD.—The Red Cloud is a perfect bee-hive. The carpenters are calling up the pumping engine-room, the masons are covering up the top of the boilers and the machinists are hard at work setting up the 500-horse power, direct acting, compound pumping engine. This is a fine piece of machinery, and it is expected that all will be completed, together with the pumps, and started up by Jan. 1st.

GOODSHAW.—The new hoisting works building of the Goodshaw is again set up, closed in and the roof ready for the timber. In order to strengthen the building, a carpenter shop 14x30 ft. on the south side, and a blacksmith shop of the same size on the north side of the main building, have been built, with the main building's 25 ft. makes these works 53 ft. front by 90 ft. in depth. The foundation for the engine is all complete, and the engine set in place ready for operation as soon as connections with the Bodie are made.

ADRIANA.—The upraise from the 500 level on the ore chimney has made connection with the 400 level. The upraise will be started from the 400 level in a few days and continued on the chimney.

GLYNDALE.—The east drift continues hard, and at a distance of 30 ft. will be discontinued. The machinery and everything in and around the mine are working well.

SPACIALE.—They are stopping on the 100 level. They have now about 125 tons of ore ready to ship to the mill. The mine is sufficiently opened to supply the mill with ore to its full capacity. The mill will be started on the arrival of a steam force-pump, now on the road.

BONIS TUNNEL.—The header is now in 2,130 ft. The rock is very hard, but works well. The tunnel will be continued to the company's east line, 3,000 ft. from the mouth of the tunnel. It is the intention of the company to erect a mill.

CHAMPION.—Work in the north drift, 550 level, is making good progress. The ledge continues to improve, showing a richer character of ore at the face than any yet found.

STANDARD CON.—The Standard Con., after paying 2 dividends for last month, aggregating \$150,000, started off with the first full week last December, with a showing that would seem to indicate a similar if not larger payment for the present month. This company extracted 1,213 tons of ore last week, from which was obtained 4,305 ounces of coarse bullion, and the average pulp assay for the week was \$36.08, a very considerable increase over that of any previous week for many months. The mine also shipped for the week \$92,500.30.

PACIFIC COAST.—The south drift from the east crosscut, 600 level, is in 25 ft. the face being in vein matter assaying from \$17 to \$41.20 per ton, 55% of the metal being silver. A drift was started north on the vein from the crosscut and advanced 6 ft. with the face in ore of fair milling grade and carrying from 60% to 70% of silver.

BOSTON CON.—The north drift, 300 level, has been advanced 7 ft.; total length, 216 ft. The vein has widened to 5 ft. the ore is rich, and in quality, and the thickness of the drift indicates further improvement in width of vein, carrying now about 3 inches of clay on the east wall.

NEVADA.

YOU BET MINES.—*Cor. San Juan Times*, Dec. 18: Since I was over on the ridge there have been several claims started up, and old ones put in workable shape, over here, and no doubt the owners reap handsome returns. This snow coming so soon was unexpected. At You Bet there are only three leading mining companies, viz., Hayward & Co., of Chalk Bluff; John Hussey, of the same gravel range; and at You Bet town or Brown's hill, the English company, which has several claims, and is now working it. They have just filed up a claim at Red Dog, known as the dependence hill, through which the blue lead runs, and which was drifted a few years ago by Mallory & Co., and paid well. At Waloupi this same company has claims which are good, and the Brown's Hill claims are nearly worked out. Brown Bros., who own the claim adjoining the English company's claims, have under consideration whether it will be feasible to bring water from the Little York ridge over Sheep hollow, a distance of 1 mile through heavy iron pipe, to work their claim. It will cost several thousand dollars, but I understand that water can be obtained for 6 cents an inch, which is 1 ft. of water is charged by the South Yuba company. It is the impression of many that it will be a paying investment. E. P. Hubbard, formerly of Columbia Hill, is working his claims on the fine hill by the drifting procedure, and has a good ground, but there is a poor show to obtain water, unless a long flume is built or pipe laid. This ground will pay for the investment, but a poor man can do nothing alone; hence Mr. Hubbard has to drift. Mr. John Hussey has one among the best claims in Little York township. Hunt's hill, the claims of A. G. Turner, are the only ones going to be worked this year, unless Mr. Wood gets his claims in shape, which will make two. Sargent & Jones have expended much toward fitting up their hydraulic claims this fall, and will run both the drift claims and hydraulic. The company's claim is situated on Quaker hill. The Knickerbocker claim, owned by Hottinger & Lindemer, will be run with profit to the owners. They have dug a new ditch from the head of their old one to the Silver Flat canyon, while the old 100 level is 4 ft. water in winter. On Scott's flat there will be 3 claims worked this winter—first, the Jordan claim, then the Hethington & Hartung, and the Wiseman & Co.'s mine. The Silver Flat claim will run, at the upper end of Scott's flat. Ashburn & Co. will rush the debris down on the foothill farmers. Remington Hill mines are reported as paying well. The claims of James Collier are being worked regularly.

SKAHAN'S RANCH.—Thomas Christopher and Joseph Russ, old time friends, made us a brief visit on Monday morning last. These gentlemen, with others, are engaged in running a tunnel, at Skahan's ranch, into the bedrock claims. They are now in nearly 1,500 ft.

Muncie.—*Argonaut*, Dec. 19: The new shaft at the Muncie was connected with the old 100 level on Monday night. It will be sunk 200 ft. more, and levels are to be run at each 100 ft. About 6 months will probably elapse before this work is completed so the mine can be run to its full capacity again. Only 20 men are employed.

MARTIN & MITCHELL'S MINES.—*Nevada City Transcript*, Dec. 21: Martin & Mitchell's Canada Hill mine is in a prosperous condition. The place is a fine one. There are now 150 tons of ore on the dump. The 4-stamp mill, which has been idle recently on account of a lack of water, is again in operation. It crushes 10 tons of

quartz every 24 hours. The owners of this claim also have a promising hydraulic claim in the same vicinity. They will probably begin working it this season.

SARGENT & JACOBS' MIXE.—Sargent & Jacobs' drift mine is steadily improving. The last lot of gravel that was washed paid between \$9 and \$10 a ton. The machinery is run by water power, thus enabling the gravel to be handled at a cost of \$1.50 a ton. The ground in the drifts is getting softer, and on Jan. 1, 1881, the force of men will be increased and the mine worked on a more extensive scale than at any time in its past history. Washing was begun Monday in the company's hydraulic claim in the same vicinity, where about 30 men are employed. There is an abundance of free water now to ensure a profitable season's work in the claim. Sargent & Jacobs expect to have about 100 men at work on their claims soon.

PLACER.

WORK SUSPENDED.—*Dutch Flat Forum*, Dec. 18: The work of running drifts in the Franklin gravel mine has been suspended by order of the Board of Trustees. The drift being run by contract was ordered stopped before it had been completed. For the past 8 months prospect drifts have been run in this mine in different directions from the main shaft for the purpose of finding a pay dirt that would justify drift mining, but none having been struck so far, it was determined by the board to suspend, for a while at least, this claim in on the same gravel lead as other claims that have paid handsomely to drift mine, and it was thought pay dirt for that character of search has been found in the Franklin. But so far the search has been to see something done in the direction of opening up this mine for hydraulic work. It is the expressed opinion of old miners that large pay could be taken out of this mine with proper management, after a good tunnel had been cut to open up a passage for washing.

SIERRA.

FOREST QUEEN.—*Mountain Messenger*, Dec. 18: The owners of the Forest Queen mine have taken out 7 or 8 tons of ore and taken it to Old Bluff to be crushed, to ascertain how much it will pay. They sunk on the ledge a few feet only, but found the rock richer as they went down. It would appear that the tunnel just barely cut the apex of the ledge, and had the tunnel been a few ft. higher it would not have tapped the ledge at all. They are still running the tunnel ahead.

SCALES DISTRICT.—Winter has once more wrapped our little town in its white mantle. The snow still continues to fall, there being about 3 ft. on the ground at present, and by the looks of things we are likely to have as much more before the sun will be able to show his warm and genial face. It is the more, which at this time of the year is doubly welcome. The different mining claims around here are all in readiness for water whenever it starts.

NEVADA.

WASHOE DISTRICT.

AN IMPORTANT CONNECTION.—*Virginia City Enterprise*, Dec. 18: The connection recently made between the California and Ophir mines on the 2300 level is rapidly cooling off both mines at that depth. Before the connection was made, the drifts were intensely hot. It was about as much as men could do to endure the heat in them without doing any work. When the connection was first made, the heat was so intense that the miners were obliged to quit work, and the miners to think for a time that there was a fire some where below. The draft set in motion found gases drawn from every chink and cranny, and the smell of these helped to create the impression that there was a fire some where in the lower regions. All the bad air has passed out. There is a streak of ore on the 2100 level that may now be mined.

UNION CON.—*Hill News*, Dec. 20: During the past week 405 tons of ore have been extracted, and 453 tons have been sent to the mills; assay value, \$32,336. On the 2500 level drill hole No. 3 has been extended 120 ft.; assays, from a trace to 86.

SIERRA NEVADA.—On the 2300 level the incline has been raised 25 ft. During the week 109 tons of ore have been mined, assayed from \$16 to \$111 per ton.

CALIFORNIA.—During the past week \$10 tons of ore have been extracted and sent to the mills; assay value, \$18,250 per ton. On the 2300 level the north drift has been advanced 5 ft. and connected with the south drift from the Ophir.

HALE & NORCROSS.—On the 16th inst. a drill hole was started west from the face of the west crosscut on the 2400 level. After boring through 55 ft. of quartz and porphyry, the bit was broken off the drill. From the point where the bit was lost the distance to the west wall is not less than 120 ft. During the week 34 tons of ore, assaying \$43.75, were extracted from the 2100 level.

MEXICAN.—On the 2500 level the joint Ophir east winze has been sunk and timbered 13 ft. The joint Union Con. upraise has been extended 20 ft.

CON. VIRGINIA.—During the past week 783 tons of ore have been extracted and sent to the mills; assay value, \$30,200 per ton. On the 2300 level the south lateral drift has been advanced 25 ft. Bullion shipped during the week, \$58,335.28.

OPHIR.—On the 2500 level the joint Mexican east winze has been sunk and timbered 13 ft.; the joint Mexican west crosscut extended 25 ft.; joint California upraise extended 20 ft. On the 2300 level the California east crosscut has been extended 40 ft.

OVERMAN.—Have made fair progress opening station in winze at a point 375 ft. below 1900 level. No work done in incline upraise during the past week. Forman shaft has been sunk and timbered 20 ft.; total depth, 1,575 ft.

UTAH.—During the past week the east drift on the 1950 level has been extended 21 ft. The east drift on the 1950 level has been extended 21 ft. There has been no change of ground worthy of note.

C. & C. SHAFT.—The shaft has been sunk and timbered 4 ft.; total depth below the 2300 level, 179 ft. We are preparing to run the diamond drill down to explore the ground for water.

CALIFORNIA.—Pumps have run an average of 133 hours per day, consuming 6 cords of wood per day. Forman shaft has been sunk and timbered 20 ft.; total depth, 1,575 ft.

ORIGINAL KEYSTONE.—The shaft is making good progress, being down about 200 ft. The bottom of the shaft is in good blasting ground, which is full of small seams of quartz.

CON. IMPERIAL.—Have done very little work last week except pumping water. The 2000 level is now free of water, and we are engaged in cleaning out the drifts on this level.

UNION SHAFT.—Taking up the water at the bottom of the shaft, cutting out tail-pit at the 1600 level, a hob-pit at the 2200 level and casing timbers at the 2400 station.

SAVAGE.—The force was engaged in repairing shaft, driving level drift, and in work upon stations and upraise in the lower part of the mine.

C. N. S. SHAFT.—The 2 lower sections of the hydraulic pipe is in place and secured. Are now waiting for material from the foundry in San Francisco.

POTOMAC.—Drift run 91 ft. No material change in the formation of ground since last week.

O. & C. & B. SHAFT.—Shaft sunk 30 ft.; total depth, 1,355 ft.

CENTRAL DISTRICT.

AT WORK.—*Silver State*, Dec. 15: S. W. Hammond, of Central district, is in town. He says everybody in the camp is at work, and several of the miners are taking out some small streaks of 40 to 60 ft. in length, and are giving the camp and give it a lively appearance. Deer are seen in the vicinity frequently, and the boys devote some of their spare time to hunting them.

EGAN CANYON DISTRICT.

CROSSCUTTING.—*Ward Reflex*, Dec. 18: The tunnel of the San Jose company (formerly Stoptoe & Social), at Egan Canyon, which was run a number of years ago by Gen. Rosecrans, is being crosscut in several places. One seam of ore on the right side of the tunnel has widened to over 2 ft. in places, and from it go \$100 in silver and over \$700 in gold. Eighteen men are employed in the tunnel, all crosscutting.

EUREKA DISTRICT.

A SUCCESS.—*Eureka Sentinel*, Dec. 20: The Atlas furnace has now been running about 10 days, and during that time has never had a stoppage of any kind, which is rather an unusual thing for the starting up of a new furnace. It is making an average of about 6 tons of bullion per day, and Mr. Dowlen, who has charge of the furnace, is well pleased with the financial outlook of the business.

PARROT.—A cable, which had been used at the Richmond holding works for mining ore, parted yesterday as the cage was coming up with a carload of ore on board. The "safest" halted the concern in a second, and no damage was done.

OSCEOLA DISTRICT.

PLACER GROUND.—*Ward Reflex*, Dec. 18: The placer ground owned by Hampton & Godby, at Osceola, is being vigorously prospected under the supervision of St. Pierre, and developments have been made that will bring water into that camp next year without fail. He has sunk what are known as the Treasure Shaft, which prove beyond a doubt that they have a bank of auriferous earth 273 ft. thick. No. 1 was sunk 103 ft., and from this point a drift was run 6 ft. and a shaft sunk from the end of the drift 63 ft. when another shaft of 6 ft. was run, from which they sunk 43 ft. from the bottom of the first drift was run 24 ft., which struck bedrock. They found colors from the grass roots to the bottom.

RUBY HILL DISTRICT.

IRKMA.—*Ruby Hill News*, Dec. 18: The Wales' new machinery will arrive at the mine next Tuesday. Yesterday the Jackson shaft down, throwing 18 men out of employment. Oliver Dean, of the Zulu mine, who was formerly employed in the K K, will soon depart for the Black Hills. The Zulu shaft is down 100 ft. A drift has been run west 20 ft., which has shown an averaging \$150 per ton. Tom Werry and other parties are doing the assessment work on the Central Hill mine. The shaft is down 10 ft., all in good ore. Yesterday a contract was let at the Albion mine to sink an important winze. Just now this mine is looking well. At the bottom of the shaft a station has been cut and a crosscut started to the southeast.

SILVER CANYON DISTRICT.

RRARY TO RUN.—*Ward Reflex*, Dec. 18: Dr. L. B. Brooks and T. C. Poujade came over from Silver Canyon Thursday. The Doctor reports that the mill was ready to run when he left. He came on business requiring his personal attention, and will return in a day or two.

TUSCARORA DISTRICT.

PROMISING.—*Eureka Sentinel*, Dec. 16: Private letters from Tuscarora speak most encouragingly of the prospects of the camp. The mines are represented as showing splendidly, and the business men are all sanguine of the future. For some time Tuscarora is one of the best and most productive districts in the State.

UNION DISTRICT.

ORE.—*Eureka Sentinel*, Dec. 19: The Mineral Hill and Union District miners are still sending ore down the road for treatment. The drifts are showing several streaks of ore in from that section, and more is to follow. The fact is settled that there will be a furnace in Union district early next spring, if not before.

WARD DISTRICT.

PROGRESS.—*Ward Reflex*, Dec. 18: Since the Main tunnel was cut down on the 20th of last month the progress made will average about 7 ft. a day. The crosscut to the south is in about 230 ft., leaving 120 ft. yet to run before the old Clay chamber is reached. A few little streaks and bunches were encountered Sunday last that could be called ore.

ARIZONA.

PIONEER.—*Globe Chronicle*, Dec. 16: Mr. O. Scott has been doing some work on this mine, and has opened out quite a body of rich ore. The bottom of the main shaft has been sunk to 70 ft. (which is below permanent water level) upon a 24-ft. streak of fine sulphureous ore, and the crosscut is run 16 ft. through the ledge is low grade ore, with no water.

GRANT REPUBLIC.—Work on this mine is showing quite a body of ore. A drift on the 60 level is in 10 ft. through milling ore, which has a rich streak in the center 13 inches wide. There are a number of mines in the same neighborhood, such as the Pioaer, Arizona and others, which lay under the disadvantage of lack of capital for development.

THE LITTLE BLESSING.—This claim, near Miami, was recently discovered by Messrs. Anderson & Nupton, and has an excellent showing of ore on the surface. They have put men at work on the claim.

THE TRER.—A new shaft has been commenced on the Turk, at the extreme southwest end of the claim, where there is an excellent showing of good ore on the surface. It carries a quantity of born silver. The ledge crops over the surface, and varies from 4 to 6 inches in thickness.

ROWAN.—This claim, since the recent strike of gold ore made upon it, has been, by development, made into a paying mine. The main shaft is down 35 ft., and shows more or less high grade ore, while the streak of rich gold ore in the center will average from 1 to 3 ft. wide. Fred Medler extracted a ton of this ore last week which produced 50 ounces of gold. Then, from the surface and dumps at least 150 tons, which will yield over \$100 per ton.

CALIFORNIA.—This mine is opening out with great promise, as every opening shows milling ore. The southwest drift has been extended 60 ft. The road to the Champion mill is almost completed, and we understand it will start up on California ore this week, there being 150 tons on the dumps.

AMERICA.—This mine forms one of the groups situated near the East Fork of the Verde river. Upon the America the ledge has been cut in over 150 ft. deep by a creek, and shows from within 12 ft. of the top right to the bottom 14 ft. of solid ore between the walls. An open cut has been run in upon it, and samples worked in assays have yielded from \$25 to \$30 per ton in free gold.

ZULU.—This mine, which is owned by a small group, and has also a large ledge, which shows on the surface 3 ft. wide. A shaft has been sunk 65 ft. on a rich streak of free gold ore about 24 ft. thick. Careful assays lead the owners to believe that this ore will average \$175 per ton in gold.

EXCURSION.—This mine is on the Tonto gold belt, and is being actively developed by the New York company to whom it belongs. The main shaft is now sunk 120 ft., and was put down to 100 ft. and is being driven on as to put the property in good shape to keep a mill going. The vein will run about 4 ft. wide, and the ore just taken out will average \$30 per ton in "free gold."

GOLDEN WONDER.—This is one of the prominent Tonto gold mines which is assisting to bring that section into notice. The main shaft is 65 ft. deep, and has been sunk on a rich ore streak 30 inches wide, 40 ft. in length, and is claimed, will yield in assays \$100 per ton in gold. There have been 50 tons of average ore worked, which returned \$64 per ton.

HOUSE & ROUSE MINES.—The mine known by this name consists of 4 distinct claims, which have been laid out so as to cover the large number of veins that occur in the portion of the Tonto gold belt from which the gold ore is, and are 25 in number, generally running parallel, although there are a few with cross courses. In size they are from 1 to 4 ft. wide, and show very distinct and well defined. A shaft is sunk 45 ft. deep on the largest vein, which is 4 ft. wide, and all good milling ore. A tunnel has also been run 142 ft. to crosscut the veins, and has already gone through 4 of them. This carry high grade ore.

LAST CHANCE.—This mine is about 3 miles east of Tonto in Delahay basin, and comprises 2 full claims on the same ledge, which are distinguished by distinct ore croppings

nearly the whole 3,000 ft. The main shaft is 65 ft. deep in good ore, and 8 prospect shafts from 10 to 15 ft. deep also show the same quality of good milling ore, of which there is over 100 tons on the dumps that will average \$70 per ton in gold. Near the mine is a good mill site, with water sufficient for a 10 stamp mill.

GOWAN.—This adjoins the Zulu, and has the same large ledge of free gold ore, which an open cut shows to be about 7 ft. wide. The ore passes out well, and there is a considerable quantity which will pay well by assays. The owners of the America group have also several claims in the vicinity upon smaller veins, which carry milling ore. They have been prospected by a number of cuts and openings, which all show more or less good ore, some of it being very high grade and certain to yield well in the 6 stamps that have just been constructed by Mr. Samuels and his partners. These poor men's mills are to be driven by a 30-ft. over-shut water wheel, a ditch for which has been made, taking the water from the East Verde.

COLORADO.

ROBERT TUNNEL.—*Georgetown Courier*, Dec. 16: The Robert tunnel, Cascade district, owned by C. E. Bigelow, T. E. Schwartz and Harry Meers, is now in about 75 ft., and it is expected that the Exchange and Blouline lodes, for which the tunnel is being driven, will be intersected within the next 25 ft. The lodes form a junction at the point the tunnel will cut them, and at the surface show a large and promising outcrop.

ONEA.—A body of very rich ore is being opened in the Shively mine, on the 155 level of the shaft.

DUNDAS.—Mr. Andrew Stevens, the new superintendent of the Dundasberg, states that everything is progressing satisfactorily at the mine, with the exception of a scarcity of fire wood just at present, which prevents the running of the concentrating mill more than 10 hours per day.

JOHN ELEPHANT.—Since our last issue a half dozen more lessees have been out to work on the Red Elephant property, in the Hoca Nest and at the Schwarz and Hogan shafts on the White, and the average grade of the ore sold has been better than at any previous time since Mr. Fish has had control. Ore shipments have been retarded of late on account of the frozen condition of the road down the mountain side.

MUSCOVITE.—The Muscovite lode, in Cascade district, better known as Denise O'Fallon's lode, was sold last Friday to R. Harry Worthington, of the Deuver *Inter-Ocean*. The purchaser has been working the lode during the past 2 months, and has become satisfied of its value.

SILVER KING.—Work is going steadily forward on the Silver Ring lode, Cascade district, at driving the side on the vein ahead. The lode was found to be faulted, which made crosscutting necessary, and it was only recently that the ore vein was found again.

STRIKE.—Geo. Marsh and Wm. Haywood are the ones who are in luck this time. They are the owners of the *Etina* lode, which is situated about half way up Orifith mountain, near the Comet trail, and recently they let a contract to drive an adit on the vein, which, at a distance of 100 ft. from its mouth, has exposed a vein of decomposed ore from 3 to 6 inches thick, that is worth from \$500 to \$800 per ton.

MONTANA.

STRIKE IN THE BELLS.—*Butte Miner*, Dec. 14: It has been found that the entire mass of matter between the 2 wells carries metal in greater or less proportions, and that at least 30 ft. of the distance the ore carries a uniform assay value of 25% copper, with several rich streaks, assaying high in silver. It is from these streaks that so much of the rich silver-copper ore shipped to the East during the past summer has been produced. The low-grade copper ore, which carries 25% copper and a few dollars in silver per ton, is not being extracted. But something better is now being extracted, the attention of the owners of the property is known that there are ore of the Bell which are the richest produced in the east. After the deposits between the middle and east shafts had been, to a great extent, worked out, and after further sinking had developed the presence of some remarkably rich silver-copper ore in the 160 level, little attention was paid to the work of prospecting nearer the surface. Some time ago, however, it was decided to extend in an easterly direction the 60 level, which had previously been running only west. The old shoot was followed for about 50 ft., yielding some fine free ore, but at this point the rich ore played out, and little else than worthless ledge matter was visible in the face of the drift. Progress was continued, however, and, after passing through 20 ft. of barren rock, another and far richer shoot was discovered last Sunday. The ore is fabulously rich in this district. Yet remarkable as it may seem, the Bell is now producing ore from the 60 level, high above water, many pieces of which are literally incrustated with silver, beautifully white and pure. Some 25 tons have been taken out.

MOUNTAIN BOY.—Some delay in sinking has been occasioned during the past few days by the removal of timbers from the shaft, but these were delivered on Tuesday, and yesterday 3 shifts of men were employed to sink the shaft, which will now be put down with all possible expedition.

MOUNTAIN BOY.—At the bottom of the incline, at a depth of 210 ft. the east and west drifts have been extended nearly to a level with the 160 level. The company has supposed that free silver is found only in combination with bases. At least native silver above the water line has occurred very rarely in this district. Yet remarkable as it may seem, the Bell is now producing ore from the 60 level, high above water, many pieces of which are literally incrustated with silver, beautifully white and pure. Some 25 tons have been taken out.

MOUNTAIN BOY.—Some delay in sinking has been occasioned during the past few days by the removal of timbers from the shaft, but these were delivered on Tuesday, and yesterday 3 shifts of men were employed to sink the shaft, which will now be put down with all possible expedition.

MOUNTAIN BOY.—At the bottom of the incline, at a depth of 210 ft. the east and west drifts have been extended nearly to a level with the 160 level. The company has supposed that free silver is found only in combination with bases. At least native silver above the water line has occurred very rarely in this district. Yet remarkable as it may seem, the Bell is now producing ore from the 60 level, high above water, many pieces of which are literally incrustated with silver, beautifully white and pure. Some 25 tons have been taken out.

MAONA CHARTA.—It is now reasonably certain that popular expectation in regard to the magnitude, permanence and richness of this ledge will be fulfilled. From the bottom of the main shaft the crosscuts have been driven ahead with the 160 level, and the ore has been encountered and penetrated a large body of ore. The north crosscut has struck the vein which the shaft cut at a depth of 65 ft., and the one running south has uncovered the main ledge on which the Alice and Moulton have been developed.

NEW MEXICO.

BOBTAIL.—*News and Press*, Dec. 9: Work has been progressing on the Bobtail, in the Cimarronito camp, during the past 2 or 3 weeks. There is now an open cut in about 40 ft. crossing the vein, and showing considerable ore, about 200 tons of which is now on the dump. The ore is iron and copper, carrying silver and gold, and in places is very richly decomposed, showing gold. Great improvement is reported during the past week. Robert Ball is the principal owner.

REBEL CHIEF MINE.—We are in receipt of some specimens of very fine gold ore from the Rebel Chief mine, on Uto creek, about 20 miles from Cimarron. This valuable property was discovered some years ago, and was worked to some extent on the surface by the company. Since then it has been worked underground, being about 30 ft. The ore then extracted was treated in assays with considerable profit, but owing to the distance from communication, and the expense of transportation, work was stopped and not resumed until the property was purchased by the present owners, the Cimarron mining company, of New York, I. W. England, of the New York & Arizona Press, and J. W. England, of the New York & Arizona Press. The company has a tunnel 140 ft. long and tapped the veins (for there are 2) at the depth of 120 ft. At the point of intersection an upraise was made to the bottom of an old shaft, and this affords excellent ventilation. A drift from the tunnel has been driven west 40 ft. on the lower vein, and is in pay ore in cars.

Rebel Creek District.

From a recent number of the *Silver State* we glean the following facts about this district:

Until quite recently little attention was paid to quartz mining in the northern part of this county. The country, in consequence of the nutritious grasses indigenous to the mountains and valleys, was, with the exception of Paradise valley, devoted almost exclusively to stock raising. Mounted vaqueros galloped their broncos over the plains and traversed the mountains, but as they were on the lookout for cattle, they paid no attention to quartz. Since the discovery of mines in this Paradise mountains, more attention was paid to quartz leads by the cattle men and station keepers along the Idaho road, and among the first discoveries made by them was

The Ohio Mine.

This ledge proved to be rich from the grass roots down as far as prospected, and several carloads of the ore shipped to Salt Lake for reduction left the shippers a handsome profit. This resulted in the formation of a new mining district, which embraces the mountains from Willow Creek station north, along Rebel and Willow creeks. These mountains were prospected to some extent, and several quartz leads were discovered and located in the hills along the creeks. The principal locations, besides the Ohio, which is called the representative mine of the district, are the Emma, Silver Wave, Paymaster, Iowa Con., and Ethan Allen.

This Emma was discovered by A. H. Ruse. It is situated about a mile and a half north of the Ohio, and is prospected to a considerable extent. The ledge is uncovered a distance of 1,000 ft. on the surface, and is developed by two tunnels. The upper tunnel is in on the ledge 55 ft., and the lower tunnel, 100 ft. below, is in 35 ft. The ledge is about six ft. wide, and well defined. It is enclosed in gray porphyry on the footwall, and by limestone and slate on the hanging wall. The ore is free milling, and assays from \$25 to \$104 per ton in gold, and from \$185 to \$351 in silver.

The Silver Wave is about a mile east of the Emma, and is owned by H. H. McColly and Paul Sieric. A tunnel 80 ft. long is run on the lead, which carries considerable ore, and promises to be a good mine.

The Paymaster is about a mile southeast of the Silver Wave. The vein is opened by a tunnel 50 ft. long, and the character of the ore is similar to that of the Ohio. It is owned by McColly, Edwards & Co.

The Iowa Con. is owned by Ben. Harris and the Bernard brothers. The ore is principally chloride and horn silver.

The Ethan Allen is about seven miles from the above mentioned mines on Willow creek. The character of the ore is different from that in the other mines, as it carries a high percentage of galena, and will have to be smelted.

Facilities for Mills.

Willow creek is situated on the Idaho road about 54 miles north of Winnemucca. There is water enough in the stream to run a 10-stamp mill by water power at all seasons of the year. There are fine groves of cottonwood on the stream, and at its mouth are thousands of acres of the finest sage-brush in the State. This brush, which is almost as large as ordinary cedar trees, furnishes cheap and good fuel for steam mills, for which purpose it is extensively used in this and other parts of Nevada. The district is a very inviting one for capitalists; the mines are all in the hands of the original owners, who are disposed to give investors a fair show.

ARIZONA.—The following is from the *Bodie Standard-News*: Ned Reddy, who left Bodie about a month since for the fabulous gold fields of the sunny South, arrived in Bodie yesterday. Mr. Reddy, in addition to visiting outside camps, made a specialty of the grand central point of attraction—Tombstone. This town is situated 23 miles from Benson, a station on the Southern Pacific railroad, a good line of stages connecting the two points. The town contains about 4,000 inhabitants. The resources of the town are the Contention mine, employing 12 men, and having a 30-stamp mill; the Toughnut with 17 men, and the Grand Central with 25 men. Thousands of men are broke, with no prospects for work. Business of all kinds is generally overdone. The games will give an idea of the prospects. There are seven ten-cent check faro games doing a starvation business. Arizona is about three years ahead of its population. At the expiration of that time it may be a good country to locate in, but at present the great mass will do well to give it a wide berth. For my part, Bodie suite me. Of all the old-timers I have met, not one but wanted to get back.

UTAH MINES.—The *Bodie Standard-News* recently, in speaking of miners leaving that camp for Utah, says: Before starting they received very encouraging news from the southern part of the Territory. Utah is a wonderful section of country, and her mineral deposits are almost inexhaustible. She is cursed with Mormonism at present, but the day is not far distant when she will rival the most favored sections of the coast. During the past year she has made rapid headway in mining, and much money has been invested. The chances of making a raise in Utah are more favorable than in Arizona.

Last month the Utah Southern road received 2,921,763 lbs. of bullion and 3,778,357 lbs. of ore.

Yosemite in Winter.

One of the most remarkable canyons connected with the Yosemite valley is that leading up to the foot of the Vernal falls. There are two ways of reaching the head of these falls—the one by an easy ascent along the ridge to the right of the canyon, and the other, very difficult, by following through the canyon itself, the walls of which, at one point, completely overhang the trail. On arriving at the foot of the falls, the visitor is met by a perpendicular wall of rock, up which not even a cat could climb without artificial aid. To enable him to reach the summit, a series of rough ladders has been erected, as shown in the engraving. Even by such aid, the ascent is not only difficult, but dangerous. It was here that Campi, the well known restaurant keeper of this city, lost his

The Tree Planting Season.

It is timely to put in the usual word about tree planting. It may be believed that there is no special exhortation needed toward the planting of fruit trees, for the State is already wide awake to the desirability of increasing our production of certain fruits. The experience of the past season has given orchard planting a sharp impulse, and that branch of the subject may be safely left to itself for the present at least.

The planting of trees for ornament, shade and timber is urged as often as the rains come and yet there is still room and occasion for repeating the exhortation. The beautifying of our town streets and county highways, the wise planting in dooryards and around stock yards, and the covering of vacant lands unfit for tillage with growths of profitable timber—

VERNAL FALLS, YOSEMITE VALLEY.

life, a few years ago, by a misstep, which precipitated him some 60 ft. upon the rocks near the foot of the narrow and rickety ladder seen upon the left, near the bottom of the engraving. That ladder is not used now; the more substantial one near by, with railings upon both sides, having been substituted. The view here given was taken in winter, as will be noticed by the icy covering by which the rocks are mostly concealed, and the immense icicles hanging down over the short gallery connecting the two ladder-ways. The engraving is from a photograph by George Fiske, who has his headquarters at Townsend's candy factory, Palace hotel, Market St.

MEXICO.—A miner recently returned from Guaymas says: Here I met Boh. Hatch, an Inyo county man, who had just returned from Guaymas. He reports that country the worst in the lot—no money, no work, and nothing to make it out of. They are principally Mexicans, and all are waiting for the railroad, believing they will make fortunes out of it.

THE Brown's valley mines, Yuba county, have been incorporated under the name of the "Solo Mill and Mining Co.," with a capital of \$500,000, in 50,000 shares of \$10 each, and it is understood that a part of this stock will be placed on the market.

all these should be considered, discussed and acted upon. The State is full of instances of rapid growth of young timber set for wind-breaks on the plains or in patches on the hills to warrant investment in these lines of planting. In the long dry summer the green growths of eucalyptus here and there upon the Contra Costa hills from Berkeley south to Haywards have shone out from their brown and barren surroundings, seeming to command the hill owners to fill the gaps until the whole hill surface should be covered with trees. But though you urge it upon esthetic grounds or clearly demonstrate its success as an investment, still the hill tops remain bare. It is gratifying, however, to note little marks of progress, and one can hope that soon the spirit of tree planting will wider prevail. The great regret must be the time which is being lost. While one hesitates the tree would grow, and before the hesitating man makes up his mind the little plants on his neighbors' lands have become forests.

We trust that the general prosperity of the last year may induce many to make some outlay in the direction of filling the waste places with beautiful timber trees. There is promise of abundant moisture this year and the time could not be better for securing a good start with well-set trees. It would be well if every seedling now lamenting its cramped space in

the boxes of the nurserymen should find room on the hills or in the valleys to put forth leaf and branch and rise to its natural beauty and utility. Let the trees have a chance. They will make glad your eye and carry their benefits to your children's children.

El Dorado Canyon.

A correspondent of the *Silver Reef Miner* writes to that journal as follows, in answer to many inquiries relative to El Dorado Canyon district: Situated in Lincoln county, Nevada, in the range of mountains running parallel with the Colorado river, it extends to the river, a distance of 12 miles. On the north side of the canyon, about midway between the Colorado and the summit of the mountain, is the Southwestern company's mines. This company has a 15-stamp mill, with White & Howell chloridizing furnace, to which they haul their ore at an expense of \$3.25 per ton. This ore, or vein matter, is white spar. R. G. Knox is general manager, and Frank Loughrey, assayer for this company. Almost opposite, on the south side of the canyon, the new district begins, and extends southerly about three miles and westerly about six miles. From Prof. Jennings, who has made a careful study of this district, I learn that the formation is syenite, the vein-filling quartz carrying a chloride.

The most promising mines are the January, Lone Star, Silver Legion, Silver Eagle, Morning Star, Champion, Mohasco, O. K., Gift, Stand-by, with several others on which some work is being done. The first locations were made in this district last January, but little work has been done, as the discoverers could not dispose of the ore extracted. Now, however, that a custom mill is on the way, more work will probably be done in the next four months than has been done since the discovery of the district. There is ready for shipment to the new mill 300 tons or more of ore, the estimated value of which is \$200 per ton, and much more will be on the dumps before the mill is ready to start up. Messrs. Fife, Goodhue & Co. are the owners of this mill, and are pushing it to completion.

The difficulty in obtaining water has delayed prospecting. When this distance, seven to nine miles, to pack water, with the thermometer averaging 114, and the want of everything necessary to prosecute work is considered, it is plain why development has not been more rapid. With the new mill, a store at which to supply from, and the warm season over, we can look to the next six months for developments that will make El Dorado a mining camp in production; as yet it has only been such in name.

Arizona's Mineral Deposits.

We think there are powerful geological reasons why Arizona is the country par excellence of great mineral deposits. It is generally admitted by geologists and scientists who have studied the subject that the occurrence of large mineral fissures, or mineral fissures in large numbers, is associated almost invariably with mountain ranges, and the situation of the principal gold and silver mines in the world bear this out. For example, the Andes in South America, the Sierra Madre in Mexico, the Rocky mountains and Sierra Nevada in the United States, is where the eyes of the world are looking for its future supplies of the precious metals. The greatest mountain ranges on the North American Continent and the upheavals and subsidences which caused them, center in the middle and southeastern portions of our Territory. This can be plainly seen by any one examining a good map of the Western Hemisphere. The great Andes range traverses South America, and with occasional breaks comes up through Mexico into Southeastern Arizona, where it divides into the Sierra Nevada on the west, Mogollon and Wasatch ranges in the center, and the Rocky mountains on the east. Now, the point of division is Arizona, where the prophetic eye of Baron von Humboldt saw the indications and foretold the wonderful deposits of the precious metals, which are now opening out, although as yet we are but scratching the surface and our output of bullion comparatively small to what it will be when we really get down to, say, 1,000 ft. from the surface. Then it will be found that our lodes have solid bodies of rich milling ores which can be opened out and made to yield quantities of bullion equal, and possibly superior, to anything hitherto produced on the globe. —*Globe Chronicle*.

UTILIZING OLD WASTE DUMPS.—The *Silver State* says: Messrs. Harris & Bose, practical men, who thoroughly understand the leaching process, have made arrangements with the owner of the Gem mine, 18 miles south of town, in Sierra district, to work the mine and the ore on the dump. They are now erecting leaching works at the mine, and they intend to lift the dump and get all the rich chloride ores which it contains, to work. Mr. Harris, who has visited several mines in this county, says there are thousands of dollars in many of the dumps which can be saved by the leaching process. This is particularly the case where there are chloride ores, as they can be leached without roasting. He says the cost of sorting the dumps and separating the silver does not exceed \$4 per ton, where the ore can be treated without roasting. They think they will erect a small mill for crushing ore at the Gem next spring.

THE ENGINEER.

Unsinkable Ships.

A party of gentlemen interested in steam navigation lately met at North Woolwich to inspect a steam launch built on Mr. James Long's unsinkable system. The principle consists in attaching to the sides of the hull of a vessel a series of flat air-tight metallic cylinders or drums, the inner heads of which are built into and form part of the framing and inner skin of the vessel. These drums project on either side of the ship and are cased in, the under sides of the casing normally resting upon the surface of the water and becoming slightly immersed under a load. This results in a light draft with great freeboard, and it is claimed that a greater stability under canvas and a higher rate of speed under steam or sail are thereby attained, besides the advantages of greater cargo capacity, economy in construction, and, above all, unsinkableness, however damaged by collision or otherwise. The launch in question, which is only experimental, is steel built, 37 ft. in length, 6 ft. in depth, and 5 ft. 8 inches beam internally. She has 7 cylinders fitted on each side, each cylinder being 3 ft. 6 inches in diameter and 1 ft. 8 inches deep, and which give her a width of nearly 9 ft. over all. She draws 2 ft. of water without her load, and has a freeboard of 4 ft. A short run was made with the vessel, a fair rate of speed being attained, while its unsinkable character and other points were demonstrated by Mr. Long by means of a model vessel.

INFLUENCE OF MISSISSIPPI IMPROVEMENTS.—The effect of the jetty improvements at the mouth of the Mississippi river, in extending the commerce of the Mississippi valley, is already very great. Since the beginning of this year, St. Louis has shipped to Europe, by way of New Orleans, twice as much grain as passed out of the country by that route during the last 10 months of last year. The shipments down the river would be still greater were it not for the lack of barges to carry the grain. It is said that a fleet of boats are being built to supply the want. In regard to the improvements in progress on the Upper Mississippi, it is reported that the commission having them in charge has finished the examination of that portion of the river between St. Paul and St. Louis, a distance of 700 miles. Great improvement was found in the channel, especially for low water navigation, the result of the improvement works in process of execution by the corps of engineers. These works consist of low wing-dams of brush and stone, projecting from the shore for the purpose of narrowing the water way, supplemented by a brush and stone revetment of the opposite bank and elsewhere if necessary wherever the contraction produces caving.

AN ENGLISH ENGINEER ON AMERICAN LOCOMOTIVES.—Mr. R. M. Brereton, C. E., writing on this subject, says: "I argue that the greater duty done by the American motor is due to the better design and the better system of working the locomotives. The American builder excels in the system of framing and counter-balancing, and in the designs of crank axles, etc., so that the engine may run remarkably easy and without jar round sharp curves, and work not only the light roads, but also diminish the wear and tear on the solid roads, and at the same time increase the effective tractive force. The English engine is a very heavy affair, and in running it not only wears and tears itself very rapidly, but also the roadway, and it greatly, by its unsteadiness and jar, fatigues the drivers and firemen. I have ridden hundreds of miles on engines in India, in England, in France, and in the United States, and I have always found the American engine most easy and comfortable, but I never did the English or the Continental engines. It is almost impossible to give these engines their full hauling power, simply because the greater portion of the weight cannot be thrown on the driving wheels."

A LONG BRIDGE.—A large undertaking has recently been completed in Russia, in the shape of a long bridge over the Volga, on the Syoran and Orenberg railway, connecting the cities of Syoran, in the government of Simbirsk, with that of Samara. The width of the river is nearly a mile, and as it is liable to the occurrence of heavy spring floods, the piers (of which there are 14 altogether) had to be built 100 ft. above mean water level, the depth of the river being more than 50 ft. The girders, 364 ft. long and 20 ft. wide, were all riveted and put together on the right bank of the river, and then floated to their position. The whole cost of the bridge was 7,000,000 silver rubles, and it is worthy of mention that it was completed without loss of life or accident of importance.

TEST OF THE MISSISSIPPI OUTLET.—The Dominion line steamer *Montreal*, bound for Liverpool, passed the jetty November 17th, with the largest cargo ever taken from New Orleans. It consisted of 6,659 bales of cotton, 42,658 bushels of corn, and 2,000 packages of miscellaneous cargo, the total being equivalent in bulk to 9,565 bales of cotton.

TUNNELING THE SIMPLON.—One hundred and thirty French deputies have signed M. Renaul's proposition for a grant of 50,000,000 francs for the construction of a tunnel through the Simplon mountain. It is stated that Italy and Switzerland have promised subventions.

USEFUL INFORMATION.

DRY ROT IN HOUSES.—At the annual meeting of the Cryptogamic Society of Scotland, commenced in Glasgow recently, a paper by Mr. Young, architect, of Perth, was read by the Secretary, Dr. Buchanan White, on "Dry Rot Fungus in Houses, and the Best Means of Eradicating it." The following were the conclusions at which Mr. Young arrived: 1. That wood is necessary for the root or first production of the fungus. 2. That the wood, after a time, gets exhausted of its nourishment for the fungus, and when this is the case the plant attached to it dies. 3. That if it has wood for its root its branches will luxuriate even in the heart of a well-built dry rubbish wall; but when the wood at the root is exhausted it dies in the wall. 4. That where the conditions are favorable, free ventilation is not against its growth; on the contrary, a draft aids in dispersing its spores. 5. The cure is to eradicate it as far as possible by burning the soil, applying a flame to the walls, and removing every particle of wood from its locality, and substituting stone, iron, or cement. 6. That upon perfectly dry and healthy wood it would not readily take root, but if it gets good root in dampish wood, its growth will ramify over dry fresh wood and prey upon and destroy its tissues, thus ruining it for all structural purposes.

LOSSES BY FIRE.—It is estimated that the total annual losses of insured property by fire, throughout the world, average nearly \$200,000,000. Add to this the annual destruction of uninsured property, and we should probably have a total amounting to quite double these figures. How great the loss, how severe the tax upon the productive industry of mankind, this enormous yearly destruction amounts to, will come home to the minds of most readers more directly if we call attention to the fact that it just about equals the value of our total wheat crop during a year of good yield. And it is a direct tax upon productive industry everywhere, because, although here and there a nominal loser, fully insured, has only made what is sometimes called "a good sale" to the companies holding his risk, this is only a way of apportioning the loss whereby the community at large become the sufferers. Thus it is that we find all ably-managed insurance companies earnestly endeavoring to make it plain to the public how fires should be guarded against, or most effectually localized and controlled when once started.

SAVING ALKALI IN PAPER MANUFACTURE.—T. L. Snyder, of Phoenixville, Pa., is now putting in an alkali or soda ash reclaimer for one of the paper companies at Turner's falls. At present, the alkali, after performing its office in the digester, runs off into the river a sheer waste. The entire process is as follows: The alkali having reduced the wood in the digester, is cleared from the pulp by water process; the mixture, containing alkali holding the soda ash in solution, certain vegetable matter retained from the wood and the water. The whole goes back to the reclaimer, where the vegetable matter is burned out and the water evaporated. Some more soda ash is added and the alkali goes again to the digester to again produce pulp. Thus an endless round of duty is continued. About 85% of the soda is saved. It costs five mills per lb. to reclaim it, and it is worth two cents a lb. This establishment at Turner's falls contains two reclaimers with a capacity for reclaiming 12,000 lbs. of soda ash each day. The works will be done and ready for operation in about five weeks.

THE POTATO BUG UTILIZED.—The long suffering and much vilified potato bug has at last vindicated his right to exist by proving his usefulness. No longer will the cheerful cochineal and mercenary madder monopolize the furnishing of the scarlet dyes that brighten our fabrics. Alongside of these aristocratic and costly pigments the lowly Colorado beetle will take his humble place, and plunging into the dyer's kettle will slowly dissolve himself into a beautiful scarlet dye. Thus shall he become precious, and the Granger, heretofore his bitterest foe, shall foster and care for him as a most precious product.

GUTTA-PERCHA CEMENT.—This highly recommended cement is made by melting together, in an iron pan, two parts of common pitch and one of gutta-percha, stirring them well together until thoroughly incorporated, and then pouring the liquid into cold water. When cold, it is black, solid and elastic; it softens with heat, and at 100° Fahr. is a thin fluid. It may be used as a soft paste, or in the liquid state, and answers an excellent purpose in cementing metal, glass, porcelain, ivory, etc. It may be used instead of putty in glazing windows.

REMOVAL OF IRON MOLD.—D'Arcet applies to the spot very dilute sulphuric acid and a solution of yellow prussiate. The spot of Prussian blue thus produced is removed by washing. Another method proposed is to rub gently with cream of tartar, moistened and in powder, and then to wash; or apply sulphuret of sodium, followed up by dilute muriatic acid; then to wash with clear water, and finally with weak soap lye.

CHROMATE TANNING PROCESS.—Heingerling proposes to use sulphate or chloride of chromium, either alone or in addition to the chromates. Chloride of aluminium may be advantageously used instead of alum or sulphate of alumina.

REMOVAL OF GREASE SPOTS.—Fatty oils have a greater surface tension than oil of turpentine, benzole, or ether. Hence, if a grease spot on a piece of cloth be moistened on the reverse side with one of these solvents, the tension on the greasy side is larger, and therefore the mixture of benzole and fat or grease will tend to move toward the main grease spot. If we were to moisten the center of this spot with benzole, we should not remove it, but drive the grease upon the clean portion of the cloth. It is, therefore, necessary to distribute the benzole first over a circle surrounding the grease spot, to approach the latter gradually, at the same time having blotting paper in contact with the spot to absorb the fat immediately. Another method, namely, to apply a hot iron on one side, while blotting paper is applied to the other, depends upon the fact that the surface tension of a substance diminishes with a rise of temperature. If, therefore, the temperature at different portions or sides of the cloth is different, the fat acquires a tendency to move from the hotter parts toward the cooler.—*The Pharmacist*.

A MAN OF NERVE.—A thrilling accident occurred at the American Iron Works, in Pittsburgh, on the 2d inst. While Robert Moore was at work at his rolls his catcher failed to seize with his tongs a bar of white-hot iron which had been placed between the rolls. The iron twisted itself thrice around the roll, forming a "collar." The catcher struck the iron, when there flew off a piece in the shape of a ring, with a stem 20 inches long running off at right angles to the circle. The band flew back and fell around Moore's head, resting on his shoulders. Quick as thought he grabbed the long stem with his tongs and the white-hot ring with his hand, and with steady nerve and gentle movement lifted the fiery thing from his shoulders. His face was badly burned and the flesh of his hand was cut to the bone. After the iron had cooled he put the ring over his head—it was but two inches larger in diameter than his head.

PROTECTION AGAINST MOISTURE.—In order to prevent the rapid deterioration of wooden vessels when exposed to moisture, they may be thoroughly dried and then painted with two or three coats of a solution of paraffine in benzole. If the vessels are to be subsequently exposed to heat, a final coating of linseed oil varnish, or soluble glass should be given. If soluble glass is used, the vessel should be subsequently washed with dilute hydrochloric acid.

STEAM BOILER CEMENT.—Mix two parts of finely powdered litharge with one part of very fine sand, and one part of quicklime which has been allowed to slake spontaneously by exposure to the air. This mixture may be kept for any length of time without injuring. In using it, a portion is mixed into paste with linseed oil; or, still, boiled linseed oil. In this state it must be quickly applied, as it soon becomes hard.

GOOD HEALTH.

Absence of Mind a Sign of Incipient Mental Disease.

It is essential to skill that the muscles of the body should work unconsciously; but the moment they assert, as it were, their independence of self-consciousness, and prompt to the initiation of efforts outside of what they have been taught, a diseased condition is begun which we call "absence of mind." Such a habit begins in little things, more generally by an omission than a commission. Thinking of something else while dressing, a part of the toilet is overlooked, the necktie is forgotten, the wrong coat is put on, the hair is unkempt. Soon, as the habit increases, absurd and even harmful acts are committed. The collection of anecdotes are full of such follies. We know of an able young lawyer, who, instead of pouring a tonic from a bottle on his desk, carefully emptied the ink from his inkstand into a spoon and swallowed it. Another, an ex-Attorney-General of the United States, went on a fortnight trip to attend an absorbing legal case. His wife packed a half dozen shirts in his portmanteau. On his return there were no shirts visible. Pushing her inquiries she found that her husband had regularly donned a clean shirt every other day but had forgotten to take off the soiled one, and now returned wearing the whole half dozen. An authentic anecdote of the great political economist, Adam Smith, tells us that when called upon to sign a contract, instead of writing his own name, he made an elaborate imitation of the signature of the other party which had already been affixed. Such incidents tend to depreciate a man, though perhaps unjustly, in the opinion of those with whom he does business. They become also a grave annoyance to the individual himself. In a sense they are mental weaknesses which, pushed to a certain degree, pass into mental diseases. Senility and insanity are not unfrequently marked by automatic actions, carried out without the will or consciousness of the doer. The absent-minded one, like the sleep-walker, performs actions without the knowledge of them, and neglects duties which are pressing. Justly, therefore, it is a source of anxiety with every thoughtful person when he finds himself falling into this bad mental habit. It is usually gradual in its onset, steal-

ing over one in moments of intense occupation. Unlike other mind-weaknesses, it is not the foe of the idle man so much as the busy one. Yet habits of reverie and day dreaming may, also, bring it about. Those who feel this habit creeping over them will do well to make an early and special effort to resist it. It can be conquered by a habit of attention, and by ever self-chiding when the mind yields to it.—*Medical and Surgical Reporter*.

PHYSICAL EDUCATION.—Absolute health is only attained when the body is equally developed in all its organs and members. The man with muscles of steel and a diseased heart cannot be said to be in good health, and diseases of stomach, heart and nervous system are often—it may even be said usually—produced by that system of development known as training. At a recent rowing match in Philadelphia, two plucky lads in contesting boats fainted as soon as the race was over. Their condition, which was apparently good, was actually abnormal, and their systems gave way because the strain which their muscles met was too great for their vital functions. Recently a similar but more serious calamity occurred at Sag Harbor. A Brooklyn lad who had taken part in a pedestrian contest, when removed from the track, fell down dead. He had prepared himself for walking and running, and depleted his vital organs to build up his limbs. When the strain came the impoverished and most important part gave way. The severe muscular exercise of college athletes has carried off many fine young men by consumption, heart disease and other disorders, directly traceable to the absurd overwork required of their bodies. There is a limit of human endurance. That limit is reached when the body is impaired in one quarter to benefit special organs. The severity of the test by which athlete prizes are won seems designed rather to award the laurels to him who is the least healthy, because more unevenly developed, than to the really best man.—*Brooklyn Eagle*.

THE BODY NEVER IDLE.—The most inveterate idler cannot prevent his body from working; that is clearly impossible; the body must keep hard at work or it will die. Suppose the stomach refused to work within ten minutes after a hearty dinner, the man would die in convulsions in a few hours; or cholera or cramp colic would rack and wreck him. Supposing the pores of the skin—meaning thereby the glandular apparatus with which they are connected—should go on a "strike," he would in an hour be burning up with fever; oppression would weigh upon the system, and soon become insupportable. Suppose the liver became mulish, the appetite would become annihilated, food would be loathed, torturing pains would invade the small of the back, and the head would ache to bursting. And so with all the functions of the body. How wonderful the beneficence that enables us to keep this complicated machinery in order by the pleasant process of eating and drinking.

A NEW WAY TO TREAT DIPHTHERIA.—Quite a discovery in the treatment of diphtheria has been made recently. A young man whose arm had been amputated, was attacked with diphtheria before healing took place; and instead of the matter incident to that disease being deposited in the throat, the greater portion appeared on the wounded arm, and the diphtheria was very light and easily managed. Dr. Davis profited by this, and in his next case of diphtheria blistered his patient's chest, and on this blistered part the chief deposits appeared. This was also an easy case of the disease. The theory is that diphtheria usually appears in the throat because of the thinness of the lining of the throat. Hence, when the blister breaks the skin upon the outer part of the body, the disease appears there.

THE WHOOPING COUGH CURE.—The Detroit *Free Press*, in speaking of the benefit derived by children suffering from whooping cough from frequent visits to the purifying house of a gas works, says: "The children are sent there usually by direction of the family doctor to inhale the ammonia which arises from the purifying boxes." As a matter of fact, it is not ammonia that does the business, or they might inhale it at home, but certain substances found in coal tar called phenol or carbolic acid and cresol. Cresol is closely related to carbolic acid, and is sold for use in cases of throat difficulties, under the name of cresolene. It may be vaporized in the patient's room, and he has all the virtues of the purifying house, with none of its unpleasant features.

CONVERGENT SQUINT.—Dr. C. A. Bucklin, in an article in the *Medical Record*, on the cause and treatment of squint, expresses the opinion that every squinting eye that is not due to paralysis of a muscle can be straightened. In convergent squint the use of one eye is usually lost; consequently its earliest symptoms should receive prompt attention. Dr. Bucklin has had the advantage of examining over 200 cases of squint, and illustrates his text with a few of the more interesting ones to show the success that has attended the treatment which he therein recommends, that of tenotomy, or division of the tendon of the abnormally shortened muscle.

AN EMETIC FOR INFANTS.—A correspondent of the *British Medical Journal* states it is his experience, that half a teaspoonful of glycerine acts as a simple and efficient emetic for infants.

The Week.

Christmas week comes but once a year, and this year it comes with unusual welcome, as it has brought with it a most abundant and continuous rain. For the hydraulic miners the rain is one to make them all rejoice. Some of the farmers may have a little too much, but generally speaking the copious rainfall thus early ensures an abundant and prosperous year for California. With spring rains, full crops are assured all over the country.

We print this week a 24-page edition of the PRESS, and desire to call the special attention of our readers to its contents, embracing a large amount of original and condensed selected matter of interest and value. The index, which will be found on the last page, shows that the close of the volume has come. To those of our readers who file and bind the PRESS—and we hope they are many—the index is indispensable.

We hope that all our readers who are with us this year will continue with us next. And speaking of that reminds us to remind them that New Year is a good time to send in subscriptions. We will not urge our claims in this direction, but let our work speak for us.

And while congratulating ourselves on concluding our labors for the year, and assuring our readers of renewed exertions, we must not forget to wish to all, "A merry Christmas and a happy New Year."

Ourselves.

We hope that a perusal of the MINING AND SCIENTIFIC PRESS will convince anyone into whose hands it may fall, that if he is not a subscriber he ought to be. People on this coast interested in either mining or mechanical pursuits, or desiring to keep posted on the scientific progress of the age, should give their support to the journal which furnishes them with information on these topics.

A glance at the copious index on the last page of this issue will show the variety of topics which have been discussed in the half-yearly volume, which this number closes. It is unnecessary to call attention to special articles—they speak for themselves. We have of course given prominence to such information as would interest the miner, metallurgist and mechanic, as we shall continue to do. We propose in the coming year to improve the PRESS very materially. The widespread interest in mining matters which now exists, has very much broadened the field.

It has brought numbers into mining who will eventually benefit it. Large tracts of undeveloped country are now being opened, and many old districts are being re-worked. To keep posted in the improvements being made, those interested in mining matters generally, should by all means read the PRESS carefully. We keep close watch of all improvements at all likely to be of value or benefit to our readers.

We close our 41st volume this week. The PRESS is the oldest mining journal published, not only on this coast, but in the United States. Our files form a complete historical record of the progress of precious metal mining on the Pacific coast of the United States. We are familiar with the records of the various districts, and of the various metallurgical ventures made from time to time, whether at home or abroad, enjoying in this respect facilities which more recently established journals do not have. The long experience of the publishers and editors in conducting a technical journal, must result in benefit to its readers. All we ask is the co-operation and assistance of those to whose interests we are devoted, and we feel sure that both will be extended to us in the ensuing year as in the past years.

Nomadic Miners.

The dull and slack times which prevail in Nevada just at this time, as well as in parts of California, have been the cause of many miners "pulling up stakes" and starting out for new fields. These men are leaving the big centers like Virginia and Eureka, as well as the less important camps. Most of these miners are moving south to the newer districts of Arizona and New Mexico, where they hope either to find claims for themselves, or to get work from the companies. This exodus has continued so long now that Arizona, at least, must be pretty full of miners, and the overflow will go into New Mexico. Some of the papers down there are already saying that there are more miners than work can be provided for, unless they come "fixed" to prospect. Men who must have work, however, are more plentiful than is pleasant. Those who are doing half way well had better stay where they are, unless they can afford to prospect, for neither New Mexico nor Arizona are lands flowing with milk and honey. A good many miners down there are advising their friends to stay at home and let well enough alone. Some miners are also getting ready to go over to the Wood river country and vicinity, Idaho, which is just now attracting a good deal of attention. Montana will also soon attract a great many. The railroad prospects are good for her, and there are wide extents of unprospected country within her borders which will furnish work for many miners. A peculiarity of the Wood river country is that the miners can sell their ore as they take it out, in quantities from a ton up. The ledges pay from surface down.

Going to any of these places, however, with just enough money to get there and depending on finding work the next day after arrival is a poor prospect. Miners are proverbial for their nomadic habits, and also for improvident habits, and not many of them can afford to rest idle for several months at a time. Those with any sort of prospects had better remain where they are for a while, rather than wander around blindly in the hope of something turning up because the camp or the country is a new one.

THE BARBEE & WALKER, Silver Reef, has paid in dividends, \$60,000; the Leeds, Silver Reef, \$78,000; the Stormont, Silver Reef, \$135,000; the Horn Silver, Frisco, \$200,000, and the Ontario, Park City, \$3,100,000. These are the only dividend-paying mining stocks of Utah on the stock boards.

Hydraulic Mining.

With our hydraulic miners the past has been a fairly prosperous year. Though late in getting to work, on account of the severity of the preceding winter, whereby the water was frozen up and the ditches filled with snow and ice, still the season proved, on the whole, an extremely favorable one, water being abundant and holding out until an unusually late period in the summer. Several of the larger companies might be said to have had water throughout the whole year, not having discontinued gravel washing entirely until the month of November. This only left them time enough to clean out their ditches and put their claims in good working shape before the advent of the recent winter rains, so short an interregnum of active operations having perhaps never occurred before in the history of hydraulic mining.

This branch of mining has, in fact, been improving somewhat for a number of years past, a result due to a variety of causes, such as greater experience gained by those engaged in it, to the employment of improved apparatus, increased water supply, better facilities for disposing of the tailings, etc.; no year having passed without bringing with it material gains in each of these respects. In nothing has this pursuit been so much advanced as through the constant enlarging of old and the building of new ditches, and the construction of reservoirs for storing and retaining for future use large quantities of water that before ran to waste. Through these additional aids the capabilities of this class of mines have, within the past few years, been increased fully 20%.

Then, the productive capacities of many of these properties have, of late, been largely augmented through the driving of lengthy bed-rock tunnels, whereby the miners have been enabled to reach and run off the deeper lying and richer strata of gravel occupying the old river channels. As nearly all these structures have been attended with a heavy expenditure of time and money, they have severely taxed the financial resources of the companies driving them. But these companies will, in most cases, derive from these works great benefits, besides enjoying for many years, and perhaps perpetually a respite from further burthens of this kind. Being so highly favored as regards water supply, most of the leading hydraulic companies in California have, during the year just closed, made large clean-ups. As a consequence, dividends with the majority of them have been frequent and liberal; the profits arising from this style of mining being in most cases large, comprising generally from 50% to 70% of the gross production made. In some instances the net earnings realized instead of being disbursed to the owners in the shape of dividends have been expended in the purchase of additional ground, in the construction of ditches or in effecting other needed improvements.

This description of mining, though not confined to California, has in this State reached its greatest perfection and is here practiced to an extent and on a scale not elsewhere approached. The most active sites of this industry have during the year, as heretofore, continued to be in the neighborhood of Dutch Flat and Gold Run, on the San Juan ridge, about Smartsville, at and near Cherokee, Butte county, and along and in the districts adjacent to Slate creek. While the deposits on the Forest Hill divide, Placer county, are, in point of magnitude and richness, second to none elsewhere, the insufficient water supply restricts hydraulic mining in that locality to a comparatively narrow limit.

In Trinity, Siskiyou and Del Norte counties, occupying the northwesterly angle of the State, the business has been prosecuted over a large extent of territory and with a good measure of success, many of the conditions there, such as ample water supply, abundance of gravel and immunity from the vexatious debris question, being extremely favorable. But the old Placene river channels proper, with their immensely rich bottom deposits, do not there occur, or at least have not as yet been met with, showing the affluence and strongly marked features that characterize this class of deposits in the more central mining counties of the State. Nevertheless, this northwesterly lying region presents through the above mentioned and other natural advantages a better field than can perhaps at this time be found anywhere else for embarking capital in this particular branch of mining. Gravel-bearing lands there are comparatively cheap, while water can, as a general thing, be introduced upon them by means of short and inexpensive ditches and under almost any amount of pressure desired; nor is there often much trouble about outlet for tailings, the most of these being discharged directly into the strong currents of swift-running rivers which sweep them down stream and leave them where they can neither obstruct mining operations nor cause damage to other interests. It should be observed, however, that these advantages are to some extent counteracted by the increased cost of freights, as well as of subsistence and labor in these remote and inaccessible sections of the State.

As regards the troublesome question of disposing of the hydraulic tailings or debris in localities where this material has caused or is likely to cause damage to farming lands or obstruct navigable waters, while it has not yet

been fully settled; still, such progress has, during the past year, been made toward that end as promises to ultimately effect its partial and perhaps full and satisfactory attainment. Both the State and the general government are now moving in this matter in a way that will, it is to be hoped, produce harmony of action among all parties concerned, if it do not fully protect every interest involved. Already litigation between the farmers and miners has been checked, with some prospect that it will be stopped altogether, as we trust it will be, seeing it can hardly be expected to subsolve any useful end to either of the parties litigant, if persisted in.

Viewed as a whole, the condition and prospects of hydraulic mining in California may be considered tolerably good. While subject to a good many difficulties and hindrances, it is probably as free from these as most other branches of the business. Certain it is these obstacles are, through increased experience, being constantly diminished, the results reached of late years being more uniform, and every way more satisfactory than during the earlier stages of this industry.

Assessment Work on Claims.

The year during which work on mining claims must be done to comply with the United States regulations, begins on the 1st day of January. This is required by the amendment to the laws which was passed in March, 1880. We have published this several times, but here it is again, to make sure no miner will miss it.

"Provided, that the period within which the work required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of such claim, and this section shall apply to all claims located since the 10th day of May, 1872."

Under the old law the year began from date of location. Now, however, the miner must begin his work on January 1st, to expend the \$100 on "labor or improvements."

A claim located October 1, 1879, requires the expenditure within the year of 1880, and whatever may have been expended during 1879 will not answer the requirements of expenditure in 1880. It appears by reason of the change made in the requirements of the act of May, 1872, by the amendatory law, that a claim located on any date subsequent to the 1st day of January, 1879, requires no further expenditure during the remainder of that year than is made necessary by the local laws.

We hear that in several camps people are ready to jump claims on Jan. 1st, if the miners are not present. People have gone from this city up country to relocate claims if the original owners are not on hand. In one camp, a band of men have organized to go out at 12 midnight on the last day of the year, and relocate those claims where no one is at work. This kind of game, however, will not work, and if the owner was at hand on his claim at the usual morning working hour, his rights would no doubt be protected by the courts if it came to a contest.

It behooves all claim owners, however, to look out for their property and see that it is not relocated.

THE MUSSEL SLOUGH CASE.—The jury in this case after being out all night, rendered a verdict on Thursday morning of "guilty of resisting the United States Marshal, as charged, but not guilty of conspiracy." The defendants were remanded to custody to await sentence, with bonds raised to \$5,000 each. Counsel for defense gave notice that they should move for a new trial on questions of law and fact. Judge Sawyer fixed the second Monday in January as the time when he would hear arguments on motion for a new trial. The penalty, as announced by the Court, could not exceed a fine of \$3,000 or one year's imprisonment; or both fine and imprisonment.

MINTING CHARGES.—Mint Director Burchard has advocated before the House Committee on Coinage the reimposition of melting and coinage charges. This accords with the recommendations of Secretary Sherman, who suggested in his annual report the propriety of imposing a melting charge in all cases of deposits of bullion, either for coinage or refining. As to the charge for coining, the Secretary says that experience shows that, other circumstances being favorable, a coinage charge does not prevent a country from securing the coinage of the coin the condition of the foreign trade will permit it to retain.

MARIPOSA ESTATE.—The case of Joseph A. Donohoe vs. Mariposa Land and Mining Company of California, for foreclosure of mortgage for about \$250,000, has been decided in New York by Judge Evans in favor of plaintiff. The defence consisted of attempts to repudiate various previous settlements made by Mark Brumagim and one Stilwell, and on a pretended extension of time for payment of mortgage notes.

COPPER.—We had expected to give quite an extended article on copper in this issue, but will have to postpone its publication until next week on account of the crowded state of our columns.

The Richmann Drill.

The Richmann rock-drill is the most recent of the inventions designed for boring rock, and is the most improved. It was devised by Henry Richmann, of this city, patented by him through the MINING AND SCIENTIFIC PRESS Patent Agency, and is a remarkably perfect tool, being one of the most complete and ingenious inventions ever perfected on this coast. It is manufactured in our city by the Richmann Rock-Drill and Compressor Co., the same company also manufacturing the Richmann air compressor, which we illustrated and described in the PRESS of December 4th. Although the tool is of recent invention it has been very thoroughly tested, and is now doing practical and successful work in several mines on the coast. Such is the perfection of the mechanism that, in addition to its other features, the manufacturers are confident they can do the same work at more economical figures than other drills.

As before stated, the device is a very ingenious one, but is somewhat difficult to describe without the aid of detailed engravings. We shall endeavor to convey as clear an idea of the peculiarities of the construction of the drill as possible, without going too closely into details. It is well to premise, however, that this is worthy of the close attention of mining men, as the tool is one that has a great many favorable points, and which is doing successful work. Though a description may give the idea that it is complicated, such is not the case, as the desire and aim of the inventor has been to simplify the parts so as to avoid liability of damage or breakage, and so that in case of breakage any ordinary blacksmith or mechanic may repair it.

Before going into any description of the valve mechanism it is as well to describe the

Support and Clamp

For the drill, the method of connecting the case or carriage, carrying the cylinder, to the column, being novel, as well as the clamp for holding it in position on the column.

The semi-cylindrical case or carriage, in which the cylinder and operating mechanism of the drill are supported, has on its side a peculiarly-shaped hollow, bevel-edged trunnion, by which it is attached to the column or tripod. To connect the drill case to the column, a ring is placed around the column loosely, upon each side of which are bolts. Upon the bolts is fixed a peculiarly-formed clamp, made in two halves. By the

Peculiar Construction of the Clamp

And ring the inventor is enabled to keep the drill very close to the column and overcome an objectionable feature which is common to most rock-drills—that of the drill standing too far from the column. In a large drill they are now enabled to bring the drill-carriage within one inch of the column. The vertical and horizontal adjustment of the drill-carriage and drill is made by loosening the nut and sliding the clamp with its ring up or down, and moving the drill-carriage by its trunnion on the socket. In this way the drill may be moved or maintained in any position.

The adjustment of the drill-column itself as to decrease or increase of its length to adapt it to a shaft or tunnel and fix it in place is made in a peculiar manner. The column itself is hollow, so that the extension column or leg may move up and down inside of the column. Inside of the column is a screw-rod, and the extension column or leg being itself hollow and threaded inside, it is screwed up or down on the screw-rod by inserting a lever in the hole at the lower end of said leg.

The lower end of the column is split, and encircling this split is a spring-clamp, controlled by a screw. To

Increase the Length of the Column

To fix it in place between the floor and roof of the drift, a lever is inserted and the extension column or leg screwed down on its rod, thus being forced out of the column. When the extension-column is drawn out sufficiently to fix the column, by forcing the pointed leg into the floor, and the dogs at the upper end into the roof, the screw is turned and the spring-clamp tightened around the split end of the main column. This makes the lower end of the main column bind firmly around the extension or leg, which is thus prevented from turning and is fixedly held in place. The column can be extended two ft., is easily secured and perfectly steady.

Ordinarily a screw and nut are need to tighten up the extension-column, and the leg or extension-column is externally threaded, to screw up into the column. When, therefore, this leg is screwed out, the threads become exposed to injury. The nut is apt to get loose by the jar of running the machine.

In the construction of this drill-column the extension or leg has its threads in a position

where they are never exposed to get injured, and it is possible, moreover, to have a short column and still extend it quite a distance. When the clamp is tightened up, the leg is kept from turning round, and is better than a nut, since it will never jar loose.

So far we have confined ourselves to the description of the support and clamp. The drilling apparatus itself next claims our attention. The engravings given herewith give an idea of the external appearance of the drill and of the column and clamp, but the operating mechanism cannot conveniently be shown.

The cylinder and operating mechanism of the drill are supported in a case or carriage, which is clamped to the column as before described. On the side of the case is a

Feed-Screw

Chamber, enclosing the feed-screw and protecting it from injury. In the ordinary method of fitting feed-screws to drills, the screw is liable to become loose by the continued back and forth motion of the drill, owing, probably, to the defective means of securing the screw itself, the bearing of which becomes worn by the jar. This defect is overcome by forming, on the lower end of the screw, several annular V-shaped flanges, fitting in correspondingly-shaped grooves, in a little box which may be adjusted by a key, the key keeping the box ahead and preventing it from jarring. The screw is not, therefore, liable to become loose.

cause it to grip the drill-tool for the whole length of said clamp, but at no one point more than another.

The screw-threads on the sleeve are so formed that the rotation of the drill with its attendant jar tend to screw it tighter instead of loosening it, and, being internally threaded in two directions, it also acts as a jam-nut to hold the clamp to the drill-head. The drill-tool is thus held rigidly in place and has a long bearing, but is readily removed by loosening the clamp, which cannot jam, owing to the peculiar construction described.

To tighten or remove the drill it is necessary to put a pin or lever in one of the holes of the drill-clamp and hold it, and by turning the sleeve when the clamp is held still, the drill can be either removed or tightened, according to the direction in which the sleeve is turned.

The most novel feature in the whole device is the

Operation of the Valves

Controlling the admission and emission of steam or air to the piston, and the means by which the piston itself is operated, and also the method by which both valve and piston are cushioned.

The cylinder is not bored the same size all the way through, since the piston is made of two diameters, to which the cylinder must be accommodated.

Usually in rock-drills there is not as much force exerted on the piston on the back stroke

ment of the ports in combination with the double-headed piston valve. The method by which the

Rotary Motion of the Drill

Is imparted, is such that a very small rotary movement can be made, while, at the same time, plenty of grip is given to the ratchet, etc., by which it is accomplished.

The teeth of the ratchets are made in a peculiar form to adapt themselves to take up wear. Between each tooth is a slot, cut deeper than the tooth. It is on the beveled faces of the teeth themselves that the wear occurs from constant friction; but the faces of the teeth formed in this manner may wear until the lower edge of the tooth is worn down to the bottom of the slot before the point of the tooth will touch and be worn off.

In the working of the ratchets, when the teeth disengage, the point of the upper tooth will not drop from the point of the lower tooth in a vertical line in taking a new grip, but will jump slightly. In doing this in this improved form of tooth the point of the upper one will catch on the back of the slot and be directed against its disengaging tooth without much slip. In this way all wear is taken up automatically, and the teeth are sure to engage.

As the piston is moved back by the air or steam, the drill-head and drill are rotated by the pins or lugs in said drill-head sliding in the

diagonal slots in the ratcheted sleeve, the sleeve itself being held by the ratchets of one of the sections engaging with the sleeve-teeth. The drill-head, piston-rod and piston are therefore turned slightly, so that at the forward stroke the cutting-edge of the tool in the drill-head is presented in a new position in the drill-hole. The springs under the sections keep them engaged at all times with the teeth of the ratcheted sleeve. A good firm grip or engagement of the ratchet-teeth is insured by this arrangement, and when the turn of the drill and head is only slight there is no danger of the teeth missing, since with two sections a turn of only half the width of a tooth will admit of an engagement with one or the other of the sections.

Two sizes of the drill are now made. No. 1 is a light mining drill, 2½-inch cylinder, and weighs about 135 lbs. It is adapted to all kinds of work, and will be found particularly useful in working in narrow stopes, being small, compact and powerful, making 1,200 strokes per minute and feeding 18 inches.

No. 2 has a 3-inch cylinder, and weighs about 155 lbs. It is more powerful than No. 1, and is adapted for heavier work. It will drill holes 2 inches in diameter and feeds 20 inches. The working parts are all under the cylinder.

Those who are interested may see this drill at work at the manufacturer's, whose address is 27 Stevenson street.

THE YOSEMITE.—J. M. Hutchings, the guardian of the Yosemite and Mariposa Big Tree parks, passed through Stockton recently, en route to San Francisco, whither he is called by the burning of his home. Mr. Hutchings states that the valley was dreadfully neglected by the old commissioners; in fact, everything seemed to have been done to keep tourists away from it—the grandest of Nature's wonders. He recently set men to work clearing the river from the timber which had fallen into it, and had made sufficient from the sale of the same for firewood to pay the cost of clearing. Mr. Hutchings believes that much can be done to make the place more attractive to tourists. There are a number of improvements which can be made. For instance all the roads to the valley should be thrown open without toll, so that a visitor should not have to pay a cent for this class of expenditure the moment he gets within the grounds. To carry this out, it will of course be necessary to buy out the owners of the present toll roads, but this would be a paying investment, as inviting travel to this State. Footpaths should now be made between the different hotels, to afford visitors the opportunity of passage.

REMOVING SCALE FROM WIRE.—Dr. Hermann Wedding speaks emphatically on the importance of adopting mechanical means for removing the scale from the wire after it has been annealed. In a Westphalian establishment the Altpeter scouring system was introduced in order to supersede partly the removal of scale by pickling. Formerly 18.5 parts of sulphuric acid was used in pickling wire rods and 6½ parts for wire drawn, for every 1,000 parts of finished wire. After the introduction of the new process, the consumption of acid decreased to 2 parts per 1,000 parts of wire.

MIXED FIBERS.—Manufacturers know that vegetable fibers mixed with woolen fibers cannot be equally spun, dyed, etc., together, because vegetable fibers are straight, whereas animal fibers are spiral in form. Herr Neumann, an Austrian scientific man, claims, however, to have discovered a chemical process by which such a combination of varying fibers may be rendered amenable to the operations mentioned.

RICHMANN ROCK DRILL ON TRIPOD.

RICHMANN ROCK DRILL ON COLUMN.

The method by which the drill-tool is secured to the drill-head or piston-rod is peculiar, and is such that it is gripped securely, not at one point alone, but for all its length inside the drill-head. To accomplish this the drill-head, which is attached to, or forms part of the piston-rod, has a tapering bore formed in the end, and its outer end has right-hand threads upon it.

The Drill-Clamp.

The drill-clamp is made in two or more pieces, and is tapered to correspond with the tapering hole in the end of the drill-head. A slot is formed in the tapering portion, into which a small screw projects, this screw passing through the drill-head and setting in flush. The slot is extended or elongated to allow of the clamp being moved inward or outward for a certain distance; but the screw prevents the clamp coming out altogether. The outer end of the clamp has left-hand threads formed upon it inside of the shoulder.

To cause the clamp to grip the drill, a sleeve is employed, the inner portion of which is threaded, half right and half left with threads of different pitch. That portion nearest the drill-head is threaded to take the right-hand threads of the drill-head, and that portion nearest the drill is threaded to take the left-hand threads of the clamp, which are of different pitch from the threads of the drill-head end. To insert the drill in the clamp the clamp proper is slightly screwed out by turning the sleeve, and opens enough to allow the drill-hut to enter, and is then screwed back. To cause the clamp to grip the drill tightly the sleeve is screwed in, thus drawing farther into the beveled hole in the drill-head the beveled clamp carrying the drill-tool. As the clamp comes in the beveled sides squeeze the clamp more tightly, and

as on the forward stroke, since the presence of the piston-rod at the front end reduces the effective area of the piston at that end. Drills sometimes, therefore, stick or move slowly in being moved back, a defect which Mr. Richmann remedies by making the front end of the piston larger than the rear. The increased diameter of the front end is sufficient to account for the loss from the diameter of the rod, and the opposite ends of the piston are, therefore, of the same effective area. He has, consequently, the same piston-area at both ends, and the piston is given the same power in drawing back as in going ahead.

The cylinder has attached to it on one side an air chest in which the valve moves, this little valve controlling the admission and emission ports. The arrangement of the ports, in combination with this, is most ingenious, and it is really in this that the drill excels. The valve and piston move in the same direction, and the admission and exit of air is, therefore, regular, the jar communicating to the parts not affecting it.

The valve and piston are both perfectly cushioned. One of these drills has been run 1,500 blows a minute for a week at a time, in the shop, striking at air alone, which is a most severe test, yet pieces of paper, placed on the inner sides of the cylinder-heads, showed no signs of being touched. No packing, springs, or rubber are used to lessen the jar, a perfect air cushion being formed at both ends. It can, therefore, be run at great speed without the possibility of striking or injuring the heads. Thus speed can be maintained at any pressure. The valve motion though simple in operation, is very difficult to understand from a mere written description. It is all accomplished by the peculiar arrange-

Manufacturing and Other Industries of the United States.

The manufacturing industries of this country are carried on by the direct labor of about 3,000,000 of prosperous working people employed in about 300,000 separate mills, shops and manufacturing establishments. To keep this great army of workmen employed requires an investment of \$2,500,000,000, and the direct annual payment to employees of \$1,000,000,000. The raw material involved is valued at \$3,000,000,000, while the value of manufactured products annually turned out is estimated at \$5,000,000,000. To accomplish all of this, 50,000 steam engines, as many water wheels, and 3,000,000 of horses are required.

Cotton Manufacture.

In tracing the progress of our various manufacturing industries, we go back less than 90 years to reach the first cotton mill, and a very small one too, which was started at Pawtucket, Rhode Island, by Samuel A. Slater, just before the breaking out of the war of the Revolution. From that small beginning, the business has steadily grown from year to year until \$1,500,000,000 pounds of cotton are required to supply the many thousands of mills planted all over New England, and more or less frequently met with in nearly every State in the Union. The present annual value of the cotton manufactures of this country is estimated in round numbers, at \$500,000,000. The products of our looms are found in almost every land on the globe, not excepting England, herself; where, even in the city of Manchester, itself, the Wamsutta mills, of New Bedford, have long had an active and profitable agency for the sale of their goods. Our exports of cotton goods are now rapidly on the increase. We exported in 1874, cotton goods to the value of \$3,095,840. Since that time the advance has been as follows: In 1875, \$4,071,832; in 1876, \$7,722,278; in 1877, \$10,235,843; in 1878, \$11,438,660. From this it will be seen that the export of cotton goods was more than trebled during the five years enumerated. It is true, that the year previous to the war we made a most exceptionally large exportation. But that branch of trade was nearly ruined during the years of our internecine strife, and is only just now beginning to reassert itself. Its future growth can scarcely be calculated.

Woolen Manufacture.

The first rude woolen mill in this country was established at Newbury, Mass., in 1794. Since that time our woolen manufactures have grown in extent and excellence until that business now employs a working capital of \$300,000,000, and numbers over 1,200 sets of machinery kept in motion by over 200,000 operatives, as well skilled as can be found in any part of the world. The annual output of goods is valued at fully \$208,000,000, which in point of cheapness and excellence, successfully competes with the best products of Europe.

Our Silk Industry.

The manufacture of silk, after struggling with difficulties of almost every conceivable character for nearly half a century, has recently secured a permanent foothold, and entered upon a period of prosperity as marvelous as it is encouraging. Among the most successful parties are the Cheneys, of Connecticut; but the steady persistence of the silk manufacturers of Patterson, N. J., has finally resulted in an almost marvelous degree of success. The silk manufactures in that place now number 250, with a production of goods to the annual value of \$30,000,000, which in strength, durability and finish are equal to the finest products of Lyons. In regard to the silk industry in the United States an English exchange says: "For many years the shrewdest merchants in the States scouted the idea that silk goods could be made in this country to compete with France. But the Americans are apparently in a fair way not only to dispense with manufactured silks from France, but also with the raw material from China and Japan."

Iron and Steel.

In the manufacture of iron and steel our progress has been even more marvelous than in that of textiles. The United States consumes more iron than any other nation, or one-fifth of all that is consumed on the globe. The quantity of iron and steel required to keep up and extend over 90,000 miles of railroad is simply enormous. Over 312,000 tons of pig iron are annually required for the construction of the single article of new wheels, on which our cars and locomotives run. Passing from railroads to bridges, houses, ship-building, fencing, etc., etc., the total demand for iron and steel reaches fully up to the vast annual total of 4,000,000 tons. The growth of our Bessemer steel product is equally as marvelous as the same product has been in Great Britain. Twenty years ago this wonderful illustration of the value of chemical science was looked upon as merely an interesting and curious process of extremely doubtful promise. But the Bessemer works of Great Britain alone, with 120 converters are now turning out about 800,000 tons of steel a year; while the United States, with not more than half as many converters, but superior in character and management, will produce over 200,000

with 500,000; then follows France with 300,000; Austria, 250,000; Belgium, 150,000; and Sweden and Russia together, 150,000. Stupendous as these figures appear, the demand for iron is everywhere increasing in an accelerated ratio.

Our Wheat Product.

The wheat-growing interest of this country embraces areas so vast that the work of gathering accurate statistics in regard to the annual yield is far more difficult than is the same work in the more narrow and densely populated countries of Europe. The returns for the present year are set down by different authorities at from 465,000,000 to 485,000,000 bushels. Taking the smaller estimate, 43,000,000 are credited to the Southern States, and 41,000,000 to the Pacific States, of which last amount, California has produced about 37,000,000—about 2,000,000 in excess of last year. The coast will have about 31,000,000 of this year's crop for export, to say nothing of the surplus which has been kept over from last year. The needs of the entire Union for food, seed, etc., is set down at about 295,000,000, which will leave a grand surplus of 200,000,000 for export. From the best information attainable, this surplus seems to be about 25,000,000 bushels in excess of the prospective demand. A small decrease in the price would, no doubt, largely increase the foreign demand; but the surplus is not sufficiently large or certain to justify any special fears that prices will be materially lower than those which now prevail.

Agricultural Machinery, etc.

No better idea can be formed of the rapid increase of our agricultural industries than by a reference to the increased demand for agricultural machinery. In 1850 the production of agricultural implements in this country gave employment to 5,351 hands; in 1860, to 12,867, and in 1870, to 23,251; by the census of 1880, which is now being tabulated, the present number of hands engaged in this industry is 40,680. This exhibit shows a doubling up of this industry every 10 years.

American agricultural machinery and American farm implements are beginning to be regarded with much interest in most foreign countries. An American mowing machine recently took the first prize in a trial on the distant fields of Belgium. Notwithstanding English prejudice, our farm implements and machinery are being very favorably received both in England and in her colonies. They are lighter and at the same time, generally stronger; the latter largely for the reason that they are made of better iron and better wood. An extensive English manufacturer recently sent his foreman to visit some of the leading workshops of the United States. He came and saw, and returned to his own country with much more respect for what his countrymen had called "Yankee brag" than is generally held by British workmen. The foreman conceded that nearly all which had been claimed for American machinery was literally true.

English Conservatism.

The great drawback with English mechanics is their dislike to innovations. They are inclined to stick to old processes and methods. They refuse to acknowledge that a machine can be made to do more perfect work than human hands. Hence they fail to compete more successfully with the more progressive Americans in the manufacture of sewing machines, of certain classes of fire-arms, watches etc. An English mechanic, who recently visited some of our work-shops, writes his impression to the *Sheffield Telegraph* as follows: "The use of files, rasps, and floats are superseded by other tools, (machine tools,) astonishing in their adaptability for perfect and rapid production. No written description could convey an idea of their great ability and method. The skill of the engineer has taken the place of the skilled artisans; for mere boys are tending these operations, and yet quality is not ignored. The readiness of the employers to adopt any practical suggestion from any one of their hands is a notable feature in most American factories, whereas the cold shoulder is generally given such in England. We weakly waddle in the wake of America in the matter of inventions until a necessity is proved, when an earnest effort is made and progress is attained. Old-fashioned methods of manufacture will have to be abandoned for newer and better ones, if *'Mene, mene, tekel, upharisin,'* is not to be written across British commerce in the future. The individual skill and handicraft of the best Sheffield workmen I have not seen surpassed in the United States, but they are inadequate for all the requirements of the present age."

American Competition Abroad.

All over the world attention is being drawn to American manufacturing goods, which are, if slowly, yet surely forcing their way into, and successfully competing in all foreign markets, with European manufactures. Our cotton goods, both heavy and fine, and spool-thread, are rapidly taking the place of English. Our printing and wrapping paper is finding a ready sale in the East and West Indies, and South America; while even bank note and bond paper is in demand in Rome, Italy, Austria and Spain. American cutlery is sold in Birmingham; our locks are supplanting those of English make in English dwellings and warehouses; American underwear finds a ready market in France, England and Germany; American jewelry is exposed for sale in the shops of Paris, and if we are not sending coal to New Castle, London is certainly talking of supplying her grates and furnaces with Anthracite from

American palace cars are now to be seen on English railways and American locomotives on various European roads. American street cars are threading the streets of London and Paris, while American elevators are being put into Paris hotels. We are finding a foreign market almost everywhere for machinery, chemicals, fire-arms, musical instruments, tobacco, axes, and edge tools of almost every description, shovels, cut nails, plated ware, "Yankee notions" and hundreds of other articles that need not be enumerated.

American Joinery Work.

The abundance and cheapness of our superior woods, and the superiority of our labor-saving machinery over British hand-made work has enabled our mechanics to export largely such articles as doors, sashes, blinds and inside finish work for dwellings to both England and her colonies. The manufacture of such joinery, by factory work, is distinctly an American industry, and has never been introduced to any extent into Europe. The first shipping of such articles was commenced only within four or five years; but it is already growing into an extensive and profitable business. The first large shipment to England was made in 1877, and consisted of 19,000 doors and 6,284 pieces of blinds. A large portion of this shipment subsequently found its way to Australia. No less than 45,000 doors were shipped from New York to England in 1878, and the trade is constantly increasing, and will continue to increase for the reason that English workmen will not use machinery, and lumber must be obtained either from Norway or America. During a single month of 1879 over 32,000 doors were shipped to foreign countries from San Francisco and New York. California comes in for a great share of this growing business. Her position is such that she need fear no competition in the supply of Pacific ports and islands. Australia is her most important customer for machine-made joinery and lumber, and there is no reason why this trade may not continue to increase indefinitely.

American Watches in England.

Have almost entirely superseded the English article, and to-day all the great lines of English railroads, both in England and India, supply their superintendents, conductors and guards with American watches in preference to any others. A writer in the *English Mechanic* says that there are over 300,000 American watches now in use in Great Britain, and advises manufacturers and the trade to "cease their futile disparagements of American watches, every one of which is a standard refutation in itself, and go to work and beat them if they can." Within the last few months, most of the leading English mechanical journals were engaged in an exhaustive discussion in regard to the relative merits of the American machine-made and the English hand-made watches. The result of the argument appears to sustain the practical view of the question taken by the English railroad managers. During the discussion, Sir Edmund Beckett, president of the British Horological Institute, said: "There can be no doubt in the mind of any one who understands machinery, that the American is the best as well as the cheapest way of making watches that require precision and uniformity." Mons. Jopy, a French manufacturer who employs some 8,000 hands in watch and clock making, in a recent address declared our machine products more accurate than the products of hand work.

New Discovery.

Ed. Greeley, one of the original owners of the Prospectus mine, has made a new and very important discovery about one mile in a southerly direction from this place, and near Table mountain. For many years it has been the opinion of prospectors that a mammoth ledge existed in the neighborhood of the new find, as rich float rock in abundance has been found there and on Table mountain, but no croppings were discovered, and the hunt, until a few days ago, failed to develop anything. The ledge found by Greeley is a blind ledge, and was struck within a few feet of the surface. It is on a direct line with the Prospectus, and the ore is exactly the same. This find demonstrates to a certainty that an immense true fissure vein courses from Humoldt hill to Table mountain, and by sinking deep enough anywhere between these two points the ledge can be struck. It also proves the theory entertained by many that all the float found on Table mountain came from Middle Silver and Last Chance hills in correct, though there is little doubt but that some of it did come from these points, as the character of the rock indicates. The project of running a tunnel from Del Monte mill to tap Last Chance, Middle or Silver hill, advanced by the *Herald* last spring, would, without doubt, develop bodies of ore that in richness and immensity have never been equaled anywhere in the known world. Here is a chance for capitalists to invest a few hundred thousand dollars that would return them a sum of money in comparison to which the significant fortune of the Rothschilds would sink into insignificance. —*Esmeralda Herald.*

The mining property situated near Hornitas, in Mariposa county, formerly known as the Number Nine mine, and more recently called the Yosemite, has been sold to Marcus and J. W. Hulings, of Oil City, Pa., for \$77,000. This quartz-church mill, besides many other valuable improvements recently built and com-

The Big Horn Country.

"The Big Horn country" is an expression used by miners to designate all the country drained by the southern tributaries of the Yellowstone river, west of Powder river. It includes the Wolf, Big Horn, Clark's Fork and Wind River mountains, or all the ranges and valleys north and west of the Black Hills of Dakota and between them and the old mining camp of Montana Territory and of northeastern Idaho Territory—taking a large extent of southeastern Montana and northern Wyoming. In its topographical features it is one of the most interesting sections of the continent, and the eye of the prospector has been turned toward it since the first discovery of gold on the headwaters of the Missouri.

From 1869 to 1875 attempts were frequently made by prospecting parties organized in Montana and Idaho, to explore these regions, but, owing to the hostility of the Indian tribes, about all their time was occupied in protecting themselves, and little prospecting was done by them. The reports made by these exploring parties have all been conflicting—some maintaining that the "Big Horn country" would develop into another California; others completely discouraged by their rough experience declaring that no paying gold mines exist in the Big Horn mountains. The total failure to find paying gold deposits of a strong prospecting expedition which left Deadwood in 1876, and crossed the Big Horn mountains to the Yellowstone river, near where Fort Keogh is located, was the most discouraging blow ever given to prospecting in the Big Horn country; but, considering that this Black Hills party was almost entirely composed of newly arrived emigrants from the Eastern States, who were ignorant of practical gold mining, and that the leaders were Montana miners only anxious to return to their old diggings in safety, it was a reasonable foregone conclusion that it would not find anything. But an important point in all the reports of prospecting along the upper southern tributaries of the Yellowstone is this—all agree that encouraging indications were found—"colors" have generally been found in the gravel panned out, and encouraging prospects obtained from the float quartz picked up. Taking this important point as the basis of speculation, and taking into consideration the vast extent of the Big Horn country, and the fact that in all the great mining regions the sections of actual productiveness are of insignificant extent as compared with the entire area of mineral indications, it may be reasonably concluded that the Big Horn country is a prospective mining field of great promise. Rich silver ores exist in places on the head of the Clark's Fork, and gold veins have been found in the Wind river—which is in fact the upper Big Horn river—placer deposits are being and for years have been worked on the upper Yellowstone, about 25 miles above the old Crow Agency, and placer prospects have been found on the Crazy Woman's Fork, three-fourths the way across from the Yellowstone river to the Black Hills camps. These actual developments, so far apart, and representing all sections of the Big Horn country, seem to show that the Black Hills are but the eastern extension of auriferous and argentiferous regions which extend several hundred miles to the northward and westward. If this view is correct it gives us a vastly enlarged idea of the extent and promise of our American gold and silver mining industries. Sitting Bull, his forces decimated to a little starving band who are supplicants for mercy on any terms the government chooses to impose, will no longer terrorize those regions and we have an assurance that they will be entered and crossed by two if not three railroad lines within the next three years—the Northern Pacific by way of Bismarck, and the Chicago and Northwestern by way of the Black Hills, and possibly a branch from the Union Pacific, by the National Park.

TO PROTECT GOVERNMENT TIMBER.—Our Red Bluff correspondent recently gave us a vigorous letter on the evil of firing the timber on the untaken lands of that county. We notice that Secretary Schurz brings up the subject of protection to Government timber in his annual report to the President. He outlines the following legislation as necessary: "First, that the Government should be authorized to sell timber from the lands principally valuable for the timber growing on them; that is to say, not suited to agricultural or mineral purposes, at a reasonable price above the nominal rates, to supply all domestic needs and all wants of local business enterprises, as well as for commerce; the latter so far as compatible with the public interests. Secondly, that these sales of timber be so regulated as to reserve the necessary proportion of the forests on public lands from waste and indiscriminate destruction. Such a policy can, in his opinion, be carried out without great cost, and in perfect justice to the settlers and business enterprises of the country. It is virtually the policy proposed by the Public Lands Commission in their report, and the bill submitted to Congress at its last session. He again urges the enactment of a law, prescribing severe penalties for the wilful negligence or carelessness, setting of fires on public lands, and providing for the recovery of damages sustained. *Rural Press.*

THE concentrating works at the Great Basin mine, Stockton, have started up. Water is conveyed to the works through five miles of

Gold and Silver Refining.

There have been and still are a number of different processes by which gold and silver are refined. The one which was formerly in most general use was the nitric acid process.

After the proper portion of gold and silver are inquarted and granulated, the granulations are treated with nitric acid, the acid dissolving the silver and forming nitrate of silver, the gold settling to the bottom of the pots. The solution, after being drawn off, is treated with sodium chloride (common salt dissolved in water), the silver being precipitated as the chloride of silver. The precipitate is then washed till it is "sweet," and reduced with iron or zinc to metallic silver. It is then refined by fluxing.

This process was used in the United States Assay Office till the year 1866, when Mr. Andrew Mason, the melter and refiner, introduced the present system or process. A complete description of this process of refining as carried on at the assay office in New York city was written by Edward E. Sage, C. E., and published in the "School of Mines Quarterly" of Columbia College, for November. Mr. Sage says:

This process consists of seven different operations.

(1.) Inquartation and Granulation of the Bullion.

The gold and silver are sent from all parts of the country, consisting of bullion, amalgams, plate, etc. These are melted and assayed, and are then turned over to the melter and refiner. The bullion is again melted in a large graphite crucible; the charge being made up so that the gold and copper shall not exceed one-third and one-twelfth parts of the entire weight of the metal. When the metal is melted and thoroughly mixed, it is granulated by pouring it into a cylindrical iron tank, three ft. high by three ft. in diameter, filled with cold water. A peculiar rotary motion is given to the metal as it is being poured.

The tank is supplied with a copper colander, which, when the charge is all granulated, is raised by means of an iron crane, the water nearly all running off. It is then poured on an inclined iron table to allow the rest of the water to drain off.

(2.) Solution of the Granulations.

The pots used for the parting of the alloy are made of case iron, three ft. and a half and two ft. in diameter, by three ft. and two ft. in depth, and are set on brick fireplaces.

There are four pots holding 160 gallons, and three, holding 50 gallons. Each pot is covered with a funnel-shaped hood of sheet lead, with an opening 30 inches long, through which the charge is introduced, and which has a sliding door. From each of these hoods a lead line to the condensing chambers, which are two in number, on the floor above; from the last of these a long winding leaden line leads into the stack. Both chambers have platforms, on which coke is laid several ft. in thickness; through this the fumes pass, and are condensed. These chambers are supplied with water sprinklers, so that a spray of water is continually cooling the atmosphere in the chambers. Nitrous fumes are furnished by nitrate of soda, acted upon by the sulphuric acid.

About 300 lbs. of the granulations are put in each of the larger pots, with about 650 lbs. of sulphuric acid, and 250 lbs. more of the acid is gradually added during three hours' boiling. The resulting solution is then run off by means of a siphon into the receiving vats on the floor below.

The fire being withdrawn, a partial charge of acid is added, and the gold residue is then taken out by means of a perforated iron ladle, and placed in two of the smaller pots. In these it is boiled for six hours, with three successive charges of about 300 lbs. of acid. It is then placed in the third pot and boiled twice. The acid from the last five boilings is poured or run off into reservoirs on the floor, and is used again as a portion for fresh granulations.

The gold is then placed in a washing-tub, where it is washed once with cold and twice with warm water; this water is poured into the washing-tub, from which, on settling, the solution is run into a large tank on the floor below.

(3.) Treatment of the Gold Residue.

The gold is now emptied into one of the filters, washed thoroughly with warm water till it becomes "sweet," and then drained. It is then boiled in two charges of acid for four hours, and again washed and sweetened. (When it is desired to make very fine metal this process is repeated.) It is then thoroughly drained and pressed into cakes by a hydraulic press.

(4.) Melting and Refining the Gold.

After the gold residue is pressed into cakes, these are placed in an oven and dried. They are then taken to the melting room, where they are broken up and placed in a graphite crucible, fluxed from three to five hours, and run into bars, varying from 997½ to 998½ thousandths in fineness.

(5.) Treatment of the Silver—The Reduction of the Silver.

There are for this operation four reducing vats, two concentrating vats, eight crystallizing

vats, and three filters, two ft. nine inches in diameter by 19 inches deep, with a space below. Two tanks on a high platform receive the washings from this gold.

The size of the reducing, concentrating, and crystallizing vats varies, on account of having to accommodate them to a given space.

The vats and tanks are made of wood and lined with heavy sheet lead. The reducing and concentrating vats are heated by a system of coils of lead pipe, through which steam passes. These vats are enclosed, and connected by a flue with the stack.

Before the sulphate of silver is run into the vats, ingots or bars of copper are placed on end around the sides and bottoms, next to the heating coils. The solution is then run in. A sufficient amount of water, together with the weak solution obtained in washing the gold, is added, to reduce the strength of the solution to 15° to 25° Baume., which has been found to facilitate the reduction. The sulphuric acid leaving the silver to attack the copper, the silver is precipitated or deposited as metallic silver. It requires from five to six hours boiling to complete the reduction.

The resulting copper solution is run off through a filter into a concentrating vat. The silver remaining on the copper bars is scraped off, and the whole is put in a filter. Copper hoes and shovels are used in the handling of the silver. About two hours' washing with warm water is required to "sweeten" the silver. It is then drained in the draining boxes, pressed into cakes by the hydraulic press, and dried in an oven similar to that used for the gold.

When silver containing little or no gold is operated upon, 350 lbs. of granulations are dissolved in one pot. With baser metals, the charge of granulations is reduced; copper requiring much more acid to dissolve it than silver.

(6.) Melting and Refining the Silver.

The cakes are broken up and placed in graphite crucibles, and fluxed with nitrate of soda, borax, bone ash, and a little soda ash. These re-agents absorb the little base metal which remains, as the sulphate, in washing. From four to six hours are required for fluxing. The silver is then cast into bars of 998½ to 999½ thousandths fine.

(7.) Treatment of the Sulphate of Copper.

The solution of copper being run into the concentrating vats, is boiled until it reaches the strength of 40° Baume. It is then run into the crystallizing vats. In several days the crystals are formed and the mother liquor is run off into the large tank on the floor below, from whence it is run into the carboys or tanks of its purchasers.

The crystals of sulphate of copper are taken from the sides and bottom of the vats and drained. They are then dissolved in water and run back into the crystallizing vats at a strength of 32° to 34° Baume. The sulphate of copper again crystallizes, and the mother liquor is put back into the concentrating vats. The crystals are then taken from the vats, dried, put into barrels and sold.

If lead is present to any extent in the bullion, it is removed by cupellation before it is granulated.

The consumption of copper is greatly economized in the reduction of silver by melting silver deposits free from gold and under, say, 400 fine with the copper used for that purpose. The silver in them is thus obtained pure without a direct parting, the copper alloy taking the place of that amount of the purchased metal that would otherwise be used.

The form and size of much of the apparatus used, were determined not only by the size of the space that could be utilized, but by the necessity of harmonizing the introduction of each stage of the sulphuric with the nitric acid process, until it was clearly seen by actual experiment that the former was rational as well as superior to the latter.

The proceeds of the sale of the sulphate of copper crystals and the liquor, nearly cover the total expense of the acid and bar copper bought.

All the wood used, after it becomes useless, is burnt. The old, unserviceable crucibles are broken up and ground. (The grains obtained from them are melted and treated as before.) It is then put through a rough washing and amalgamation process, the resulting tailings being dried, assayed, barreled and sold to sweep smelters.

TESTING FOR ACID IN OILS.—The oil is mixed with two or three times its volume of ether, or, if it is a solid grease, dissolved entirely in this liquid. A drop of alcoholic solution of rosolic acid is then added, and the solution tested with a standard solution of caustic potash, the liquid being kept in movement during the whole time. The slightest excess of alkali produces the well known magnificent red color which indicates the termination of the test.—*Geissler*.

PRIZE FOR SCIENTIFIC RESEARCH.—The Vienna Academy of Science proposes as the subject for the Baumgartner prize of 1,000 florins, the microscopic investigation of the wood of living and fossil plants, in order to ascertain whether it is possible to determine with certainty from the examination of the microscopic sections what the genus and species of the plant may have been from which they were taken.

The Beginning of Rail Manufacture in the United States.

The great railway interest has assumed such vast proportions in the United States—where, according to Poor's last volume, there are 41% of the railways of the world—that every incident in its growth and progress possesses general interest. There was, not long since, printed in the *New York World*, an account of the beginning of the manufacture of rails in this country, of which we present a summary:

The first T-rail laid on a railroad in the United States was imported from England by the Erie Railway Co.—then the New York and Erie—in 1845, and the first rail of that kind ever made in this country was manufactured for that company in 1846 by the Lackawanna Iron Works of Harrison, Pa., now the city of Scranton. The recent resignation of W. W. Scranton from the general management of the Lackawanna Coal and Iron Co., which is the Lackawanna Iron Works of 1846, recalls a series of incidents in the early history of the Erie road and of the iron works by which the pioneer of trunk roads in America was saved from bankruptcy and the forfeiture of its franchises to the State of New York, and the struggling iron manufacturer was enabled to raise itself from insignificant proportions and impending ruin to be the most wealthy and powerful corporation of its kind in the country.

Work was begun on the New York and Erie railway in 1835, but the financial revulsion of 1837 forced the suspension of operations. In 1838 the State of New York aided the company by its credit to the amount of \$3,000,000. This sum was expended, and only 61 miles of the road were completed up to 1845. The original idea of the engineers was that the rails must be laid on piles to have a solid and even foundation; and for 90 miles westward from Owego two miles of posts were actually sunk. This ridiculous proceeding not only absorbed a large part of the company's funds, but wasted valuable time. The State was anxious to have the important work of connecting the great lakes with the ocean by a line of rails completed, and again came to the aid of the company. An act was passed by which the company was relieved of the claim of the State for the loan of \$3,000,000, and such substantial aid was extended that the company was enabled to resume the construction of its road with a well-filled treasury. By the act the company had four years in which to complete 137 miles of road between Piermont and Binghamton; otherwise it should be forfeited to the State.

In 1843 Geo. W. and Selden T. Scranton established a nail factory and rolling mill at the small village of Harrison, Pa., a part of the Lackawanna valley then almost entirely undeveloped. The Delaware and Hudson Canal Co. had opened coal mines in the upper part of the valley, and had founded several villages. Their now-famous gravity railroad—the first railroad for actual transportation in the United States—extended from Archibald, nine miles north of Harrison, to Honesdale, the head of the company's canal. The works of the Scranton Bros., sustained by meager capital and opposed by local prejudice, struggled along for three years, and bankruptcy seemed inevitable. In 1846, however, they determined to either assure the future by a bold stroke or go down in the effort. They knew that the Erie Railway Co. was obliged to pay \$80 per ton for English rails, and that in the face of its straitened circumstances and the limit imposed by the State for finishing the road to Binghamton, it must obtain rails at cheaper rates and more speedily than the foreign article could be furnished. The Scrantons boldly resolved to venture on the manufacture of rails at their works. They suggested the idea to a number of capitalists who were deeply interested in the Erie road, and these gentlemen agreed to advance to them \$100,000, in order to enable them to buy the necessary machinery, with no security but their word of honor. A contract was made by which the Lackawanna Iron Works agreed to furnish the Erie Co. with 12,000 tons of rails at a rate much less than the English iron cost to be delivered at Lackawanna, Pike county, Pa., during the years 1847-8. It required several months to fit the works with the furnaces and machinery, which were hauled by teams more than 60 miles over the most primitive of mountain roads.

The first rails were turned out by the Brothers Scranton in the latter part of 1846. As fast as the iron was ready it was sent in wagons to Archibald, where it was loaded on the cars of the Delaware and Hudson's gravity road. By these it was carried to Honesdale over the Moosic mountains and transferred to canal boats, which delivered it to the company at Lackawanna. The first 1,500 tons were taken to Port Jervis, N. Y., by canal, and the track between that place and Otisville, the western terminus was laid. Everything worked smoothly until it was attempted to carry the road across the Delaware from Port Jervis into Pike county, Pa., where serious trouble arose.

It was the original intention that the line should cross into Pennsylvania at Matamoras, nearly opposite Port Jervis, but the route was found to be impracticable. The Erie company, therefore, fixed on a point for crossing the river three miles above Matamoras, but it was met by an injunction from the Milford and Matamoras Co., which had been chartered by Penn-

sylvania. The work on the Erie road was stopped, and this delay threatened to prove fatal to the completion of the line to Binghamton in the stipulated time. Finally the difficulty was compromised. The unfortunate delay in the work made it necessary for the iron company to distribute the rails at the different points along this route. Roads had to be cut through dense forests. Over 400 mules and horses were required, as many as 10 span frequently being attached to one wagon. The rails were simultaneously laid east and west from the points named, and only five days before the stipulated time for the completion of the road to Binghamton had expired, the last spike was driven. At the celebration of the event in 1848, President Benjamin Loder declared that the energy and enterprise of the Brothers Scranton had saved the New York and Erie railway to the company.

The contract was a profitable one to the iron works. It laid the foundation for the city of Scranton. It led to the building of the Delaware, Lackawanna and Western railroad and to the Pennsylvania Coal Co.'s railroad in the Lackawanna valley and to the great coal development that followed. It brought more than \$250,000,000 capital into the valley, and made of the tottering Lackawanna Iron Works the rich and powerful Lackawanna Coal and Iron Co., the iron and steel and mining industries of which to-day give employment to 3,000 men.

Lead Fumes.

Lead fume or smoke is formed, partly mechanically, when fine particles of ore at the moment of their transformation into carbonate and sulphate of lead come into contact with the hot gases during the charging of the furnaces, and during the roasting process. It is also formed by the volatilization of metallic lead during the second period. The fumes consist, usually of oxide, carbonate and a little sulphide of lead, with more or less silver, which is volatile at very high temperatures.

The formation of lead fumes is so considerable that they are collected in suitable condensation flues and chambers, and then re-worked. The following analyses, which we take from Crooke's & Rohrig's metallurgy, show the composition of different kinds of lead smoke.

	PbO	As	Fe ₂	Zn	PbO	Pb	Al ₂	Si
	SO ₃	O ₂	O ₃	CO ₂	S	O ₃	O ₃	O ₃
1	11.0	69.0	2.0	12.0	15.0	13.2
2	...	39.0	1.5	...	2.7	35.0	4.5	...
3	10.2	65.6	...	3.4	13.8	...	1.4	...
4	42.5	39.0	17.4
5	71.2	trace	7.2

In these analyses 1 was smoke from a roasting reverberatory furnace at Pontgibaud, the analysis being made by Berthier; No. 2 was the same, by Rivot; No. 3 the same of Alston Moor, by Berthier; No. 4 was fused lead smoke of Conlaux, by Berthier; No. 5 was oaked smoke from the chimney of the reverberatory furnace at Redruth, by Berthier. In addition, No. 2 contained 2.3% of ZnO SO₃; and No. 5 contained 0.2% of copper.

According to Rivot, the smoke of schlich smelting furnaces, at the Upper Hartz, contained the following sulphureted substances: 2.5% of C; 7.8% of S; 0.5% of As and Sb; 34.8% of Pb; 1.0% of Fe; and 1.0% of Zn. It also contained the following oxidized substances: 7.7% of CO₂ and O; 2.5% of As and Sb; 2.8% of SO₃; 2.9% of PbO, SiO₂; 18.0% of PbO; 1.5% of ZnO; 4.5% of Fe₂O₃; and 12.3% of SiO₂ and BaO, SO₃.

Kerl tells us that from the schlich smelting at Clausthal and Altenau, 7% or 8% of smoke, result; at Lautenthal, 10% or 11% and at Andreasberg, 0.8% to 1%. This smoke is smelted together with dressed scum containing 0.10 to 0.03 lb. of silver, and from 35% to 40% of lead, in schlich furnace, when combined in the following way:

At Clausthal, 36 cwts. of smoke, 9 cwts. of scum, 12 cwts. of roasted matte of the smoke smelting, 3 cwts. of iron, 5 cwts. of plumbiferous fluxes, 45 cwts. of schlich slag, and 6 cwts. of hard lead slag. At Altenau 54 cwts. of smoke, 18 cwts. of scum, 13 cwts. of roasted matte of the smoke smelting, 4 cwts. of iron, 3 cwts. of plumbiferous fluxes, 28 cwts. of schlich slag, and 20 cwts. of matte slag. At Lautenthal 30 cwts. of smoke, 6 cwts. of scum, 2 cwts. of iron, 6 cwts. of plumbiferous fluxes, 26 cwts. of schlich slag, and 20 cwts. of matte slags. At Andreasberg, 36 cwts. of smoke and scum, 2 cwts. of iron, 12 cwts. of plumbiferous products, and 73 cwts. of matte slags.

The consumption of coal at Clausthal amounts to 230 cubic ft.; at Altenau to 350 cubic ft.; at Lautenthal to 186 cubic ft.; and at Andreasberg to 250 cubic ft. The yield of raw lead at Clausthal is from 16 to 20 cwts.; at Altenau to 18 cwts.; and at Lautenthal to from 11 to 12 cwts.; and that of matte at Clausthal to from 16 to 19 cwts.; at Altenau from 18 to 19 cwts.; and at Lautenthal to from 12 to 13 cwts. Even after all this work, 11% of the lead fumes escape reduction by being again volatilized during the smelting.

In Deadwood district, Trinity county, on the Brown Bear mine, a number of men are at work grading the site for a mill. A 20-stamp mill with steam power will be erected,

Rainfall and Temperature in California.

The "climate of California" is a subject upon which all good citizens of the State consider themselves perfectly qualified to speak with

authority; and it seems a point of honor to speak of it always with praise. Yet if residents of different parts of the State enter into a discussion of details they never fail to disagree. It is the old story of the Knights of the

Shield. From different points of view different aspects are presented.

And this should impress us with the fact that the subject is not as well understood as it might be, and that there are widely varying

conditions at different points. Climate is "the condition of a place in relation to the various phenomena of the atmosphere, as temperature, moisture, etc., especially as they affect animal life or man." In view of this definition it is

Delano.....	35° 43'	119° 12'	313	1875-77	4.03
Sumner.....	35° 23'	118° 58'	415	1875-77	3.92

The proposition that the mountains should receive more rain than the valleys is also confirmed by the following exhibit, wherein have been selected successive stations on a line as nearly as possible east from San Francisco, thereby avoiding any increase of precipitation due to increase of latitude. The law, as stated by Guyot, deduced from experiment and observation, is that an elevation of 350 ft. is sufficient to diminish the mean temperature of a given place by 1° of Fahrenheit; that is to say, the effect is the same as if the place were situated 70 miles farther north.

Commencing near the center of the Sacramento valley, at the lowest elevation above the sea, the following results are shown:

Stations.	Latitude.	Longitude.	Height above the sea—feet.	Extent of series.	Annual mean of rain in inches.
Stockton.....	37° 57'	121° 17'	23	1854-57	13.23
Sacramento.....	38° 34'	121° 28'	30	1849-77	18.75
Rocklin.....	38° 45'	121° 12'	249	1870-77	17.30
Auburn.....	38° 52'	121° 02'	1363	1870-77	20.70
Colfax.....	39° 08'	120° 55'	2421	1870-77	42.72
Alta.....	39° 12'	120° 52'	3612	1870-77	47.32
Emigrant Gap.....	39° 18'	120° 35'	5220	1870-77	51.49
Cisco.....	39° 10'	120° 28'	5938	1870-77	55.32
Summit.....	39° 20'	120° 15'	7019	1870-77	58.48

That the least rain should be in the deserts, is confirmed by the records kept at various stations.

Commencing south and proceeding north, the following statement is shown:

Stations.	Latitude.	Longitude.	Height above the sea—feet.	Extent of series.	Annual mean of rain in inches.
Fort Yuma.....	32° 44'	114° 36'	200	1855-57	3.06
Fort Mohave.....	35° 06'	114° 35'	604	1859-66	9.65
Wadsworth.....	39° 42'	119° 15'	4077	1870-77	3.21
Hot Springs.....	39° 51'	119° 02'	4070	1870-77	3.90
Brown's.....	40° 00'	118° 35'	3925	1870-77	3.53

To exhibit the fact that the rainfall is more on the coast than in the Sacramento and San Joaquin valleys, in the same latitudes, a series of stations near the coast, south of this city, was located.

Stations.	Latitude.	Longitude.	Height above ocean—feet.	Extent of series.	Annual mean of rain in inches.
San Mateo.....	37° 34'	122° 18'	30	1873-77	15.74
San Jose.....	37° 20'	121° 52'	94	1873-77	10.24
Gilroy.....	37°	121° 31'	201	1873-77	16.45
Hollister.....	36° 50'	121° 23'	299	1873-77	9.66
Pajaro.....	36° 55'	121° 43'	31	1873-77	15.46
Salinas.....	36° 35'	121° 46'	52	1873-77	10.74
Monterey.....	36° 36'	121° 52'	42	1860-65	15.29
Soledad.....	36° 15'	121° 21'	188	1873-77	8.07

San Mateo and Modesto are nearly in the same latitude. Modesto has an annual mean of 9.60 inches of rain, while San Mateo has 15.74. San Jose and Merced are in the same latitude; the former has 10.24 inches, the latter 9.36 inches. As we go farther south the discrepancy between the coast and interior valleys is still more marked. Soledad and Tulare have the same latitude. Soledad gets a mean of 8.07 inches; Tulare, 4.83 inches.

The influence of the prevailing wind is very great. Coming south through the center of the Sacramento valley, from Redding on the north to Sumner on the extreme south, the mean temperatures of the various successive stations show the effect of the radiation of heat in this valley and the influence of the wind from the cool gulf stream where it flows through the Golden Gate and up the Sacramento river.

The following is the mean annual temperature of

Redding.....	61.14°	Modesto.....	63.68°
Red Bluff.....	60.22°	Merced.....	63.10°
Chico.....	62.40°	Borden.....	66.37°
Marysville.....	63.62°	Tulare.....	64.00°
Sacramento.....	60.48°	Delano.....	63.64°

Silver in Sandstone.

When, a few years ago, it was announced that silver had been found in sandstone formation, at Silver Reef, Utah, very few people believed that the find would amount to anything. Many so-called experts said it was nonsense to expect anything of the kind in such a formation, and, in fact it couldn't be possible. It was, geologically speaking, not only an improbability but an impossibility. It was found, however, practically speaking, not only to be a possibility, but a fact, and one very well evidenced on the "proof of the pudding" principle. That is, that in November the total bullion shipment of the camp was \$72,996, which is but a continuation of previous regular shipments. As early as May, 1875, a few men prospected in the camp, but left disgusted. Judge Barbee then came along, later in the year, went away, returned and prospected further. In December he shipped his first ore, and a little while after another shipment was made, for which he received \$7,000. He finally realized from ore, \$17,000 from Salt Lake smelter and \$23,000 from Pioche mills.

His district then began to attract attention, and in 1877 the Leeds mill was built; and also the Stormont and Pioneer mills. In 1878 the Christy, and Barbee & Walker mills were built. The camp is now a very prosperous one.

At a late meeting of the American Institute of Mining Engineers, Mr. Charles M. Rolker, of New York, read a paper describing this sandstone district in detail. From this paper, of which we have received advance sheets, subject to revision, we have taken the liberty of extracting such parts as are of general interest. In doing this, to accommodate it to our space, we have necessarily omitted a great deal of matter, but have endeavored to present the prominent features of the writer's description.

The remarkable district under consideration lies about 320 miles south of Salt Lake City, in Washington county, near the Arizona border. It is now reached by the Utah Southern railroad and its extension, and the last 100 miles are run by stages. Arriving at Silver Reef, the main camp of the district, one sees at once that he stands where once a surging sea had its domain, marked now by heavy sandstone deposits of a red and white color. The town itself, a neat, clean and orderly mining town, is encircled on the north by trachyte and granite mountains, skirting to the west. They are cut through in places by deep gorges, left us as the only trace of the force of former currents, which drained the adjoining territory to the north; and which, when swelled and infuriated by tempests and cloud-bursts, took in their grasp huge blocks of granite and trachyte, which now lie scattered about as boulders, to the north, west, and east of the town. At the base of these encircling mountains lies

A Belt of Dull, Brick-red Sandstone, Over 1,000 ft. thick. Its extent is seen on the west side of town, and its trend is for over 30 miles to the south. Following the northern sandstone arc, it flanks to the east and south, gradually sinking into the ground until the volcanic lava caps, and nearly covers it, leaving protruding masses like frowning rocks in a fiery sea. The whole belt takes the shape of a horseshoe. Back of these red sandstones, on the east and northeast, high sandstone tablelands extend, of variegated colors, from white, to gray, to yellow, beautifully banded, looking in the distance like formidable castles; a romantic picture in the glow of a setting sun.

Turning to the south of the town, we see a sandstone hill, about 1½ miles distant, which, through the action of volcanic forces, stands now boldly several hundred feet above the town's plateau. Underlying, as it formerly did, the surrounding sandstone country, it has since acted as a central wedge, around which the other strata have been grouped. Conformable to its east and west slopes, we see the strata dipping east and west, with a varying inclination of from 15° to 35°, striking in a northeast and southwest direction. On either side of this wedge we find a series of superimposed sandstones. These white sandstones being harder have withstood the weathering action better than the softer underlying shales, and their strike is clearly marked by protruding ribs or reefs, the intervening shales being washed or carried away to a depth of over 100 ft., forming a valley. Of these reefs we note three: the White, the Buckeye, and the Butts reef, overlying each other in the sequence named. Like the red sandstone before mentioned, which has the shape of a horseshoe with the open side on the south, so these reefs are grouped uniformly about the wedge above mentioned.

As to the age of the sandstones, little can be said with certainty, since so far no characteristic fossils have been found in them. Reeds and rushes are plentiful, but no leaf or shell has been traced to this locality.

The Reefs Themselves

Are made up of whitish-gray and red to reddish-brown sandstones, and between the reefs lie beds of clay shale, varying in color from blue to green to cinnamon brown. The ore occurs in similar strata of sandstone and clay shale. The reef is generally marked by a reddish micaceous sandstone, while the floor is made up of an arenaceous sandstone of a whitish color, with argillaceous sands underlying. The outcrop of the ore is marked on the east face of the reef, with the exception of those places where

off, as in portions of the Buckeye reef on its northwest side of the horseshoe. The ore is by no means confined always to one bed, but is limited to a silver zone of from 30 to 90 ft. wide, horizontally measured, and anywhere within this belt the horn-silver is liable to be found. As a rule it is more concentrated in certain layers (beds) of this belt, but in places it is so scattered as to bring the grade down to a uniform \$10, which at present does not pay to work. Frequently, also, the ore is thrown, in consequence of very fine slips, from one bed into another. Hence the giving out of the ore in one bed is not exactly a discouraging fact, for a cross-cut may, and very often does, prove it to have jumped into a lower or higher bed respectively. In other words, the argilliferous Sandstone Belt is Compound in Structure. The producing branches, two or three in number, run together in places, at least two of them do, and then again continue for long distances with barren strata between, which vary in thickness from 3 to 15 and even 30 ft. or more. In this depth, or following this dip, they have kept pretty well their own ground, but I have no doubt that what is now considered two and three separate beds will at a greater depth form but one bed throughout. The producing branches in all the mines change occasionally from a sandstone to a clay shale, even in the same bed, but certain portions of the reef show a preponderance of clay shale and argillaceous sandstone.

Of course the less clayish or argillaceous the sandstones, the less slimes are produced in the mill. The southern and part of the middle portion of the Buckeye reef, show less frequently vegetable remains than the remaining portion and the White reef, and in parts these remains are absent. In other parts, and this holds true for the whole district, we find the producing sandstone beds underlain by a stratum of highly argillaceous sandstones of variable thickness of from 10 inches to 2 ft., which carry much silver, and frequently show solid sheets of horn-silver along the seams of the thickness of a knife blade. I have known such seams to mill right along \$60 to \$130; unfortunately their occurrence is not as frequent as might be wished.

The Ore Itself

Is what is known as cerargyrite or chloride of silver, which, however, below true water-level will change to the sulphuret of silver, with native silver in places. Of the latter, two indications have been met with. A tested sample yielded in a certain mine only 65% of chloride of silver. This proportion will decrease in the ratio as water-level is passed, and the ore gets more outside of the reach of waters charged with oxygen and chloride of sodium. The grade of the camp is probably \$20 to \$25, though I have mined portions of beds which averaged right along \$35 to \$55, and others run as low as \$14 to \$17; and at times even \$8 and \$10. This question of

How the Silver Came into the Sandstone Has been discussed quite frequently in the camp, as may be imagined, and also among experts. The theory of contemporaneous deposition is held by some, while others hold that it has been deposited from ascending mineral solutions or vapors. I advocate the latter theory. I admit, at the first glance, one may be inclined to assume a contemporaneous deposition, inasmuch as the rushes and reeds coated and partially replaced with horn-silver, are plentiful, and a cursory examination may show in certain localities the silver to be confined solely to places where we find organic remains. However, such is not the case, taking the district as a whole. I have seen and mined portions in these beds, for a stretch of 200 consecutive feet, which were really absolutely void to the eye of organic remains, and still milled an average of say \$30; in spots as low as \$20 and as high as \$45 and \$53.

But grant for a moment that the silver was deposited contemporaneously with the sandstones. The first question to present itself would be, how did the silver get into the former sea?

From What Source did the Silver Come?

The surrounding border mountains have so far not been so kind to the prospector as to reveal any source of silver, and farther north we find either gold or lead mixed with ores containing silver. Now, then, if the silver was dissolved by the waters, and precipitated by the decomposing vegetable remains, why not the lead and the gold, of which no trace is to be found? Why is the silver limited to zones, outside of which no silver can be found? By this theory the silver should occur indiscriminately over a large area instead of being confined to limited belts, in close proximity to former volcanic centers, as at the reef, and in the district near Virgin City, upon North creek, a locality less known. Farther south we find the same beds carrying copper ores in rich quantities, a fact hard to explain under the theory of contemporaneous precipitation from above. The perfect and distinct occurrence of ore chutes, in the different producing beds, one chute underlying the other and separated respectively by 4 and again 30 ft. of barren rock, is likewise hard to explain by this theory. I refer to a certain instance in the Buckeye mine, near the Gad shaft, where there are three distinct producing branches, the top one being separated from the second one by 4 ft. of barren rock, and the second one from the third one by 30 ft. of unproductive ground, with a well-marked chute in each, one overlying the other.

In one locality should be at one time charged with silver so as to deposit argentiferous rock, and then, again, free from silver and deposit barren rock, as would be indicated on the theory of contemporaneous deposition by the alternations just mentioned.

We find in the same line of bedding, strata holding petrifications from 6 inches to 3 ft. thick, which contain no silver ore, while above and below it silver is found in good permanent grades in strata showing a scarcity of vegetable remains. Again, I have seen a stratum where the upper 2 ft. assayed about \$30, then 6 inches assaying \$100 or more, then 15 inches barren, and below it a layer of \$20 rock, all of the strata being full of petrifications.

From these and other facts, I form my opinion that the sandstones and silver have not been deposited at the same time, nor the ore deposited by precipitation from metallic solutions passing in from above, after the sandstones had been tilted.

At the time of the Volcanic Disturbance,

Metallic solutions, probably accompanied by steam and vapors, ascended from below and percolated through these sandstone beds, which at that time were most porous. The pressure decreasing, the vegetable remains in some parts, ferruginous masses in others, precipitated the sulphurets of silver (and copper in places), while at other points the silver was no doubt deposited by evaporation, as neither of the two precipitants is found. The upper portions, now changed to chlorides, are the result of surface waters, charged with oxygen and chloride of sodium, and the native silver found in places is the result of decomposition of the sulphurets. As at Steamboat springs to-day, where thirteen distinct openings (springs), emit steam and metallic vapors, at variable distances from each other, so did we have in those days different channels, which are now marked by the pay chutes. We can thus easily see how, according to the hardness and compactness of the sandstone beds, the solution percolated, 4 and 30 ft. apart, in the same direction, forming three ore chutes one under the other, or how the productive branches ran together and diverged again. As the thermal waters under pressure coursed through the lower strata of the earth, dissolving the silver from those rocks, portions of copper were dissolved with it from adjoining zones which gave rise probably to the copper deposits farther south. In places along this reef, the waters carried more copper in solution than in others, and through some molecular attraction, it seems as if the copper has more or less limited itself to certain permeable sand beds, while the silver has gone to the adjacent bed, according to the mechanical condition of the rocks, and no doubt the chemical nature of the precipitating agent. In places where the quantity of copper was but small in the ascending waters it has been deposited in the same bed with the silver. As to the occurrence of

Copper in the Silver Bed

I have observed a curious fact. If the copper present be azurite, or a grassy-green-looking malachite, the amount of silver in the bed will diminish, and it is a bad indication for the life of this particular chute. If the copper presents, however, a pale, but lively green, with a bluish shade in it, as we often find the stain on quartz ores, it invariably improves the grades of the silver ore. You may call it "kind" and "unkind" copper. I substantiated this on both reefs, and the trained eye will tell it at a glance.

Other objects of interest in the beds are occasional pieces of

Vegetable Matter Changed into Lignite.

Some of which will assay high in silver, and others again be free from it. They are, in instances, coated with native silver, and also intergrown in cases with pyrites, holding a very small amount of copper. In places trunks and branches of trees are found, some of which assay well, while others do not. The silver is not alone limited to the outside bark, but I tried pieces from the very interior of such branches, which I carefully washed and scrubbed, and they yielded as high as \$40 in silver. I also noticed, in the Buckeye reef, a six-inch seam of jasper, resting between sandstone and clay shale.

Cost of Working the Ores.

High milling charges and royalties have been drawbacks in the early days of the camp to the poor prospector, and the present regular rates could be well reduced, namely, 80% of assay value, 20% discount, and \$12 per ton for milling; returning only \$52 from a \$100 ore. In instances of big lots, the \$12 charge has been reduced to \$10 and \$9. Mill assay govern of course.

The bullion produced by the camp was, up to June 1st, 1880, according to Wells, Fargo & Co.'s receipts, 2,755,247 ounces of fine silver. To this ought to be added the value of the bullion produced from the ore at Salt Lake City and Pioche.

Taking the camp as a whole, it shows very well indeed, and it must be ranked among our good camps. If the companies now operating there will work their mines legitimately and systematically, the camp will continue to be for a long time yet, what it is to-day, a sure and steady bullion producer.

The richness of the cinabar obtained from the new strike in the Sulphur Bank mine, Lake

TONITE

PATENT SMOKELESS BLASTING POWDER.

This Powder has been in use in England for five years, and its consumption has steadily increased; the sales this year being quite 25 per cent. more than in 1879. It has given the greatest satisfaction, and wherever it has received a trial, it is preferred to any of the other high explosives on the market, on account of its remarkable merits, which will be even more highly appreciated on this coast than in England, owing to the greater extremes of heat and cold in our Mining Districts.

IT DOES NOT **FREEZE**.

IT DOES NOT **DETERIORATE** WHEN KEPT IN **HOT PLACES**.

IT DOES NOT GIVE OFF **NOXIOUS FUMES**.

IT CAN BE BURNED LIKE A TORCH IN DRIFTS, TUNNELS, ETC., WITHOUT CAUSING THE MINERS WORKING THERE ANY INCONVENIENCE; ON THE CONTRARY, IT FURNISHES A LIGHT OF GREAT BEAUTY AND INTENSITY.

IT DOES NOT CONTAIN NITRO-GLYCERINE, CHLORATE OF POTASH, SULPHUR, PICRIC ACID, NOR ANY OTHER SUBSTANCE WHICH EXPLODES BY FRICTION, HENCE IT CAN BE CONSIDERED THE SAFEST BLASTING POWDER IN USE, YET WHEN PROPERLY DETONATED IT HAS NO SUPERIOR IN STRENGTH.

WHILE TONITE CAN CONFIDENTLY BE RECOMMENDED FOR ITS SAFETY IN TRANSIT, STORAGE AND ORDINARY HANDLING (NO ACCIDENT HAVING OCCURRED WITH IT). THE FACT THAT IT IS A VERY POWERFUL EXPLOSIVE SHOULD NOT BE OVERLOOKED.

TONITE IS ALLOWED TO BE TRANSPORTED OVER THE RAILWAYS OF GREAT BRITAIN, A PRIVILEGE NOT EXTENDED TO ANY OTHER HIGH EXPLOSIVE.

The Company manufactures besides Tonite and Detonators, also the ETNA CAP, which is superior to any other in the market for exploding Nitro-Glycerine and other Powders. Also the Patent Socket Distress and Alarm Ship-Signals; also, Fog Signals, Torpedoes, Rockets without sticks, etc. Tonite is destined to supersede Nitro-Glycerine Powders as surely as they have superseded common gun-powder, as the miners will quickly appreciate the value of an explosive, which, while as strong as Giant Powder, gives off no noxious fumes, does not Freeze, does not lose its Strength with age, and is much safer to handle. In offering this "explosive of the future," as it has been called by prominent scientists in Europe, we ask consumers for a share of their patronage, and a chance to prove our assertion.

STEIGER & KERR'S

CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adapted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

PERMANENT BEER TAP.

This Tap can be used in any keg. Or be regulated to draw Steam or Flat Beer, and is self-locking when the key is taken out.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

DUNHAM, CARRIGAN & CO.,

LIGHTNING SCREW PLATES

WITH TAPS, DIES AND COLLETS COMPLETE.

B, Stock 23 inches long, 7 Taps and Dies Cuts $\frac{1}{4}$ to $\frac{3}{4}$ inch.

CLAYTON STEAM PUMP WORKS

Sierra County Drift Mines.

Both Sierra and Plumas counties are noted for their rich drift mines. The gravel deposits in these counties have in places yielded fabulous sums. Many of these deposits have been worked out, but there yet remain large tracts of land untouched by the miner. The little map presented beneath represents a section in the northwestern part of Sierra county which, though comparatively limited in extent, has at different times yielded millions of dollars. The section shown covers an area of about 10 square miles, yet it is credited with having produced in gold \$145,000,000. La Porte (which is in Plumas Co.) is supposed to have yielded from \$11,000,000 to \$13,000,000; Gibsonville, about \$8,000,000; Port Wine, \$10,000,000; Morristown and Craig's Flat, about \$7,000,000; Grizzly and Deadwood, \$3,000,000; Monte Cristo and Fur Cap, \$2,500,000; Eureka about \$3,000,000, and Sawpit Flat about \$3,000,000. It will be seen that this section has been exceedingly rich.

There yet remain several ridges satirically unprospected. These are, the Eureka, about seven miles long, between Canyon creek and Yuba river; Gibsonville, from La Porte to Gibsonville, eight miles. This latter is between Slate creek and South Feather river. The Union Valley ridge, six miles long, is between Onion Valley creek and South Feather. Gravel is known to exist there. Then there is Fowler's ridge, four miles long, between the headwaters of Dogwood (or the main Feather) and Black Rock. This has not been prospected.

A Chicago company has bought up the Gibsonville ridge from La Porte up three miles; and Hamilton Smith, Jr., and others, have bonds on the others from there to Gibsonville.

The Chicago Co. intend to begin work as soon as the snow is off. Another Chicago company (called the Blue Gravel Co.) has a bond on the Onion Valley ridge from the Pilot peak down, between Pilot peak and Grass Valley, Plumas Co., 743 acres in all. There have been developments already made, which has convinced everyone what there is there. They are said to have as good gravel as has been found in the northern country. A New York Co. is being formed to open the divide between Dogwood and Black Rock. They have over three miles of old river channel—2,000 acres. This Chicago Co. at La Porte is called the Bald Mt. Con. Co.; and they are preparing to commence operations as soon as the snow is off. The noted Monte Cristo mine at Spanish peak, owned by a Chicago Co., is paying very largely now.

There are many mines there which were supposed to have been worked out, which have been found, on further exploration, to contain plenty of gold. The Niagara, formerly called the North American, at Whisky diggings, has developed a channel running clean through the ridge to Hopkins' creek. They have begun on the other side to come back. This mine was bought by an English Co., who paid \$400,000 for it, and then sold it for about \$60,000, because they did not make anything out of it. Since then, the new owners have made a large amount of money out of it, and have only lately discovered that they have a big channel, and yet the mine has been worked over 16 years. The Empire, at Howland Flat, paid \$465,000 in dividends in four years, from a small strip of ground. The Bonanza, which joins the Empire, is said to be taking out gravel worth \$20 per carload. The Virginia, next to the Bonanza, is also getting out rich gravel. At the Pioneer and Gardner's Point they have had 300 men at work this summer, bringing in the water from St. Louis, it being brought across Cedar Grove ravine in a 34-inch pipe. They expect to run six monitors. The tunnel was owned by Chapman & Ralston originally. Work was stopped for want of money. Now they have raised up from the tunnel, and will drop gravel through this shaft and sluice through the tunnel. They are probably washing by this time.

The Pliocene Consolidated mine consists of over 6,000 acres of hydraulic mining ground, all owned by the Union Investment Co., of New York. This includes the mines at La Porte, Grass Valley, Spanish Flat, Bernard diggings, Spook's Point, Morristown and Craig's Flat. They have about 16,000 inches of water during the season, and are running over a dozen monitors. They have been working 300 men for two months past, till snow came. This Pliocene Co. are going to bring more water in by bringing the South Feather river through a tunnel under the Gibsonville ridge. The tunnel is to be 4,400 ft. long, and

about 2,100 ft. have been already cut. This and the Gardner's Point Co. will be the leading enterprises of this whole northern country.

Among the projected enterprises now being inaugurated is one called the Blue Gravel Consolidated, which consists of 4 locations, embracing a tract of something over 400 acres. It is on the well-known divide between the headwaters of the North Yuba and Big and Little Canyon creeks and covering about two miles of the old river bed, or ancient channel, which has been worked on both sides of their claims very successfully for years past.

The claims, as the map shows, are about three miles southwesterly from Table Rock, or Howland's Flat, and about the same distance northeasterly from the well-known Monte Cristo and Fur Cap mines. They are about two miles easterly from Morristown, Craig's Flat and Eureka North. The claims are entirely in virgin ground, and can be opened at three points, viz: from Reese ravine, Little Canyon creek or Saw-mill ravine, either of which are natural outlets for the claims, and all of which were very rich in gold. Saw-mill ravine would be deemed, perhaps, the most feasible, as the channel could be reached through a tunnel about 1,000 to 1,200 ft. long and at a cost of about \$15,000. Water sufficient to work the gravel is obtainable in Reese ravine and others on the claims, the year through, and the tunnel itself would probably afford considerable water for the same purpose. There is an abundance of timber on the claims. The claims can be reached by wagon road over Howland's Flat, five miles distant, and also by trail from La

Bullion Product.

A few weeks since we gave a resume of the work now being performed by the U. S. Mint officials in the collection of statistics, and information relating to the mining of the precious metals. At that time we mentioned that very shortly the figures of the bullion product for some of the States and Territories for this fiscal year had been compiled and would shortly be made public. The returns as given represent the bullion product for the fiscal year ending June 30th, 1880. The figures are as follows:

	Gold.	Silver.	Total.
California.....	\$13,951,618	\$1,045,453	\$14,997,071
Nevada.....	4,719,070	10,553,762	15,272,832
Oregon.....	451,182	983	452,165
Washington.....	410,500		410,500
Idaho.....	1,053,703	444,047	2,497,750
Arizona.....	300,199	2,011,319	2,311,518
Totals.....	\$21,886,272	\$14,358,454	\$36,244,726

It will be seen that these tables do not cover the whole field, the returns being incomplete. Utah, Montana, Colorado and Dakota not appearing. This looks as if our mint officials in San Francisco have worked up their district more carefully than the other people east of the Rockies had done.

The gold reported for California is from 33 counties, and is believed to be \$1,500,000 less than the actual yield. The silver reported comes from 24 counties, and is probably complete. The product for Nevada is the combined yield of the productive mines of 10 counties, and is regarded as very accurate. Seven coun-

Saving Float Gold.

We saw, this week, at Geo. M. Lederer & Co.'s, Bay City Plating Works, 731 Mission street, a very simple but effective device for saving float gold, which has, within the past year, been pretty extensively introduced in the mining regions of this State. It is well understood that in our milling system a certain proportion of the very fine gold is lost, passing away with the tailings. This is known as "float gold," as it floats on the surface of the water and does not, therefore, come in contact with the amalgamated plates or mercury in the sluices. This float gold occurs in places, as well as quartz mines. All sorts of devices, more or less complicated, have been used to prevent the loss.

About a year ago Mr. Lederer, when at Nevada City putting in a set of silver-plated amalgamated plates for the Providence Co., had his attention called to the matter of loss of float gold, and was asked, in a joking way, if he could not provide a remedy. On his return he thought over the matter, made a set of swinging plates and sent up. In two or three days he received an order for a lot of them, and since then has made many hundreds.

This swinging plate consists of a curved strip of silver-plated amalgamated plate, about three inches deep, and the width of the sluice or flume in which it is to be used. It is swung on eyes through which passes a wire rod, resting on the edges of the sluice. The plate thus hangs transversely to the current, with its concave face up stream, the plate being half submerged. The movement of the water will keep the plate swinging. The floating particles of gold cannot escape touching the plate, and are caught on the quicksilver surface.

It is found in practice that across the sluice, immediately under each swinging plate, is formed a line of amalgam, which has dropped from the plate as it accumulated. The gold which is caught on the plates is thus saved. These plates are hung in sluices, a few feet apart. Very wide ones have been made for the sluices of hydraulic mines. The plates cost so little, and are so effective, that they have come into extensive use in a very short time.

Lederer & Co. make a specialty of plating amalgamating plates for saving gold. They prepare their silver-plated copper plates in a different manner from which many do, and guarantee their weight and efficiency. In using common copper plates it takes some time to get them in proper condition; with the silver plated ones, they are ready immediately. They moreover feed themselves with quicksilver from the battery, never corroding, and requiring no handling to be kept clean. As the amalgam gets thick it is removed, and the plate will be kept "alive" from the battery. In fact, the value of silver-plated copper plates is now so well known, that they are very extensively used in place of the old copper plates, as they save their cost in a week or so. To quicksilver the plates, the mercury is rubbed on with a piece of flannel, using water, but no acid or cyanide of potassium. At these same works they have a process of removing gold from old copper plates without melting the plates. For this a charge of 10% of the gold obtained is made, saving the copper and allowing its value. Sometimes the old plates will pay for new silver plates. The old copper plates may be plated the same as new.

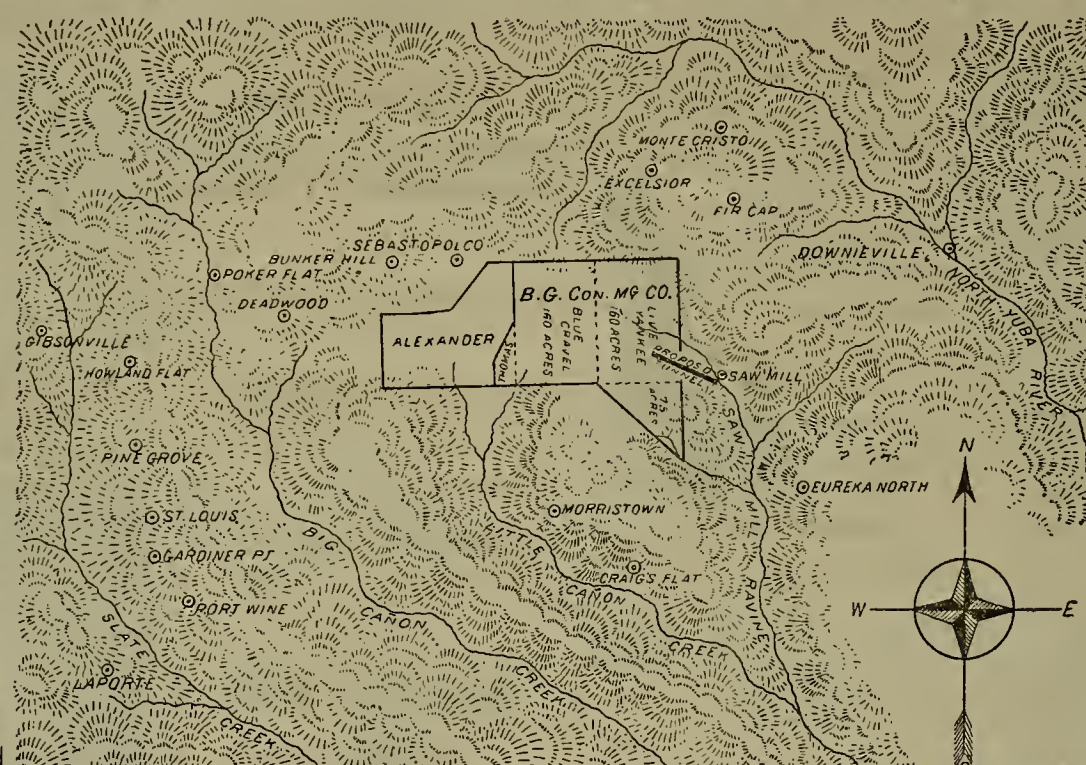

The foremen in the extensive foundries of Arlington, Yorkshire, who struck a short time since for an advance in their wages, have, to some extent, carried their point. The arbitrators appointed to decide the question between them and the masters have awarded them an increase of 7½% in their wages.

It is said that the prospects are good for the consolidation of the Raymond & Ely and Meadow Valley mining companies, at Pioche. This, of course, would put a stop to the trouble between the two companies that has existed for the past six years.

THE New York World, speaking of J. W. Mackay's arrival in Paris, says: At the conclusion of a prolonged tour in the East, he is expected to settle in New York.

THE Placerville gold quartz company have struck a bonanza in their shaft on the 600-ft. level. It is 90 ft. from the main ledge, but evidently leads to it.

A LARGE number of men are doing assessment work for themselves and others in the various mining camps.

MINING DISTRICTS IN SIERRA AND PLUMAS COUNTIES.

Porte and Port Wine, distant six miles. The way this property is to be opened will show how such enterprises are to be managed. The owners will convey the entire claims to a Trustee, to hold for a company to be formed by the investors who are to take charge of the property, construct the tunnel and such appliances as may be necessary to develop the claim.

The company is to have entire charge of their own expenditures, elect their own officers, agent and employees, and prosecute the work in their own way and at their own expense, but continuously and as expeditiously as possible, consistent with economical management.

When the tunnel is completed, claim opened and pay gravel obtained, the company is to have 250 shares more than one-half of the capital stock—or the controlling interest,—and the remainder belongs to the original owner or his assignees.

After pay gravel is obtained in the tunnel and the claims properly opened, and provided with necessary appliances for drift mining, should the claim not be self-sustaining and an assessment be required, all the stock or interests are to be assessed alike.

This arrangement is necessary for the reason that the owner requires capital to run the tunnel and open the claim. He therefore conveys the property on the conditions stated.

THE Salmon River mining and smelting company, have completed their smelter at the mouth of Kinikini, Utah, and everything is ready for the spring campaign. The Tribune says the company employs 12 men on the Silver Belle and 8 on the You Know mines, on Poverty flat. The ore now being extracted at the Silver Belle, samples 350 ounces silver per ton.

ties in Oregon report as above, but the yield of the State for that year was probably not less than \$1,000,000 in gold and \$10,000 in silver. Washington Territory is all that can be obtained from that source. The mine owners in nine counties in Idaho give their combined product as above. Six counties in Arizona report \$1,401,518.

Blanks are now being sent out to many companies, asking for information for the six months ending December 31st. As we have previously said, we hope that attention will be paid to the request of the mint officials, as all of the communications are held strictly private. Only the aggregate will be published.

The Gould & Curry Mine.

The annual meeting of the Gould & Curry Mining Co. was held this week, and the following trustees and officers elected: President, W. S. Hohart; Vice-President, A. B. Hull; Secretary, A. K. Durbrow; Superintendent, H. H. Penoyer. Directors—S. Heydenfeldt, George Coudon, Wm. Kohl, A. Hayward, Robt. Sherwood.

The Secretary's report shows the receipt of \$162,000 from assessments, and some \$38,000 from sales of supplies and machinery. The disbursements aggregate \$200,000, less \$15,000 on hand. The principal items of expense were \$18,314 for mill and mine supplies; \$15,000 for wood; \$32,975 for labor and salaries; \$77,250 for construction of Oshiston shaft.

The Superintendent, H. H. Penoyer, says that the machinery being in perfect order, and no unusual expense expected, the coming year should not be an unprofitable one. The joint B. & B. shaft has now attained a depth of 1900 feet; is entirely dry, and will be continued on down to a depth corresponding with the 2300 level of the C. & C. shaft; from which points our 2150' drifts and crosscuts will be run to determine the value of the ledge.

Mines of New Mexico.

The Silver City (N. M.) *Herald* says: Grant county is destined to be one of the richest, if not the richest, copper section in the world. At the east of Silver City lies Santa Rita, south and west the Burro mountains, in which new discoveries are being made and prospected with a great deal of energy.

Lone Mountain District.

Robert V. Newsham has struck a good streak of ore in his Gopher mine, assaying a large average in silver.

The Cossett mine remains closed, but for a short time only.

Santa Rita District.

The mines at Santa Rita will show their products in the market in a short time. Arrangements are being made to open up these copper veins, and it is felt that thorough work will be done in the development. These mines are well known and the copper has been of good quality.

At a point west of Santa Rita and near Fort Bayard, good copper indications have been discovered with assays running at a good average.

Burro Mountain District.

The assessment work is being done on the various copper locations. New discoveries are being made as the work of sinking shafts progresses, which give great encouragement. Messrs. Bullard & Co. are at work upon their claims and from results thus far, these copper mines appear to be of great value.

Lake Valley.

The Lincoln mine, owned by John A. Miller, shows a fair average ore. About a ton was lately reduced at the Mimbre works, running 584 ounces to the ton. Parties from New York and Washington have become interested and speak of putting considerable capital in developing.

Silver Flat.

The Mass. & New Mexico Mining Co.'s mill, running night and day, has reduced a large quantity of ore, and from the appearance of the amalgam one would judge it to be a fair quality. The machinery, since getting the smoothness and rough edges worn, is running with great ease and regularity, and all the employees are becoming accustomed to its peculiarities.

In going over the mine one finds a large quantity of ore assorted and stacked, they now having four men on the different dumps assorting, with more ore in the various shafts and drifts, which will be hoisted as the occasion requires. The water, which was a source of trouble some time ago, is such no longer, they having an abundant supply. As was reported a shipment of bullion was made by the managers about a week ago, and we understand another lot will be sent to the Boston office in due time.

Mill Work at Silver Reef, Utah.

We take the following remarks from a paper read recently before the American Institute of Mining Engineers, by Chas. M. Rolker:

Some of the ore slimes contain more than others. The limits lie about between 5% and 33%. I know of cases where 45 tons were stamped to get 30 tons for the pans. The folly of that is apparent, as settling tanks are cheaper than the cost of hauling it out of the slime-pits, with the cost of having hauled it from the mine, and the interest on the money while it must lie in the pit, added to it. However, this is being remedied fast.

The amounts of salt and bluestone used in milling are naturally very variable, according to the locality of the reefs from which it is taken. The limits probably lie between—bluestone, 1 2-10 lbs. to 5 lbs. per ton; salt, 15 lbs. to 50 lbs. per ton. The loss in quicksilver varies from 1 1-15 lbs. to 2 1-2 lbs. per ton.

The total cost of milling varies at the mills from \$3.55 to \$6 per ton, to which the cost of ore-hauling has to be added, except in case of the Barhee & Walker mine which has no ore-hauling charges. All, except the Stormont mill, are steam mills; it is also the only 10-stamp mill of the district. The stamps in use, when new, weigh 750 lbs., and with a fall of 6 inches make from 80 to 100 drops per minute. The batteries have 40-mesh screens. The Stormont mill has 6 blanket sluices, 130 ft. long, 14 inches wide, 5 inches deep, inclined under 3°—the only one in the camp. The pans of the district are rated at a ton and a half. The fineness of the bullion varies from 700 to 987 fine.

Tailings vary from \$3.25 to \$10 per ton, varying with the localities in the different reefs. Slimes are generally richer than the ores from which they are produced. The cost of mining is likewise variable, depending on the condition of the mines, i. e., on the amount of prospecting and dead work to be done, or the construction required, and ranges between the limits of \$4.50 and \$9.50 per ton. The total cost of these ores, including bullion charges, ranges from \$14 to \$17 per ton.

RAILROAD PROGRESS IN THE UNITED STATES.—*Railroad Gazette* of October 8th, reports the construction of 3,938 miles of new railroad up to that date during the present year, as against 2,328 miles constructed for the same period of 1879, 1,320 miles in 1875, 1,505 miles in 1877, and 1,719 miles in 1876. At the rate indicated, the year 1880 will not fall far short of 5,000 miles of new railroad.

Business Directory.

We furnish Telephones for \$10 per set. Wire, 75 cents per rod; Insulators, 15 cents each for every 200 feet of line. Illustrated instructions for putting up.

SAVE YOUR GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.

Machinery can be seen in operation every day at
No. 143 Fremont Street.

M. B. DODGE.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

GOLD SAVING SILVER PLATED

Amalgamating Plates,

**Scientific and Practical Books
on Mining, Metallurgy, Etc.**Published or Issued, wholesale and retail, by DEWEY &
CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including
the Chlorination Process for gold-bearing sulphurets,
arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Millman, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or-
der. It contains 120 diagrams, illustrating machinery
etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition)
and the Extraction of their Respective Metals without
Quicksilver. 1880.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed full
of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country and in
Europe, and explains the why and wherefore.
It contains 156 pages, embracing illustrations of furnaces,
implements and working apparatus.

It is a work of great merit, by an author whose reputation
is unsurpassed in his specialty.

Price, \$3.00 coin, postage free.

ST. DAVID'S,A FIRST-CLASS LODGING HOUSE
CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for
gentlemen and ladies visiting the city from the interior. No
dark rooms. Gas and running water in each room. The floors
are covered with body Brussels carpet, and all of the furniture
is made of solid black walnut. Each bed has a spring mat-
tress, with an additional hair top mattress, making them the
most luxurious and healthy beds in the world. Ladies wish-
ing to cook for themselves or families, are allowed the free
use of a large public kitchen and dining room, with dishes.
Servants wash the dishes and keep up a constant fire from
8 A. M. to 7 P. M. Hot and cold baths, a large parlor and read-
ing room, containing a Grand Piano—all free to guests. Price
single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars
to corner Third and Howard.

DODGE'S**UNEQUALLED****Concentrating Machinery**FOR CONCENTRATING GOLD, SILVER,
LEAD and COPPER ORES.

Furnaces for Roasting and Chloridizing Ores, for Amal-
gamation or Leaching.
Plans, Drawings and Estimates for Working Ores by
any Process.

235,417—DOOR HINGE—J. Decombe, S. F.
235,359—SEAL LOCK—Abraham Halsey, S. F.
235,433—THILL COUPLING—G. W. Hunter, Merced, Cal.
235,444—EXTRACTING CARTRIDGE SHELLS—James F. Marvin, Fort McDowell, Arizona.
235,573—WATER CLOSET VALVE—W. M. Sack, Oakland, Cal.

2,371—LABEL—Benj. Hastings, S. F.
2,373—LABEL—John R. Williams, Stockton, Cal.
FOR THE WEEK ENDING DECEMBER 14TH, 1880

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WATER CLOSET VALVE.—Wm. M. Sack, Oakland, Cal. Patented December 14, 1880. No. 235,573. This device consists in connecting with the supply and discharge pipe two oppositely placed pipes opening into opposite sides of a globe or water chamber carrying an elastic diaphragm, a four-way valve being placed at the junction of the four pipes, said valve being operated by a lever connected with the closet seat. On the depression of the lever by the weight on the seat the valve allows a certain amount of water to pass through one of the pipes into one side of the water chamber, the pressure of this water expelling that already in said chamber and discharging it into the bowl.

HINGES.—Joseph Decombe, 311 East street, S. F. Patented Dec. 14, 1880. No. 235,417. This device relates to improvements in hinges which are especially applicable to double doors, and it consists in a peculiar and novel construction in which two leaves of the hinge, one for each of two doors, are supported upon the same hinge pin; the latter being projected out from the point at which the hinge is secured, the thickness of the doors. This allows doors to be hung so that the post is reduced to a minimum, and is entirely concealed from the front when the doors are closed. When opened, only the thickness of the two doors, as they stand back to back, will be exposed. As many of these doors may be thus hinged in pairs as will extend across the space to be divided off. When opened they will throw the two contiguous apartments into one room with but little obstruction by reason of the posts and doors.

ECCENTRIC COUPLINGS.—Geo. W. Hunter, Merced, Cal. Patented December 14, 1880. No. 235,433. This device relates to a novel coupling which may be employed for various purposes, such as securing poles or shafts to vehicles, to the union of the lengths of rods, such are used in well boring and for other purposes. It consists of a rounded head secured to the front axle or the rod, or pole to be connected, having a hole in its center in which is fitted a short cylinder which will turn easily. This cylinder has a slot in one side, to receive the shaft iron or bolt, and the head has a slot to admit it; after which the cylinder is turned until the slot in the cylinder no longer corresponds with that in the head. Lugs upon the cylinder retain it in the head, and a spring latch prevents the head from turning to free the bolt.

WASHING MACHINE.—George M. Pursell, San Jose, Cal. Patented December 7, 1880. No. 235,168. This invention relates to certain improvements in that class of washing machines which consists of a semi-cylindrical containing body and a similarly-shaped rubber, which is adapted to be oscillated or rotated about an axis, so that the clothes may be rubbed between the corrugated surfaces of the two.

Bullion Shipments.

Under this heading we give all shipments since our last issue. We will be glad to receive further reports:

Northern Belle, Dec. 13th, \$6,358; Western, Dec. 14th, \$12,536; Northern Belle, Dec. 15th, \$6,080; Ontario, Dec. 13th, \$10,463; Stormont, Dec. 14th, \$6,711; Christy, Dec. 13th, \$2,244; Ontario, Dec. 14th, \$3,643; Horn Silver, Dec. 15th, \$5,000; Ontario, Dec. 15th, \$5,306; Christy, Dec. 15th, \$4,779; Barbee & Walker, Dec. 15th, \$1,781; Christy, Dec. 16th, \$2,334; Horn Silver, Dec. 16th, \$2,500; Ontario, Dec. 16th, \$3,719; Horn Silver, Dec. 18th, \$7,500; Ontario, Dec. 17th, \$4,291, 18th, \$3,948; Barbee & Walker, Dec. 18th, \$2,151; Con. Virginia, Dec. 18th, \$58,335; Northern Belle, Dec. 18th, \$9,027.15; Western, Dec. 18th, \$216,22.30; Northern Belle Isle, Dec. 20th, \$13,700; Grand Prize, Dec. 20th, \$11,600; Bodie, Dec. 20th,

Mechanics' Institute.

The Board of Trustees of the Mechanics' Institute have purchased for \$175,000 a lot 382x275 ft, between Polk, Laguna, Hayes and Grove streets. They have also decided to dispose of the old building on Post St. The old premises are worth upwards of \$100,000, and when they are disposed of the money will be paid on the new lot.

This move has been in contemplation for a long time. The quarters on Post St. are contracted, and the building not particularly well adapted for the purpose even of a library. The Institute has in its day had to put up a number of temporary structures for exhibition buildings, but it is now proposed to erect a permanent one on the lot recently acquired. They will probably hold another fair in the old building on Eighth St., next August, as they will need all the money they can raise to pay for the lot. Even then they will probably have to run in debt for a building.

It is the intention to put up a substantial brick, stone and iron building, large enough for exhibition purposes. In addition to the large main floor space they can have two galleries, and still have room for library and reading rooms. It will probably be three or four years yet before all these plans can be carried out, and by that time the City Hall will be perhaps nearly completed. The center of the town is gradually going in that direction and the Institute building will then be in a central location.

With a permanent building belonging to the Institute, the expense of the fair will be reduced greatly. They will probably not have such a needlessly large structure as they have now—one difficult to properly fill. Everything is spread over too much surface to have any neat and artistic appearance at the fairs held in the Eighth St. building; but in the new one closer scrutiny can be exercised.

The purchase of the new lot and the contemplated improvements are an evidence of progress on the part of the Mechanics' Institute at which all its friends will rejoice. The library is a favorite one, and the efficient librarian has exercised very good judgment in arranging the books so as to be convenient for the subscribers. The attendants are affable and courteous, and the whole institution deserves the success it has met and is meeting.

Elegant Christmas Cards.

We acknowledge the receipt of a box of elegant Christmas cards from L. Prang & Co., of Boeton. These cards are all beautiful and chaste in design, and executed in the highest style of the art. In addition to a large number of smaller ones of lesser note, we notice four large size cards, which are reproductions of the designs for Christmas cards, which received the prizes in the competition last spring held under the auspices of the American Art Gallery in New York.

The first of these four designs is by Miss Rosina Emmet, who received therefor the award of \$1,000. Upon this card is a panel upon which is represented five boyish choristers chanting the praises of the "New-born Child." This panel stands out upon the black ground of a larger and more dimly outlined picture, suitably embellished with figures and flowers, and verses.

The other three designs are also elaborate and artistic efforts, the authors of which were rewarded respectively with the sums of \$500, \$300 and \$200.

It is marvelous to notice, from the samples before us, the advance which has been made in this particular line of chromo-lithography, since Prang & Co., a few years ago, gave us their first attempts in the art, which consisted of nothing better than a stem of currants, a twig of the red berries of the barberry bush, a bunch of apple blossoms, or something of a similar kind, in one corner of a white or tinted card.

This improvement has grown out of the popular enthusiasm for decorative art, which has of late taken such a hold upon the masses everywhere, and which is doing so much to elevate and refine our people. It is to this firm, more than to any one other, that the public is indebted for this growing taste for art, and which is doing so much to create and perpetuate a warm-hearted feeling of good-fellowship between man and man. Let those who desire to cultivate this taste in their families and among their friends, unite in the time-honored observance of "Merrie Christmas" by a free circulation of these elegant greetings, which may be had in endless variety of Mr. J. H. Dorey, at 527 Commercial street.

THE Western Mining Co., Saturday, declared an extra dividend of 75 cents per share, or \$75,000, payable on the 20th. The regular dividend of the same amount was paid on the 10th. This is intended as a Christmas present to stockholders. The mine is in the Tomstone district, Arizona. It was formerly known as the Contention. Dividends of 75 cents per share were commenced last July, and have been paid every month since. The aggregate being

News in Brief.

TROOPS are being landed in Ireland. THE Basuto war is rapidly spreading. THE Kurde have returned to Turkish territory.

SCARLET FEVER and diphtheria are raging in New York.

THE steam dredger *Samson* is at work in Petaluma creek.

THREE eight shocks of earthquake at Los Angeles Sunday.

OR 150 cases of diphtheria in Brooklyn last week, 50 were fatal.

ACCORDING to the census returns, the population of Oregon is 174,767.

THE Queen has knighted Edward Baine, editor of the *Leeds Mercury*.

ENGLAND is likely to have another war on her hands in the Transvaal.

IT is proposed to divide Dakota, and make a State of the southern portion.

THE Little River mill, Mendocino county, have shut down for the winter.

EMILE DE GIRARDIN, the great French journalist has retired from public life.

THE peak of the St. Helena mountains were white with snow last Friday morning.

A SANGUINARY fight has taken place between the Armenians and the Turkish troops.

IT is again rumored that the Czar of Russia is about to abdicate in favor of the Czarevitch.

THE Second Chamber of Holland has voted a grant of 7,000 guilders for an Arctic expedition next year.

THERE is a good deal of defection in British Columbia, against the Dominion. Secession is talked of.

COMMODORE THOMAS S. PHELPS has been ordered to the command of the Mare Island Navy Yard.

A DISASTROUS fire has occurred at Rangoon, British India. The damage is estimated at 19 lacs of rupees.

THE New York *Herald* says: Gen. McDowell is a close personal friend of Garfield, and may be Secretary of War.

THE Boers of the Transvaal, South Africa, have thrown off the English yoke and re-established the Republic.

THE Russian Government has ordered 12 torpedo cutters, at a cost of £10,000, for the Russian fleet in Chinese waters.

TWO infernal machines were received last week by Hayward Bros., of Alameda. They fortunately did not explode.

A MANIFESTO against the Canada Pacific syndicate contract has been issued by the Opposition in the Dominion Parliament.

IT is proposed to make the anniversary of the discovery of America a national holiday, as far as possible, by act of Congress.

PRIVATE intelligence from Gen. Skobloff shows, in spite of all contrary assertions, that the Tekke campaign has already begun.

GOV. WILTZ of Louisiana has ordered the planters to take care of their own levees, as the State is unable to make the necessary repairs.

THE January interest from the Treasury Department will cause 70,000 checks to be issued. The payments will be \$15,731,000, but, added to other bond liabilities, it will equal \$24,000,000.

M. S. BEACH, while recently plowing in his field in the northern part of Marysville, turned up with the sod an old gold watch that had apparently been buried there many years.

THE New York Board of Health has prohibited public funerals in the case of persons dying of cholera, yellow fever, small-pox, scarlet fever or diphtheria. Such a prohibition should be universal.

THE Chief of the Bureau of Statistics reports the total value of exports of domestic breadstuffs for the 11 months ending November 30, 1880, to be \$256,762,380. For the same period in 1879 it was \$230,791,604.

AT San Diego grading has commenced on the first 18 miles from San Diego on the California Southern road. The ground is in fine condition, being softened by late rains. Seven large gangs of men are at work.

THE clergy of all the Roman Catholic and several of the Protestant churches of Montreal, Sunday, denounced Sara Bernhardt in strong terms, warning their people against patronizing her performances this week.

IT is officially announced that the allotment of Panama canal shares will be as follows: Applications for from one to five shares will be accepted in toto; subscribers for from 6 to 20 shares will receive 6%, and those from 20 upwards will receive 25% of their demands. Installments of 100 francs per share must be paid before the 30th inst.

A NUMBER of the Irish landlords are now advocating, as a compromise, the adoption of the "three F's" policy—meaning fair rent, fixity of tenure, and free sale. Lord Rossmore's meeting of Orangemen made this policy its platform. The London *Times* advocates this plan of settlement. Fixity of tenure was a year ago denounced by the landlords as utterly inadmissible.

THE antagonism between the proprietors of the coil and the tenants in Ireland is becoming more and more bitter. It is daily showing itself in the Boycotting of obnoxious landlords. The machinery of the law, which has been evoked in aid of the prescriptive rights of the sentry, is also clogged by the refusal of many of the smaller freeholders to appear at the As-

Quinine and Arsenic

Form the basis of many of the Ague Remedies in the market, and are the last resort of physicians and people who know no better medicine to employ for this distressing complaint. The effects of either of these drugs are destructive to the system, producing headache, intestinal disorders, vertigo, dizziness, ringing in the ears, and depression of the constitutional health. AYER'S AGUE CURE is a vegetable discovery, containing neither quinine, arsenic, nor any deleterious ingredient, and is an infallible and rapid cure for every form of Fever and Ague. Its effects are permanent and certain, and no injury can result from its use. Besides being a positive cure for Fever and ague in all its forms, it is also a superior remedy for Liver Complaints. It is an excellent tonic and preventive as well as cure, of all complaints peculiar to malarious marshy and miasmatic districts. By direct action on the liver and biliary apparatus, it stimulates the system to a vigorous, healthy condition.

FOR SALE BY ALL DEALERS

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. C. KNOX—Pacific Coast.
O. W. McOREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
N. E. BOYD—San Bernardino and Los Angeles counties.
JARED C. HOAG—California.
O. M. THOMPSON—Fresno county.
B. W. CROWELL—Colusa and Yolo counties.
D. W. KELLERHER—Fresno, San Benito, Monterey and San Luis Obispo counties.
W. O. WARNOCK, Sonoma County.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

INVENTORS, and others interested, will receive DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY Circular free on application at this office. It contains 42 pages of hints and information about Patents, Patent Laws, Patent Office Regulations, and how to obtain valid patents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

SPECIALTY FOR 30 YEARS.

WHOLESALE AND RETAIL.

The most complicated cases of defective vision thoroughly diagnosed, free of charge. Compound Astigmatic Lenses Mounted to order. 24 hours notice.

THE AMERICANIZED ARRASTRA.

This machine, used in connection with stamps, will allow their doing double the amount of work they otherwise should do. As the Arrastra does the thorough pulverizing—it releases the finer gold—and as the motion is slow, connected with other features, the very finest of gold is saved. The Arrastra used with batteries makes a most perfect mill, and will soon pay for itself. Circulars forwarded on request. ALMARIN B. PAUL, Room 20, Safe Deposit Building, San Francisco.

Cups for Engine, Machine and Shaft Bearings and Loose Pulleys. We furnish the Albany Compound (a solid), \$1 worth of which will last as long as from \$2 to \$10 worth of Oil, with no stop, and with one-twentieth the attention required by the best Oil Cups. If the Cups are not satisfactory, we will receive them back and make no charge.

Cylinder corrosion is not so much owing to impure tallow or oil as to the fact that these animal fats do not maintain their integrity under steam heat, but decompose and set free acids which attack and destroy metal.

The Albany Cylinder Oil does not contain fatty acids—is incapable of being decomposed and does not form insoluble soaps.

If it becomes mixed with boiler incrustation it diminishes its tendency to cling to the sides of the boiler, and thus exerts in this respect also a beneficial action.

THE ALBANY
Cylinder Oil

Is now in use throughout the world, and we refer to nearly all first-class establishments on this coast for evidence of its efficacy.

Pure Winter Strained Lard Oil

By every vessel from New York.

ALBANY SPINDLE OIL,

Genuine West Virginia Lubricating Oil,

SIGNAL OIL for outside lights of vessels, etc.

The Albany Lubricating Compound and Cups, the Albany Spindle Oil, etc., can only be gotten from us or our agents. Send for catalogues.

KNIGHT WATER WHEEL.

The large number of these wheels now in operation, all giving entire satisfaction, is a full guarantee for their superiority over all other Pressure Wheels.

All sizes for sale by

ALMARIN B. PAUL,

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from
prominent Architects in this city:

Believing that a journal of this kind is a necessity on this
coast, and judging from what has appeared in the "Quarterly
Architectural Review," we are led to believe that the
CALIFORNIA ARCHITECT AND BUILDING REVIEW
will be worthy of generous support and encouragement. We
therefore pledge our cordial sympathies, personally and hope
that the enterprise will receive kindly recognition and liberal
support from all Architects and Builders and the public gen-
erally. (Signed) David Farquharson, Wright & Sanders, S.
H. Williams, Thos. J. Welsh, P. Huernie, John Marquis, S.

No Drouths! Sure Crops!

READING RANCH, Shasta Co., Cal.

Good Land!
Sure Crops!
HEALTHY CLIMATE!
Prices Low. Terms Easy.
TITLE PERFECT.

Persons thinking of buying or renting land will not likely regret a camping or excursion trip to this upper Sacramento country.

The Reading Ranch, in the Upper Sacramento valley, originally embracing over 20,000 acres of choice grain, orchard and pasture land, is now offered for sale at low prices and on favorable terms of payment, in subdivisions to suit purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends over 20 miles along its bank.

The average rainfall is about 80 inches per annum, and crops have never been known to fail from drouth.

The climate is healthy and desirable. The near proximity of high mountain peaks give cool nights during the "heated term" which occurs in our California summers.

Pasture, wood and good water are abundant. The tillage land is mostly level, with complete drainage.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract without irrigation. Also, Alfalfa, Vegetables, Corn and all other cereals ordinarily grown in the State.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The title is U. S. patent. Prices range principally from \$5 to \$20 per acre.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading, all of which are located within the limits of the ranch.

The Sacramento River borders the whole tract on the southeast. Its clear waters are well stocked with fish. Good hunting abounds in the surrounding country.

Producers have a local market, which enhances the value of their produce. The railroad transportation route is level throughout to San Francisco. A portion of the land is auriferous and located near rich mines now being worked. Land suitable for settlers in colonies can be obtained on good terms.

Town lots are offered for sale in Reading, situated on the Sacramento river, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor.

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

Location of Shasta County.

Shasta County lies not far from midway between the two most important ports on the Pacific shore, i. e., San Francisco and Portland Oregon, and directly on the overland route, which in the future will become the grand thoroughfare from Mexico to British Columbia. The town of Redding, at present, and probably for years to come, the head of railroad transportation on the California side of the mountains intervening below Oregon, is distant from San Francisco by railroad (via Vallejo) 255 miles; from Sacramento City, 169 miles; from Marysville 117 miles.

LAND FOR SALE OR RENT IN SUB-DIVISIONS.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mill, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Sump Iron Work complete for Wood Frames, also.

**SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 800 pounds for Gold and Silver Ores, Wet or Dry Crushing Mortars.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

SECURE PATENTS

Through Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. **DEWEY & CO., PATENT AGENTS.**
